sixteenth, and of the greater part of the seventeenth century, has his monogram, more or less simple according to the taste or caprice of the designer; and to such a length was the practice carried, that the very excess produced a reaction, and led, for a time, to the abandonment of monograms altogether. With the painters of the eighteenth century, they fell into complete disfavour; and although, in the present century, the revival of ancient forms has led to their re-adoption in the German school, and among the cultivators of Christian art generally, yet many of the first painters of the present day seem to eschew the use of monograms, as savouring of transcendentalism, or of some other of the various affectations, by which modern art is accused of having been disfigured.

Independently altogether of its bearing upon art, the study of monograms has a certain amount of interest. There is a class of adventurers at the present day who make a livelihood from the curiosity or credulity of the public, by professing to decipher the peculiarities of an individual's character, and to read his probable destiny, in any specimen of his handwriting which may be submitted for their inspection. Without carrying the theory to these absurd lengths, it is impossible not to feel some interest about the autograph of any celebrated individual, and some tendency to compare its leading characteristics with our preconceived notions regarding him. A still wider field for speculation than that which grows out of the handwriting, is afforded by a device like the monogram, which, being in a great measure arbitrary, may naturally be expected to exhibit more decidedly the workings of the judgment, the fancy, or perhaps the caprice, of the artist.

The monogram, as we have seen, is a substitute for the full-length signature of the artist—the mode of marking their works originally adopted by the ancients. It is found in an almost infinite number of varieties.

The earliest, as well as the most natural and easy substitute, was a simple contraction of the name—as, 'angs ca.,' for Augustinus Caraccius; or JVL. ROM., for Julius Romanus. This contraction, however, cannot properly be called a monogram at all; and the same is to be said of the form of signature adopted by many of the most eminent painters—the simple, unconnected initials of the name. The idea of a monogram supposes that the characters, whatever may be their number considered separately, shall be all connected so as to form one single device.

The first such form which will occur to one's mind is the mere combination of the initial letters of the name—as, for example, AB, or AK, which are the actual monograms of Andrew Both, the celebrated Flemish landscape painter, and of Antony Kölbl, a distinguished Austrian artist of more modern times. In some instances, the monogram is found appended to the full signature of the artist, as in Albert Dürer's beautiful engraving of Adam and Eve, and in other less celebrated works, especially those of the early engravers. It is to be observed, however, that some artists were by no means uniform in the style of monogram which they employed. The device of the same artist often varies, not only in the size and figure of the letters which form it, but sometimes even in the letters themselves. Many artists have employed two, three, four, and even a greater number of devices; and of the celebrated engraver just named, Albert Dürer, we ourselves have

seen not less than thirty different modifications of the letters A D, the initials of his name.

These combinations are seldom so simple and intelligible as in the signature of Andrew Both, referred to above. In most of the earlier monograms, the initial of the family name is smaller than that of the Christian name. It is so in that of Albert Dürer; and it is remarkable that, through all the modifications of his signature which we have been able to discover, this characteristic is maintained—the D being invariably the smaller, and, as it were, the subordinate letter. Very often, one of the letters—generally the initial of the surname—is enclosed within the lines of the other. This peculiarity is also observable in Albert Dürer's signature; and we only know one single instance, among the numberless ones that occur, in which he has not maintained it.

In progress of time, it became fashionable to combine, not the initials merely of the name, but sometimes the most important letters, sometimes even all the letters, of the full name. Many of the monograms thus constructed would prove a puzzle even to the most accomplished decipherer, especially those in which the whole of the letters are not given, but only the most striking of them, and these, as very frequently occurs, not in their natural order. Sometimes the artist combined with the initials of his name that also of his place of birth or residence. It need scarcely be said that, especially in the earlier period, when the place of birth formed almost an invariable adjunct of the name, this practice also existed, even when the signature was given at full length.

A difficulty is sometimes created by the discovery of the letter V—very frequently smaller than the other letters of the monogram—between the initials of the artist's name. It occurs in the signatures of Flemish or German artists, and represents the *van* or *ron*, which, in the usage of these countries, was the characteristic of nobility. It is seen in the monogram of Esaias van de Velde, and is introduced rather curiously in that of Adrian van der Venne, who lived through the greater part of the seventeenth century. In this interesting monogram, the small v is inserted in the head of the large one, so as to form a figure not unlike one of the masonic emblems.

Sometimes the identity of the initial letter of the surname with that of the Christian name gives rise to a curious device in their combination. Thus, the signature of Francis Floris, a German engraver, who died about the middle of the seventeenth century, reverses the former of the two FFs, placing them back to back, with the down stroke common to both letters; while that of Francis Frederic Frank, in which the same letter is three times repeated, drove the ingenuity of the artist to a still more curious combination—the three letters being kept perfectly independent, yet interlaced, or rather overlapped, so that their lines exhibit a figure which has the curious property, like the cabalistic Abracadabra, of presenting the same appearance from whatever point it may be viewed.

Another, and often more puzzling uncertainty, may arise out of the practice of adding to the ordinary letters of the name, the initials F, P, D, or I—representing *fecit*, *pinxit*, *delineavit*, or *invenit*. Without adverting to this circumstance, few would recognise the distinguished name of Anthony van Dyck, in the monogram which he habitually employed, and of which the F seems to form a principal part; or that of our dear old friend, Hans Hemling, in the still more perplexing symbol by which his very best works may be distinguished. But besides the variations of which the

letters are susceptible when grouped in this manner, many of the artists have indulged in a variety of strange and puzzling accompaniments.

A more interesting class of monograms are those which employ symbols instead of letters; or, what is not uncommon, use both letters and symbols in combination. Many of these resemble the illustrated enigmas which have become fashionable in the pictorial journals both of England and of foreign countries, and of which Mr Knight, in the last issue of his *Penny Magazine*, set so beautiful an example in the poetical enigmas of Mr Mackworth Praed. The general character of this class will be sufficiently indicated by the example of the Italian painter, Palma, whose name is translated *palm*, and who used the emblem of a *palm* as well as the initial of his family name; or the still more characteristic one of a painter of Tübingen, Jacob *Züberlein* (*little tub*), who appended to his literal monogram the simple and striking, though not very graceful, emblem of a *tub*.

The several classes which are here slightly indicated, contain under them many subordinate varieties, which it would be tedious to enumerate, and which, indeed, it would be almost impossible to classify. It is a remarkable circumstance, however, in the history of art, that the signatures of the most distinguished painters are precisely those which, for themselves, and for their forms, possess the least interest. With few exceptions, it may be said of the great painters, that they appear to have avoided the affectation of the use of monograms; and certainly that those who did employ them, selected the very simplest and least fantastic forms. The greatest masters of the art—Michael Angelo, Raphael, Titian, Guido, Domenichino, Paul Veronese, Rubens, Guercino, Agostino Caracci, and many hardly less distinguished artists—either omitted to sign their pictures at all, or signed their name at full length, sometimes with the addition of their local surname, or employed the initial syllables or letters of their name in the ordinary Roman form, without any attempt at grouping them into a monogram. Even Salvator Rosa, with all the wildness and extravagance of his manner, used an exceedingly simple combination of the initials of his name. The monogram of the great Spanish painter, Bartholomew Esteban [Stephen] Murillo, consists simply of the three initial letters of the name, signed in the common Roman character, and combined with perfect simplicity, except that there is a curious inversion of their order. That of his countryman, Joseph Ribera—better known as *Espagnoletto*—is merely the combination of the same letters, written in a cursive hand; and his signature is even occasionally found at full length, or very slightly abridged.

There is one curious exception to this general preference for simplicity among the masters of the first class—that of the celebrated Anthony Allegri, more commonly known under his surname, Correggio. This eminent painter did not think a pun beneath the dignity of his art, and, accordingly, the device by which he distinguishes his pictures consists of a punning symbol, representing his name. We need hardly explain to our readers that *Correggio* may be read *Cor* (*cuore*) *Reggio* (*Royal Heart*). The painter has expressed this pun in two different ways: by the figure of a heart, with the word *Reggio* inscribed upon it in Roman letters; and again by the still more punning emblem of a heart surmounted by a crown, or, it should rather be said, of a crowned, and therefore royal, heart. In confirmation, however, of the general tendency to simplicity which we have observed as prevailing among his great contemporaries, we should add that some of Correggio's pictures are signed with the initial syllables of his name, printed in the ordinary Roman character.

It is perhaps more remarkable, that even among the

humorists the same simplicity should have prevailed. Our own Hogarth, both the Tenierses, Hans Holbein, Ostade, even Callot himself, with all his extravagant and capricious fantasies, fall into the general rule; and the lady artists, Diana Chisi, Angelica Kaufmann, and Anna Maria Schurman, may be cited as equally exhibiting the same simplicity. There are some, indeed, in whom this affectation of simplicity goes almost to the length of rudeness. A charming cabinet picture, in the possession of the writer of these pages, by the celebrated Philip Wouvermans, well known for the familiar 'gray horse' which characterises all his pictures, is scratched with a P. W. which would disgrace the lowest form in a charity school. And, with every allowance for haste and indifference, it is impossible not to suspect something like affectation in the rude and sprawling signatures which we sometimes find, not only in ancient, but even in comparatively modern artists.

It would carry us far beyond our allotted limits to pursue further the examination of individual monograms. But there are some in the class of symbolical monograms, already referred to, which we must notice more in detail. Most of the monograms of this class, like that of Correggio, given above, involve a pun, sometimes, indeed, not a very recondite one. Thus the French artist, Jacob *Stella*, who died in 1647, invariably signs his pictures with a *star*—a device which the modern artist, Frederic *Morgenstern*, has applied to himself, representing his own name by the letter M, prefixed to the same symbol.

In the same way, an ancient artist, Lauber (leaf-gatherer), adopted a leaf (in German, *Laub*), as his symbol. Hans Weiner, in allusion to the genial beverage from which his name is derived, marked his works with the sign of a bunch of grapes. David Vinkenbooms (Anglice, tree-finch), a Dutch painter of the sixteenth century, took a 'finch perched upon a branch of a tree' as his pictorial emblem. Birnbaum (pear-tree) employed a similar emblem; while the monogram of Bernard Graat, a Dutch painter, who lived in the end of the seventeenth century, though utterly without significance to an English eye, would at once suggest the name of the painter to his own countrymen: Graat, in Dutch, signifying the spine of a fish, represented in this curious monogram.

The history of another emblem is perhaps still more remarkable. By a singular and perhaps humorously intended coincidence, three German painters, George Hufnagel, Sebastian Scharnagel, and John Nothnagel, have all employed the same homely emblem—a nail; the German name of which, *Nagel*, enters into the composition of all three surnames. Hufnagel (hoof-nail) has signed his pictures with a horse-shoe nail, sometimes crossed, sometimes curiously intertwined with the letters of his Christian name. Scharnagel has combined with a nail the figure of a spade or shovel (*schar*); while Nothnagel distinguishes himself from both by prefixing the letter N to their common emblem.

There is more of delicacy and ingenuity in the device employed by a female wood-engraver in the beginning of the sixteenth century, Isabella Quatrepomme (four-apple.) She was accustomed to sign her works with a neat and spirited sketch of an apple, marked with the numeral IV. This mark is found upon some old French woodcuts still in existence. There was some similar allusion, we have no doubt, concealed in the device of John Maria Pomedello, an Italian engraver of the time of Leo X. and Clement VII.; it has occasioned much speculation to the learned in these matters, but we must confess our inability to decipher all its significance. Nor was the use of these punning emblems confined to masters of the fine arts. Printers, too, frequently introduced them. The symbols of the olive, the sword, the dolphin, &c. so familiar to all bibliographers, had their origin in this

fanciful taste; and a more direct example than any—the leading feature of which is a rude image of a spur—is to be found in the imprint of the curious old German books published by Hans Sporer (spur-maker) during the very first years after the introduction of printing into Germany. Editions of books, with this characteristic imprint, still reckon among the choicest gems in a German book-collector's library, of what the amateurs in this department have chosen to call *Iacynabehn*.

To those who have given any attention to the deciphering of illustrated enigmas, many of the early monograms might furnish considerable amusement. That of the rather obscure artist, Colioloro, is a perfect counterpart of the most elaborate and fanciful of the modern enigmas. The curious combination, not alone of words, but of single letters, with the pictorial emblems, is fully as fanciful as any which we remember to have seen, even among those of the *Leipziger Illustrirte Zeitung*, which seems to bestow more attention on the subject than any of its contemporaries.

It must be remembered, that the artist's full name is Artigli Coscia Colioloro. The device begins with a confused heap of birds' claws, paws of animals, &c.; next appears a thigh, cut short above the knee; this is followed by the letter C. Next in order is seen a flask pouring out a stream of oil; the letter l, with a comma above the line, comes next; and the whole is closed by a goodly heap of gold pieces. To an Italian scholar, it is hardly necessary to offer an explanation. The group of emblems at the left hand represents Artigli (limbs); the rude image which succeeds it stands for Coscia (a thigh); the C, followed by the little flask of oil (*olio*), forms Colio; and the l, with the comma, or rather the mark of apostrophe, followed by the heap of gold pieces (*oro*)—making together l'oro, completes the characters of the name—Artigli Coscia Colioloro.

It will not, however, be a matter of surprise, that the key to many of these emblems has, in the course of time, been lost; and that at present a considerable number of this class of monograms are a mystery even to the most learned in the art. Notwithstanding every appliance, the monogrammatists have occasionally been forced to confess themselves in doubt, and sometimes altogether at fault, as to the identification, or even the interpretation, of some of the emblems.

During the latter part of the seventeenth century, and the whole of the eighteenth, the monogram went almost entirely out of fashion. In England, even still, its use is far from being general; and engravings, especially, are now-a-days almost invariably signed with the full name. But foreign artists, and particularly those of the *renaissance*, have revived the old usage. Frederic Overbeck, the great father of the Christian school of art: Cornelius, to whose magnificent conceptions Munich and Berlin owe their most glorious works, both historical and imaginative—as the fresco illustrations of the *Nibelungen Lied*, in the Royal Palace; the 'Last Judgment,' in the Ludwig-Kirche; and the 'History of St Boniface,' in the Bonifaz-Kloster—Storr, the great Austrian master, whose conception of 'Faust,' in the Royal Gallery at Vienna, is in itself a great poem; and the whole Düsseldorf school—have conformed to the ancient type. Even the humorists have made it, in some instances, a vehicle of their humour. Few of those who were wont to enjoy Richard Doyle's inimitable sketches in *Punch*, whose guiding-spirit he used to be, can forget the funny little figure, surmounted by his well-known initials; and the lovers of political caricature must often have smiled over the quizzical-looking gentleman who used to figure at the right-hand corner of HH's admirable sketches. But we doubt whether the fashion is destined to be ever fully restored, or whether the monogram is not rather doomed to remain a thing of the past—a

subject of speculation for that laborious, though not very practical class,

'Who delve 'mid nooks and sinuosities,
For literary curiosities.'

CLARET AND OLIVES.*

'WINE and Walnuts' was a good title for a gossiping book; 'Claret and Olives' is a better. It has a more decided flavour, a more elegant bouquet, a more gem-like colour. The other might refer to any denomination of that multitudinous stuff the English drink under the name of wine; or, if it has individuality at all, it relishes curiously of the coarse and heavy produce of Portugal, so beloved of Dr Johnson, and many other grave doctors, down to the last generation. This breathes all over of the sweet South; it babbles of green fields; it is full of gaiety and frolic, of song and laughter, and the sparkle of wit and crystal. The title, we say, is a good title; and the book has an unmistakable claret flavour—the best English claret, that is to say—which unites the strength of Burgundy with the bouquet of Château Margaux. Mr Reach despises a weak thin wine, and, by an idiosyncratical necessity, he has produced a sparkling, racy book. He traces the falling-off in our literature to a change in wine. 'The Elizabethans quaffed sack, or "Gascoyne, or Rochel wyn,"' quoth he; 'and we had the giants of those days. The Charles II. comedy writers worked on claret. Port came into fashion—port sapped our brains—and, instead of Wycherly's *Country Wife*, and Vanbrugh's *Relapse*, we had Mr Morton's *Wild Oats*, and Mr Cherry's *Soldier's Daughter*. It is really much to the credit of Scotland, that she stood stanchly by her old ally, France, and would have nothing to do with that dirty little slice of the worst part of Spain—Portugal, or her brandified potatoes. In the old Scotch houses, a cask of claret stood in the cellar, on the tap. In the humblest Scotch country tavern, the pewter *tappit hen*, holding some three quarts, "reamed," *Anglicè*, mantled, with claret just drawn from the cask. At length, in an evil hour, Scotland fell—

"Bold and erect the Caledonian stood,
Firm was his mutton, and his claret good;
'Let him drink port!' the English statesman cried;
He drank the poison, and his spirit died!"

This will look like treason to a good many of our readers; but we beg them to reflect, that in preferring claret to port, Mr Reach is, after all, an advocate of temperance; and they may therefore hope, that by degrees his potations will become thinner and thinner, till they at last come down—like Mike Lambourne's intentions—to water, 'nothing save fair water.' Our belief, indeed, is, that the excessive duty placed on French wines is a main cause of intemperance in its modern forms; for the dearth of the article drives people to spirits, and other intoxicating agents. Let the light claret (*vin ordinaire*) of France become a cheap and accessible drink, and we say advisedly that there would soon be a marked improvement in the matter of general sobriety.

As our author proceeds towards the claret district—for the book is in the form of a tour—he chats away very agreeably about everything he sees on the road. We shall not meddle, however, with this part of the volume, otherwise than to notice a peculiarity we have ourselves been frequently struck with—the countryness of small towns in France. There is no aristocracy to be met with there, no higher classes to set the fashion, no professional functionaries to look up to. 'You hardly see an individual who does not appear to have been born and bred upon the spot, and to have no ideas and

* *Claret and Olives, from the Garonne to the Rhone; or, Notes, Social, Picturesque, and Legendary, by the Way.* By Angus B. Reach. London: David Bogus. 1859.

no desires beyond it. Left entirely to themselves, the people have vegetated in these dull streets from generation to generation, and, though clustered together in a quasi town—perhaps with octroi and mairie, a withered tree of liberty, and billiard-tables by the half-dozen—the population is as essentially rural as though scattered in lone farms, unvisited, except on rent-day, by either landlord or agent.

After reaching Bordeaux, the tourist proceeded to the village of Margaux, in the true claret country—a general idea of which he gives by describing it as a debatable ground, stretching between the sterile Landes and the fat, black loam of the banks of the Garonne. The soil is sand, gravel, and shingle, scorched by the sun, and would be incapable of yielding as much nourishment to a patch of oats as is found on 'the bare hillside of some cold, bleak, Highland croft.' On this unpromising ground, grow those grapes which produce the finest wine in the world. As for the vines themselves, they have about as much of the picturesque as our drills of potatoes at home. 'Fancy open and unfenced expanses of stunted-looking, scrubby bushes, seldom rising two feet above the surface, planted in rows upon the summit of deep furrow-ridges, and fastened with great care to low, fence-like lines of espaliers, which run in unbroken ranks from one end of the huge fields to the other. These espaliers or lathes are cuttings of the walnut-trees around; and the tendrils of the vine are attached to the horizontally running stakes with withes, or thongs of bark. It is curious to observe the vigilant pains and attention with which every twig has been supported without being strained, and how things are arranged so as to give every cluster as fair a chance as possible of a goodly allowance of sun.' There are some exceptions to this; but the low regular dwarfs are the great wine-givers. 'Walk and gaze, until you come to the most shabby, stunted, weazened, scrubby, dwarfish, expanse of snobbish bushes, ignominiously bound neck and crop to the espaliers like a man on the rack—these utterly poor, starved, and meagre-looking growths, allowing as they do the gravelly soil to shew in bald patches of gray shingle through the straggling branches—these contemptible-looking shrubs, like paralysed and withered raspberries, it is which produce the most priceless, and the most inimitably flavoured wines.' The grapes are such mean and pitiful grapes as you would look at with contempt in Covent-Garden Market; and the very value of the soil contributes to its appearance of destitution—a rudely-carved stake marking the division of properties where a hedge or ditch would take up too much of the precious ground. The vineyards extend to the roadside, without any protection; and yet every living creature, whether man or animal, eats grapes habitually, morning, noon, and night, and to an excess that is perfectly wonderful.

When the fruit is ripe, the fact is announced to the community 'by authority;' and until the proclamation appears, no man must gather his grapes if they should be dropping from the bushes. The signal, however, is at length given, and the work begins. 'The scene is at once full of beauty, and of tender and even sacred associations. The songs of the vintagers, frequently chorused from one part of the field to the other, ring blithely into the bright summer air, pealing out above the rough jokes and hearty peals of laughter shouted hither and thither. All the green jungle is alive with the moving figures of men and women, stooping among the vines, or bearing pails and basketfuls of grapes out to the grass-grown cross-roads, along which the labouring oxen drag the rough vintage-carts, groaning and cracking as they stagger along beneath their weight of purple tubs, heaped high with the tumbling masses of luscious fruit. The congregation of every age and both sexes, and the careless variety of costume, add additional features of picturesqueness to the scene.

The white-haired old man labours with shaking hands to fill the basket which his black-eyed imp of a grand-child carries rejoicingly away. Quaint, broad-brimmed straw and felt hats; handkerchiefs twisted like turbans over straggling elf-locks; swarthy skins tanned to an olive-brown; black flashing eyes; and hands and feet stained in the abounding juices of the precious fruit—all these southern peculiarities of costume and appearance supply the vintage with its pleasant characteristics. The clatter of tongues is incessant. A fire of jokes and jeers, of saucy questions and more saucy retorts—of what, in fact, in the humble and unpoetic, but expressive vernacular, is called "chaff"—is kept up with a vigour which seldom flags, except now and then, when the but-end of a song, or the twanging close of a chorus, strikes the general fancy, and procures for the *morceau* a lusty *encore*. Meantime, the master wine-grower moves observingly from rank to rank. No neglected bunch of fruit escapes his watchful eye; no careless vintager shakes the precious berries rudely upon the soil, but he is promptly reminded of his slovenly work. Sometimes the tubs attract the careful superintendent: he turns up the clusters, to ascertain that no leaves nor useless length of tendril are entombed in the juicy masses, and anon directs his steps to the pressing-trough, anxious to find that the lusty treaders are persevering manfully in their long-continued dance.

The pressure of the grapes is a curious part of the process in an age of mechanical improvement like the present. It is performed by men treading among the fruit with their naked feet. 'The wine-press, or *cuvier de pressoir*, consists, in the majority of cases, of a massive shallow tub, varying in size from four square feet to as many square yards. It is placed either upon wooden trestles, or on a regularly built platform of mason-work, under the huge rafters of a substantial outhouse. Close to it stands a range of great butts, their number more or less, according to the size of the vineyard. The grapes are flung by tub and caskfuls into the *cuvier*. The treaders stamp diligently amid the masses, and the expressed juice pours plentifully out of a hole level with the bottom of the trough into a sieve of iron or wicker-work, which stops the passage of the skins, and from thence drains into tubs below. Suppose, at the moment of our arrival, the *cuvier* for a brief space empty. The treaders—big, perspiring men, in shirts and tucked-up trousers—spattered to the eyes with splashes of purple juice, lean upon their wooden spades, and wipe their foreheads. But their respite is short. The creak of another cart-load of tubs is heard, and immediately the wagon is backed up to the broad open window, or rather hole in the wall, above the trough. A minute suffices to wrench out tub after tub, and to tilt their already half-mashed clusters splash into the reeking *pressoir*. Then to work again. Jumping with a sort of spiteful eagerness into the mountain of yielding, quivering fruit, the treaders sink almost to the knees, stamping, and jumping, and rioting in the masses of grapes, as fountains of juice spurt about their feet, and rush bubbling and gurgling away. Presently, having, as it were, drawn the first sweet blood of the new cargo, the eager tramping subsides into a sort of quiet, measured dance, which the treaders continue, while, with their wooden spades, they turn the pulpy remnants of the fruit hither and thither, so as to expose the half-squeezed berries in every possible way to the muscular action of the incessantly moving feet. All this time, the juice is flowing in a continuous stream into the tubs beneath. When the jet begins to slacken, the heap is well tumbled with the wooden spades, and, as though a new force had been applied, the juice-jet immediately breaks out afresh. It takes, perhaps, half or three quarters of an hour thoroughly to squeeze the contents of a good-sized *cuvier*, sufficiently manned.'

In defence of this primitive process, it is alleged that no mechanical wine-press could perform the work with the same perfection as the human foot; and as for the impurities the juice may acquire from any want of cleanliness in the operations, these, and every other atom of foreign matter, are thrown to the surface in the act of fermentation.

The expressed juice is now carried away in tubs, and flung into the fermenting vats. Our author saw the vats in the Château Margaux cellars the day after they had been filled, and heard, deep down, 'perhaps eight feet down in the juice, a seething, gushing sound, as if currents and eddies were beginning to flow, in obedience to the influence of the working spirit; and now and then a hiss and a low bubbling throb, as though of a pot about to boil.' In a little while, it would have been impossible to breathe an atmosphere thus saturated with carbonic acid gas; and the superintendents can only watch the process of nature by listening outside the door to 'the inarticulate accents and indistinct rumblings' which proclaim a great metempsychosis. 'Is there not something fanciful and poetic in the notion of this change taking place mysteriously in the darkness, when all the doors are locked and barred—for the atmosphere about the vats is death—as if nature would suffer no idle prying into her mystic operations, and as if the grand transmutation and projection from juice to wine had in it something of a secret and solemn and awful nature—fenced round, as it were, and protected from vulgar curiosity by the invisible halo of stifling gas?'

The vintagers naturally claim our attention next. A portion of them are, of course, the peasantry of the village and neighbourhood; but a country like France, swarming with poor who are not mendicants, has of course a floating population, that surges almost instinctively upon every spot where there is pleasant work to do. The vintage not merely affords this work, but being attended with all sorts of jollity, the crowds it collects have a peculiarly vagabond character. You see at a glance that they are there upon a spree, and submit to the labour, not as anything they like, or are accustomed to, but as a mere passport to the fun. They are in France what the Irish harvesters and the Kent hop-pickers are in England, although always preserving the peculiarities that distinguish the former country, giving even her vagabondage a melodramatic look, just as if they were 'made up' for the occasion. 'The gendarmerie,' says our author, 'have a busy time of it when these gentry are collected in numbers in the district. Poultry disappear with the most miraculous promptitude; small linen articles hung out to dry have no more chance than if Falstaff's regiment were marching by; and garden fruit and vegetables, of course, share the results produced by a rigid application of the maxim, that *la propriété c'est le vol*. Where these people come from is a puzzle. There will be vagrants and strollers among them from all parts of France—from the Pyrenees and the Alps—from the pine-woods of the Landes and the moors of Brittany. They unite in bands of a dozen or a score men and women, appointing a chief, who bargains with the vine-proprietor for the services of the company, and keeps up some degree of order and subordination, principally by means of the unconstitutional application of a good thick stick. I frequently encountered these bands, making their way from one district to another; and better samples of 'the dangerous classes' were never collected. They looked vicious and abandoned, as well as miserably poor. The women, in particular, were as brazen-faced a set of slatterns as could be conceived; and the majority of the men—tattered, strapping-looking fellows, with torn slouched hats and tremendous cudgels—were exactly the sort of persons a nervous gentleman would have scruples about meeting at dusk in a long lane. It is when thus on the tramp that the petty pilfering, and

picking and stealing, to which I have alluded to, goes on. When actually at work, they have no time for picking up unconsidered trifles. Sometimes these people pass the night—all together, of course—in out-houses or barns, when the *chef* can strike a good bargain; at other times, they bivouac on the lee-side of a wood or wall, in genuine gipsy fashion. You may often see their watchfires glimmering in the night; and be sure that where you do, there are twisted necks and vacant nests in many a neighbouring henroost.' Mr Reach witnessed an altercation, respecting passage-money, between a party of these wanderers and a ferryman of the Garonne; and it ended in the vintagers refusing to cross the river, rather than submit to the overcharge, as they contended it was, of a sou. 'A bivouac was soon formed. Creeping under the lee of a row of casks, on the shingle of the bare beach, the women were placed leaning against the somewhat hard and large pillows in question; the children were nestled at their feet and in their laps; and the men formed the outermost ranks. A supply of loaves was sent for and obtained. The chief tore the bread up into huge hunks, which he distributed to his dependents; and upon this supper the whole party went coolly to sleep—more coolly, indeed, than agreeably—for a keen north wind was whistling along the sedge banks of the river, and the red blaze of high-piled fagots was streaming from the houses across the black, cold, turbid waters.'

If our author's picture of the vine is not *couleur de rose*, he is still less complimentary to the olive. Languedoc is the country of the latter luxury; and Languedoc is in the south of France—aptly termed 'the austere south.' 'It is austere, grim, sombre. It never smiles: it is scathed and parched. There is no freshness or rurality in it. It does not seem the country, but a vast yard—shadeless, glaring, drear, and dry. Let us glance from our elevated perch over the district we are traversing. A vast, rolling wilderness of clodded earth, browned and baked by the sun; here and there masses of red rock heaving themselves above the soil like protruding ribs of the earth, and a vast coating of drowsy dust, lying like snow upon the ground. To the left, a long ridge of iron-like mountains—on all sides rolling hills, stern and kneaded, looking as though frozen. On the slopes and in the plains, endless rows of scrubby, ugly trees, powdered with the universal dust, and looking exactly like mop-sticks. Sprawling and straggling over the soil beneath them, jungles of burnt-up, leafless bushes, tangled, and apparently neglected. The trees are olives and mulberries—the bushes, vines.' This is a picture that will not impress an Englishman with the due sensation of dreariness, unless he recollects that in France there are no enclosures—that the country lies spread out before him, in some parts and seasons, like a richly variegated carpet; in others, like an Arabian desert. The romantic, Eastern, Biblical olive!—what is it? 'The trunk, a weazened, sapless-looking piece of timber, the branches spreading out from it like the top of a mushroom; and the colour, when you can see it for dust, a cold, sombre, grayish green. One olive is as like another as one mop-stick is like another. The tree has no picturesqueness, no variety. It is not high enough to be grand, and not irregular enough to be graceful. Put it beside the birch, the beech, the elm, or the oak, and you will see the poetry of the forest, and its poorest and most meagre prose.'

The mop-stick appearance of the olive is an artificial beauty; to make it look like an umbrella is the *ne plus ultra* of arboriculture. But the present race of olives, twist and torment them as we will, are inferior to those of the times of our grandfather. 'Towards the close of the last century, there was a winter night of intense frost; and when the morning broke, the trees were nearly smitten to the core. That year, there was not an olive gathered in Provence or Languedoc. The

next season, some of the stronger and younger trees partially revived, and slips were planted from those to which the axe had been applied; but the entire species of the tree had fallen off—had dwindled, and pined, and become stunted; and the profits of olive cultivation had faded with it.' Olive-gathering, it will be felt, is a slow affair. The getting in this harvest is 'as business-like and unexciting as weeding onions, or digging potatoes. A set of ragged peasants—the country people hereabouts are poorly dressed—were clambering barefoot in the trees, each man with a basket tied before him, and lazily plucking the dull oily fruit. Occasionally, the olive-gatherers had spread a white cloth beneath the tree, and were shaking the very ripe fruit down; but there was neither jollity nor romance about the process. The olive is a tree of association, but that is all. Its culture, its manuring and clipping, and trimming and grafting—the gathering of its fruits, and their squeezing in the mill, when the ponderous stone goes round and round in the glutinous trough, crushing the very essence out of the oily pulps, while the fat oleaginous stream pours lazily into the greasy vessels set to receive it; all this is as prosaic and uninteresting, as if the whole Royal Agricultural Society were presiding in spirit over the operations.'

Our readers will now see that this is a racy, vigorous book, full of new remark and clever painting; and we recommend them to test the correctness of our opinions, therefore, by having recourse to the volume itself, which is neither large nor expensive.

THINGS TALKED OF IN LONDON.

April 1852.

A good many comments and congratulations have passed of late touching the change of system introduced into one of our official strongholds, which dates from the days of the Plantagenets, perhaps earlier; for Sir J. Herschel, as Master of the Mint, has made his first Report to the Lords of the Treasury concerning the money-coining establishment over which he presides, with little ostentation, but much benefit. According to the Order in Council, issued in March of last year, the Mint-Board, the contract with the melter, and the moneyers' privileges, were all abolished, and a new system of business introduced. The melter's arguments in favour of retaining his portion of the establishment were not successful, as it has been found that the melting and refining can be done much cheaper at private works; and the melting department is now separated from the Mint, and leased, it is said, to one of the Rothschilds. Of course, the dispossessed functionaries get compensation and pensions, as also the moneyers' apprentices, who had paid L.1000 to learn the 'art and mystery,' with the prospect of one day becoming members of the fraternity. The coining is still to be carried on on the premises, as the contracts offered for doing the work out of doors were too high or too incompetent; the 'engraver or die-sinker' is no longer to be permitted to work on his own private account; and, what is still better, when a new medal or new model is wanted, the best artists of the country are to have the opportunity of shewing their skill in the requisite designs; and, last, dealers in bullion will no longer be allowed to refine their gold at the public cost, for all the metal sent in in future 'must not exceed the standard weight.' Thus, a most important reform is accomplished—one that will give general satisfaction, stimulate talent, and save L.11,000 a year to the country, when the L.8000 now paid as pensions reverts to the Treasury.

The Post-office is helping on the work of intercommunication with praiseworthy diligence. Think of now being able to send a pound of 'books, maps, or prints, and any quantity of paper, vellum, or parchment,

either printed, written, or plain, or any mixture of the three'—for sixpence, to any part of the United Kingdom! There are many branches of business that will be materially improved by this regulation; and we may hope to see it followed by others not less in accordance with the advancing requirements of the age.

The Nineveh sculptures are now being arranged in the British Museum; one of them weighs fifteen tons, and is an extraordinary specimen of Assyrian art. When in their places, they will be much studied; and, fortunately, more time is to be allowed for this purpose, for the authorities of the Museum have announced, that they will open the doors at nine in the morning, and keep them open till six in the evening, during the best part of the summer. The fate of the Crystal Palace is for the moment a pressing subject of talk. Perhaps the French would buy it, if it be really condemned, for they are already talking of a Great Exposition to be held in 1854, and have come to the conclusion, that twenty-seven months will not be too long to make the preparations: it is expected that all nations will be invited to join. There is to be an exhibition this year also at Breslau, in a building composed in good part of glass, at which Prussia will make a display of her handiwork, and try to get customers for the articles carried home unsold from our spectacle. In more ways than one, the beneficial consequences of the Exhibition of 1851 are shewing themselves. To take but one particular—it has produced a vast amount of literature, and will yet produce more.

Before this appears in print, the new arctic expedition will probably have sailed, to make what we must consider as the final search for Sir John Franklin. This time, Sir Edward Belcher is commander, who, though a rigid disciplinarian, and something beyond, is well known as a most energetic and persevering officer. He is to explore that portion of Wellington Channel discovered by Captain Penny, and to get as far to the north-west as possible—to Behring's Strait, if he can. Whatever else may happen, there are few who will not hope that the mystery respecting the missing explorers, who sailed on their fatal voyage in 1845, may now be cleared up. In order to facilitate Captain Beaton's operations, the Emperor Nicholas has sent instructions to the governors of the Russian trading-ports on the arctic coast, to lend such aid as may be in their power. Thus, good-will is not lacking; indeed, if that could have found the lost adventurers, they would have been discovered long ago.

Some of our engineers and naval men are greatly interested in a subject which has, from time to time, during many years, met with a passing notice—namely, the gradual growth of the banks and shoals in the North Sea from the solid matters carried into it by the rivers of England and Holland. Although slow, the increase is said to be such as to lead to the inference, that this sea will be filled up at some future day. A large chart has just been published, with contour lines of the various banks, to illustrate a treatise on the subject. If these be correct, we have at once valuable data by which to test the question of increase of magnitude. The matter will shortly be discussed by one of our scientific societies. Meantime, the reclamation of a new county from the sea is going on on the Lincolnshire coast; and there appears to be a prospect of a similar work being undertaken on the western shore—at Liverpool. Mr G. Rennie has prepared a plan for a breakwater five miles long, to be constructed at the mouth of the Mersey, stretching out from Black Rock Point. If carried into execution, it will reclaim a vast extent of sandbanks lying within it, and greatly improve the navigable channel of the river. A proposal has been made to apply sewage manure to the reclaimed land, in such ways as will constitute a satisfactory trial of this means of fertilisation; and also to reserve suitable portions as sites for building societies. Such

a project as this would be worthy of the enterprise of Liverpool; but it would be well for the promoters to bear in mind a fact which has lately been urged, that by encroaching on the space of an estuary, you prevent the inflow of the tide, and consequently diminish or weaken the outflow, whereby the whole harbour becomes shallower, and the bar at the mouth augments in bulk.

Although there is nothing extraordinary to talk about in the way of scientific discovery at present, workers in science are not idle, and are steadily pursuing their investigations. Faraday has added another chapter to his 'Experimental Researches in Electricity;' Mr Grove has contributed somewhat to our knowledge of the 'Polarity of Gases;' a paper by Mr Wharton Jones, entitled 'Discovery that the Veins of the Bat's Wing (which are furnished with Valves) are endowed with Rhythmical Contractility, and that the Onward Flow of Blood is accelerated by each Contraction,' is considered to be decisive of a question of some importance in physiology—namely, that the circulation of the blood in the wings is independent of the motion of the heart. Mr Huxley's paper in the Philosophical Transactions is also a remarkable one—one of those which really constitute progress. Although it is not easy to give a popular exposition of it, I may tell you that it discusses the subject of 'alternate generation;' a favourite one, as you will remember, with several naturalists, according to whom, certain of the *Medusæ* are of one sex at one period of their lives, and of the other sex at another. But Mr Huxley shews, by observation and experiment on *Salpa* and *Pyrosoma*, that each has independent powers of reproduction, and his facts are conclusive against the theory of 'alternation of generations.' The two generations, as now appears, are not of distinct individuals, but are both required to make a complete individual. This paper will be sure to provoke criticism, and perhaps excite further research. Mr Hopkins has been enlightening the Geological Society 'On the Causes of the Changes of Climate at Different Geological Periods;' and assigns as one of the causes, the flowing of the gulf-stream in a different direction formerly to that which it follows at present, whereby the northern ice was brought down in great masses to form our glacial period.

Some of our *savans* are interested in Professor Simpson's communication to your Edinburgh Botanical Society, concerning his experiments on Alpine plants kept covered with snow by artificial means in an ice-house for several months. He finds that plants and seeds so treated sprout and germinate rapidly when exposed to the warm air of spring and summer. It appears also that chrysalises similarly treated become moths in about one-tenth of the time required under ordinary circumstances; from which facts, and the celerity of vegetation in Canada and the arctic regions, Professor Simpson infers that, if we in this country were to keep our grain in ice-houses during the winter, we should get quicker and better crops, and avoid the ill consequences which sometimes attend sowing in autumn, or too early in spring. The subject is novel as well as interesting, to say nothing of its bearing on agriculture, and we shall be glad to see the promised results of further inquiry.

There are one or two other Scottish matters which may be mentioned. One is the discovery by Dr Penny of Glasgow, of potash salts in considerable quantity in the soot from blast-furnaces. In our iron districts, and among our iron merchants, it is undergoing that sort of discussion which savours of profit. Potash salts are so valuable, that if the discovery can be reduced to economical practice, there is no doubt that the hitherto wasted and unrecognised substance will be turned to good account. The other is the 'Platometer,' invented by Mr Sang of Kirkcaldy, described as a 'self-acting calculator of surface;' in other words, by using this contrivance, you may get the 'square measure included within any boundary-line around which a pen attached

to the instrument may be carried'—in the plan of an estate, or a map, for example, where the plots of ground are often extremely irregular in form, and difficult to measure, without much complicated calculation. When Arthur Young wished to ascertain the relative proportions of cultivated and uncultivated land in France, he cut up a map of the country, and weighed them one against the other; but the platometer would have helped him to a more satisfactory conclusion. The mode by which it effects its purpose is very simple, 'the essential parts being merely two axles, one of them carrying a cone, by which the computations are silently performed as the pen proceeds on its journey; and the other a small wheel, having numbers on it which tell the result in square measure.' The contents are given with considerable rapidity, and, it is said, with more exactitude than by any other process: the instrument, therefore, is practically useful as well as curious.

Among matters connected with the Académie, Prince Demidoff has asked for instructions as to how he may best serve the cause of science during a journey which he proposes to undertake into Siberia, accompanied by a scientific staff. The prince, who is proprietor of the richest malachite mines in Russia, has already made similar explorations in other parts of Europe, and published the results at his own cost, superbly illustrated, and has presented copies of the works to most of the scientific societies. He could not have better advisers for the purpose contemplated, than he will find among those to whom he has applied. Then a M. Rochas informs the Académie, that a photographic image on a metal-plate, transferred immediately to albumenised glass, may be reproduced and multiplied on paper in any number. Daguerreotypes of waves beating on the sea-shore have been exhibited, which were taken on glass thus prepared in a very minute fraction of a second. Add to this, a plan for a double line of submarine railway from Calais to Dover; a statement from M. Gaietta, that the aurora borealis is nothing more than spontaneously inflamed carburet of hydrogen; and a report from a learned anatomist, on the use, instead of the knife in amputation, of a platinum wire heated red-hot by a battery—and you may form a notion of the variety of communications that comes before the French *savans*. M. Peligot furnishes some details respecting silk-worms. He shews that in every 100 parts of mulberry leaves, as supplied, the result is from 8 to 9 of worms, 36 to 40 of egeated matters, and 45 to 46 of dry litter and waste. That the sixth part only of what the worms consume tends to their nourishment, the remainder goes in respiration and dejection; and that, with the data now obtained, it is possible to calculate the maximum weight of cocoons from a given weight of leaves—it being from 60 to 70 in 1000. He shews further, that in years when leaves are scarce, the loss to the proprietors need not be total, for it is possible to keep the worms on short allowance, and collect their produce, though not so largely as when no privation exists. And what is singular, that the weight of silk is not in proportion to the weight of the worm or moth; heavy and light cocoons contain the same quantity of silk, the difference arises only from the different weight of the worms. Hence M. Peligot considers, that it would be well to destroy the females when first hatched—of course with a reserve for breeding—and keep only the males, which eat less, and give an equal quantity of silk. But as yet the sexes cannot be distinguished, while in the worm state.

You are aware that one of the most interesting geological problems of our day is, that of the rise and fall of the land in Sweden: a good deal has been said on both sides. The Academy of Sciences at Stockholm has, however, taken measures to settle the question. It has chosen sixteen stations, chiefly between Haparanda and Strömstad, where daily observations

are made and recorded on the height of the sea. This is the great point to be determined; hitherto, it has been left too much to chance, or to the attention of casual travellers. In connection with it, the rate of elevation would be ascertained, whether it is everywhere the same, and continuous or intermittent. It has been stated, that at Stockholm the rise was four feet in 100 years, and greater still in the Gulf of Bothnia; but Mr Erdmann of Stockholm, in a memoir on the subject, shews reason to doubt the fact. The house in which he resides, standing near the port, was built at the beginning of the seventeenth century; when the water of the adjacent sea is raised two feet above the ordinary level, which happens but rarely, his cellar is always flooded. Therefore, assuming the rise of the land at four feet in the century, it follows, with only half that height, that when the house was built, the floor of the cellar was constantly under water, which is hardly likely to have been the case. He mentions also the observations made at the sluices of the Mælar Lake, from which a rise of one foot in a century had been inferred, but states that a defect in the measuring-scale completely invalidates the results. In addition to what the Academy are doing, he has had a reference-mark cut on the face of the steep rock of the citadel, so that, in the course of a few years, we shall be in a position to judge in how far the theory of elevation and subsidence of land in Sweden is borne out by the facts.

This reminds one that coral-reefs have been much talked about of late: the opinion is, that they grow in height about an inch and a quarter yearly. Means have also been taken to decide this question. When the American Exploring Expedition lay at Tahiti, Captain Wilkes had a stone-slab fixed on Point Venus, and the distance from it to the Dolphin Shoal below carefully ascertained, so that future measurements will test the theory.

Mr Wells, of Cambridge, Massachusetts, shews that there are causes, besides those usually assigned, which will produce stratification, or those interruptions which occur in deposits. He was engaged in examination of soils; and washed earth through a filter, at times so slowly as to occupy fourteen days in the process, and dried the sediment at a temperature of 250 degrees. This, when dry, he found to be perfectly stratified in divisional planes; sometimes accordant, at others irregular, and shewing difference of material—namely, silica and alumina.

'The strata so produced,' he says, 'were in some instances exceedingly perfect and beautiful, not altogether horizontal, but slightly curved, and in some degree conforming to the shape of the funnel. The production of laminae was also noticed, especially by the cleavage of the strata produced into thin, delicate, parallel plates, when moistened with water. These arrangements, it is evident, were not caused by any interruption or renewal of the matter deposited, or by any change in the quality of the particles deposited, but from two other causes entirely distinct, and which I conceive to be these—first, from a tendency in earthy matter, subjected to the filtering, soaking, and washing of water for a considerable period, to arrange itself according to its degree of fineness, or, perhaps, according to the specific gravity of the particles, and thus form strata; and, secondly, from a tendency in earthy matter, consolidated both by water and subsequent exsiccation, to divide, independently of the fineness or quality of its component particles, into strata or laminae.'

Whether Mr Wells be right in his conclusions, remains to be proved; geologists will not fail to examine into his proofs. They may, however, remember, that Agassiz has remarked, that saw-dust through which water has been filtered, will 'assume a regular stratified appearance;' and that, in beds of clay and clay-slate, the deposits are such as to justify these conclusions.

The *Felix Meritis* Society at Amsterdam propose to give their gold medal, or twenty gold ducats (L.10), for the best answer to the questions—'What are the re-agents the most proper to demonstrate, in a sure and easy way, the presence of ozone, and to determine its quantity? Does ozone always exist in the atmosphere, and under what circumstances, regard being had to the seasons and hour of the day, is it found to increase or diminish? From what properties can it be inferred that ozone is favourable or hurtful to the animal economy, and what has experiment made known in this respect, particularly in the appearance or disappearance of epidemic diseases?'

The treatises to be distinguished by a device, not by the author's signature: they may be written in English, French, Dutch, or German, and are to be sent addressed—*Felix Meritis*, Amsterdam, before May 1, 1858. The Society reserve to themselves the right of publishing the successful paper at their own cost.

SONNET:

ON OVERHEARING A LITTLE CHILD (A VISITOR) SAYING
'MAMMA' IN THE NEXT ROOM.

HARK! through the wall it comes! and to my ear
It sounds the sweetest of all silvery tones,
So soft, yet syllabled distinct and clear,
'Mamma!'—and happy she the name who owns!
Nor would I all suppress this starting tear,
Which blinds me, while that infant's voice I hear!
Say it again, fair child; I like it well,
Although I sit alone, within my room,
Like hermit-hearted man within his cell.
It wakens Reminiscence, like a bell;
And summons up a vanished Form most dear,
Which, long years since, I laid within the tomb!
Strange, that a simple sound should reach so deep,
And flood my heart with thoughts, and make me weep!

Just Published, Price 6d. Paper Cover,
CHAMBERS'S POCKET MISCELLANY: forming a LITERARY
COMPANION for the RAILWAY, the FIRE-SIDE, or the BUSH.

VOLUME V.

To be continued in Monthly Volumes.

Bound in Leather,

A SCHOOL DICTIONARY OF THE GERMAN LANGUAGE.
In Two Parts. By Dr J. H. KALTSCHMIDT.—Forming one of the
volumes of the GERMAN SECTION of CHAMBERS'S EDUCATIONAL
COURSE.

PART I.—GERMAN-ENGLISH, now ready.

This Dictionary has been compiled from the latest editions of Flügel, Hilpert, and Grieb, expressly for the assistance of English students of German. As it has been the chief object of the Author to unite comprehensiveness with brevity, a much larger number of scientific and technical terms, as well as geographical and other proper names, have been introduced, than are found in any other Dictionary of the same compass; while the whole has been cleared of redundant explanation and improper expressions, and carefully revised by an English Scholar acquainted with German.

Cloth, Lettered,

POLITICAL ECONOMY, for use in SCHOOLS, and for PRIVATE
INSTRUCTION.—Forming one of the volumes of CHAMBERS'S
EDUCATIONAL COURSE.

In this Treatise, that hitherto neglected branch of study, Social Economy, is presented to the pupil in simple language; and by commencing with subjects of moral and social concern, the principles of Political Economy are gradually and naturally developed, and may be mastered without difficulty.

Printed and Published by W. and R. CHAMBERS, High Street, Edinburgh. Also sold by W. S. ORR, Amen Corner, London; D. N. CHAMBERS, 55 West Nile Street, Glasgow; and J. McGLASSAR, 50 Upper Sackville Street, Dublin.—Advertisements for Monthly Parts are requested to be sent to MAXWELL & Co., 31 Nicholas Lane, Lombard Street, London, to whom all applications respecting their insertion must be made.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 435. NEW SERIES.

SATURDAY, MAY 1, 1852.

PRICE 1½d.

FORCED BENEFITS.

THE maxim, that men may safely be left to seek their own interest, and are sure to find it, appears to require some slight qualification, for nothing can be more certain, than that men are often the better of things which have been forced upon them. Those who advocate the idea in its rigour, forget that there are such things as ignorance and prejudice in the world, and that most men only become or continue actively industrious under the pressure of necessity. The vast advantages derived from railway communication afford a ready instance of people being benefitted against their will. At the bare proposal to run a line through their lands, many proprietors were thrown into a frenzy of antagonism; and whole towns petitioned that they might not be contaminated with the odious thing. In spite of remonstrances, and at a vast cost, railways were made; and we should like to know where opponents are now to be found. Demented land-proprietors are come to their senses; and even recalcitrant Oxford is glad of a line to itself.

Cases of this kind suggest the curious consideration, that many remarkable benefits now experienced were never sought for or contemplated by the persons enjoying them, but came from another quarter, and were at first only grudgingly submitted to. A singular example happens to call our attention. There is a distillery in the west of Scotland, where it has been found convenient to establish a dairy upon a large scale, for the purpose of consuming the refuse of the grain. Seven hundred cows are kept there; and a profitable market is found for their milk in the city of Glasgow. That the refuse of the cow-houses might be applied to a profitable purpose, a large farm was added to the concern, though of such land as an amateur agriculturist would never have selected for his experiments. Thus there was a complete system of economy at this distillery: a dairy to convert the draff into milk, and a farm to insure that the soil from the cows might be used upon the spot. But, as is so generally seen in this country, the liquid part of the refuse from the cow-houses was neglected. It was allowed to run into a neighbouring canal; and the proprietors would have been contented to see it so disposed of for ever, if that could have been permitted. It was found, however, to be a nuisance, the very fishes being poisoned by it. The proprietors of the canal threatened an action for the protection of their property, and the conductors of the dairy were forced to bethink them of some plan by which they should be enabled to dispose of the noxious matter without injury to their neighbours. They could at first hit upon no other than that of carting away the liquid

to the fields, and there spreading it out as manure. No doubt, they expected some benefit from this procedure; and, had they expected much, they might never have given the canal company any trouble. But the fact is, they expected so little benefit, that they would never have willingly taken the trouble of employing their carts for any such purpose. To their surprise, the benefit was such as to make their lean land superior in productiveness to any in the country. They were speedily encouraged to make arrangements at some expense for allowing the manure in a diluted form to flow by a regular system of irrigation over their fields. The original production has thus been *increased fourfold*. The company, finding no other manure necessary, now dispose of the solid kind arising from the dairy, among the neighbouring farmers, who still follow the old arrangements in the management of their cows. The sum of L.600 is thus yearly gained by the company, being not much less than the rent of the farm. If to this we add the value of the extra produce arising from the land, we shall have some idea of the advantage derived by this company from having been put under a little compulsion.

An instance, perhaps even more striking, was supplied a few years ago by certain chemical works which vented fumes noxious to a whole neighbourhood. Being prosecuted for the nuisance, the proprietors were forced to make flues of great length, through which the fumes might be conducted to a considerable distance. The consequence was surprising. A new kind of deposit was formed in the interior of the flues, and from this a large profit was derived. The sweeping of a chimney would sometimes produce several thousand pounds. At the same time, nothing can be more certain than that this material, but for the threat of prosecution, would have been allowed to continue poisoning the neighbourhood, and, consequently, not yielding one penny to the proprietors of the works.*

It has pleased Providence to order that from all the forms of organic life there shall arise a refuse which is offensive to our senses, and injurious to health, but calculated, under certain circumstances, to prove highly beneficial to us. The offensiveness and noxiousness look very much like a direct command from the Author of Nature, to do that which shall turn the refuse to a good account—namely, to bury it in the earth. Yet, from sloth and negligence, it is often allowed to cumber the surface, and there do its evil work instead. An

* The idea of this article, and the above facts, are derived from a valuable memoir just published by the Board of Health, with reference to the practical application of sewage water and town manures to agricultural production.

important principle is thus instanced—the essential identity of Nuisance and Waste. Nearly all the physical annoyances we are subjected to, and nearly all the influences that are operating actively for our hurt, are simply the exponents of some chemical solecism, which we are, through ignorance or indifference, committing or permitting. There is here a double evil—a positive and a negative. When the Londoner groans at the smokiness of his streets, and the particles of soot he finds spread over his shirt, his toilet-table, and every nice article of furniture he possesses, he has the additional vexation of knowing, that the smoke and soot should have been serving a useful purpose as fuel. When he passes by a railway over the tops of the houses in some mean suburb, and looks down with horror and disgust on the pools and heaps of filth which are allowed to encumber the yards, courts, and narrow streets of these localities, to the destruction of the health of the inhabitants, he has a second consideration before him, that all these matters ought to be in the care of some easy-acting system, by which, removed to the fields, they should be helping to create the means of life, instead of death. We never can look upon a great factory chimney pouring forth its thick column of smoke, without a twin grief—for the disgust it creates, and the good that is lost by it. Properly, that volatile fuel should be doing duty in the furnace, and effecting a saving to the manufacturer, instead of rendering him and his concerns a nuisance to all within five miles.

Troublesome as these nuisances are, there is such an inaptitude to new plans, that they might go on for ever, if an interference should not come in from some external quarter. It matters little whence the interference comes, so that the end be effected. We cannot, however, view the proceedings of a Board of Health in ordering cleanly arrangements, or those of a municipal council putting down factory smoke, without great interest, for we think we there see part, and an important one too, of the great battle of Civilisation against Barbarism. And this interest is deepened when we observe the benefits which Barbarism usually derives from its own defeats. The factory-owner, for instance, will find that, in applying an apparatus by which smoke may be prevented, he will not merely be sparing his neighbours a great annoyance, but economising fuel to an extent which must more than repay the outlay. By repressing nuisance, he will be in the same measure repressing waste.* Were there, in like manner, a general measure for enforcing the removal of refuse from the neighbourhood of human habitations, the rate-payers would in due time see blessed effects from the compulsion to which they had been subjected. Their groans would be succeeded by gladness, and they would thank the legislators who had slighted their remonstrances. When the cholera approached in 1849, our British Board of Health ordered a general cleaning out of stables, and a daily persistence in the practice. It was complained of as a great hardship; but the Board ascertained that owners of valuable race-horses cause their stables to be thoroughly cleaned daily, as a practice necessary for the health of the animals; the Board, therefore, very properly insisted on forcing this benefit upon the proprietors of horses generally. Can we doubt that a similar policy might be followed with the like good consequences at all times, and with regard to the habitations of men as well as horses?

It would thus appear, that men may really be allowed a too undisturbed repose in their views and maxims, and, if always left to seek their own interests,

would often fail to find the way. If, indeed, it were true that men are sure to find out their own interest, no country should be behind another in any of the processes or arts necessary for the sustenance and comfort of the people; whereas we know the contrary to be the case. If it were true, there should be no class in our own country willing to sit down with the dubious benefits of monopoly, instead of pushing on for the certain results of enlightened competition. It could only be true at the expense of the old proverb, that necessity is the mother of invention; for do we not every day see men submitting idly and languidly to evils which can just be borne? whereas, if these were a little greater, and therefore insupportable, they would at once be remedied. An impulse *ab extra* seems in a vast number of instances to be necessary, to promote the good of both nations and individuals. Now, whether this shall come in the ordinary course of things, and be recognised as necessity, or from an enlightened power having a certain end, generally beneficial, in view, does not appear to be of much consequence, provided only we can be tolerably well assured against the abuses to which all power is liable. It may be well worthy of consideration, whether, in this country, we have not carried the principle of *Laissez faire*, or *leave us alone*, a little too far in certain matters, where some gentle coercion would have been more likely to benefit all concerned.

MONSIEUR JEROME AND THE RUSSIAN PRINCESS.

ON arriving at Blois, I went to the Hôtel de la Tête Noire—a massive, respectable-looking building, situated on the quay nearly opposite a bridge that crosses the river to the suburb of St Etienne. The comfort of the rooms, and the excellence of the dinners that succeeded one another day by day, induced me to stay longer than I had intended, and rendered me spectator and part-actor in an adventure not uncommon in French-land. My apartment was numbered 48—by the way, who ever saw No. 1 in a hotel, or upon a watch?—and next door—that is, at No. 49—dwelt a very dignified-looking gentleman, always addressed as M. Jerome. I often take occasion to say, that I pique myself on being something of a physiognomist; and as I have been several times right in my judgment of character and position from inspection of the countenance, the occasions in which I have been mistaken may be set down as exceptions. M. Jerome at once interested me; and as I was idly in search of health, and had taken care to have nothing whatever to do but to kill time, the observation of this gentleman's appearance and manners naturally formed a chief part of my occupation.

I began by ascertaining exactly the colour of his eyes and hair—nearly black; the shape of his nose—straight, and rather too long; and would have been glad to examine the form of his mouth, but a huge moustache hanging over his lips in the French military style—see the portrait of General Cavaignac—prevented me from ascertaining the precise contour of what one of my old philosophers calls the Port Equiline of Derision. M. Jerome was, upon the whole, a handsome man, with a romantically bilious complexion; and the expression of his large dark eyes was really profound and striking. His costume was always fashionable, without being showy; and there was nothing to object to but a diamond ring, somewhat too ostentatiously displayed on the little finger, which, in all his manual operations, at dinner or elsewhere, always cocked up with an impertinent 'look-at-me air,' that I did not like. When, indeed, this dandy walked slowly out of the dining-room to the door-step, and lighted his cigar, the said little finger became positively obnoxious; and I used to think whether it were

* We understand that this has been the case with factory-owners at Manchester who have applied the smoke-preventing apparatus. The saving from such an apparatus in the office where this sheet is printed, appears to be about 5 per cent.; an ample equivalent for the outlay.

possible that that human being had been created purposely as a scaffolding whereon to exhibit a flashing little stone, set in twenty shillings worth of gold.

M. Jerome, though not, strictly speaking, a silent man, was sufficiently reserved at table. The early courses were by him always allowed to pass without any further remark than what politeness requires—as: 'Shall I send you some more of this *blanquette*?' or, 'With pleasure, sir;' and so forth. When dessert-time approached, however, he generally began to unbend, to take part in the general conversation, and throw in here and there a piquant anecdote. He did this with so much grace, that had it not been for the diamond ring, I should have been disposed to consider him as a man of large experience in the best society. The other people who generally attended at table—travellers, commercial and otherwise, with one or two smart folks from the town, on the look-out for Parisian gossip, to retail to the less adventurous members of their circle—were all delighted with M. Jerome: it was M. Jerome here, and M. Jerome there; and if M. Jerome happened to dine out, every one seemed to feel uneasy, and look upon him as guilty of a great dereliction of duty. They could almost as well have done without their *demi-tasse*.

Although I am an inquisitive, I am not a very impertinent man. I like to pry into other people's affairs only in so far as I can do so without hurting their feelings, or putting my own self-love in danger of a check. If, therefore, I gave the reins to my curiosity, and devoted myself to studying the more apparent movements of this M. Jerome, I shrank from putting any direct questions to the *garçon*, who might probably at once have given me a very prosaic account of him. On one occasion, I threw in casually a remark, to the effect that the gentleman at No. 49 seemed a great favourite with the fair sex; but the only reply was a smile, and an acknowledgment that, in general, people of fascinating exterior—here the *garçon* glanced at the mirror he was dusting—were great favourites with the fairer portion of the creation. 'We Frenchmen,' it was added, 'know the way to the female heart better than most men.' The waiter had paused with his duster in his hand. I felt that he was going to give me his Art of Love; and opportunely remembering that I had a letter to put into the post, I escaped the infliction for the time.

I had, indeed, observed that if the public generally admitted the valuable qualities of M. Jerome as a companion, his reputation was based principally on the approval of the ladies. All these excellent judges agreed that he was a nice, quiet, agreeable person; and 'so handsome!' At least the seven members of an English family, who had come to visit Chambord, and lingered at the hotel a week—five of them were daughters—all expressed this opinion of M. Jerome; and even a supercilious French lady, with a particle attached to her name, admitted that he was 'very well.'

One day, a new face appeared at table to interest me; and as the mysterious gentleman and his diamond ring had puzzled me for a fortnight, during which I had made no progress towards ascertaining his real position and character, I was not sorry to have my attention a little diverted by a mysterious lady. Madame de Mourairef—a Russian name, thought I—was a very agreeable person to look at; much more so to me than M. Jerome. She was not much past twenty years of age; small, slight, elegant in shape, if not completely so in manners; and with one of those charming little faces which you can analyse into ugliness, but which in their synthesis, to speak as moderns should, are admirable, adorable, fascinating. I should have thought that such a *minois* could belong only to Paris—the city, by the way, of ugly women, whom art makes charming. However, there

it was above the shoulders, high of course—swannecked women are only found in England—above the shoulders of a Russian marchioness, princess, czarina, or what you will, who called for her cigarettes after dinner, was attended by a little *soubrette*, named Penelope, and looked for all the world as if she had just been whirled off the boards of the Opera Comique.

I at first believed that this was a mere *masquerade*; but when a letter in a formidable envelope, with the seal of the Russian embassy, arrived, and was exhibited in the absence of the lady herself, to every one of the lodgers, in proof of the aristocratic character of the customer of the Tête Noire, I began to doubt my own perspicacity, and to imagine that I had now a far more interesting object of study than M. Jerome and his diamond ring. Madame de Mourairef was an exceedingly affable person; and the English family aforesaid, whom I have reason to believe were Cockney tradesfolks, pronounced her to be very high-bred—without a fault, indeed, if it had not been for that horrid habit of smoking, which, as they judiciously observed, however, was a peculiar characteristic of the Russians. I am afraid, they would have set her down as a vulgar wretch, had they not been forewarned that she was aristocratic. The French lady seemed to look upon the foreign one as an intruder, and scarcely deigned to turn her eyes in that direction. Probably this was because she was so charming, and monopolised so much of the attention of us gentlemen.

'They no sooner looked than they loved,' says Rosalind. This was not, perhaps, quite the case with M. Jerome and the Russian princess, who took care to let it be known that she was a widow; but in a very few days what is called 'a secret sympathy' evidently sprang into existence. The former, of course, made the first advances. His diplomatic and seductive arts were not, however, put to a great test, for in three days the lady manifestly felt uneasy until he presented himself at dinner; and in a week, I met them walking arm in arm on the bridge. It was easy to see that he was on his good behaviour; and from some fragments of conversations I overheard between them when they met in the passage opposite my door, I learned that he was 'doing the melancholy dodge,' as in the vernacular we would express it; and had many harrowing revelations to make as to the manner in which his heart had been trifled with by unfeeling beauties.

'There is a tide in the affairs of an hôtel!' I am in a mood for quoting from my favourite authors; and whereas we had at one time sat down nearly twenty to table, we suddenly found ourselves to be only three—M. Jerome, the princess, and myself. A kind of intimacy was the natural result. We made ourselves mutually agreeable; and I was not at all surprised, when one evening Madame de Mourairef invited us two gentlemen to take tea with her in her little sitting-room. Both accepted joyfully; and though I am persuaded that M. Jerome would have preferred a tête-à-tête, he accepted my companionship with tolerable grace. We strolled together, indeed, on the quay for half an hour. It was raining slightly, and I had a cough; but I have too good an opinion of human nature to imagine that my new acquaintance kept me out by his fascinating conversation, in order to make me catch a desperate cold, that would send me wheezing to bed.

The tea was served, as I suppose it is served in Russia, very weak, with a plentiful admixture of milk and accompaniment of *biscuits glacés*. Madame de Mourairef did the honours in an inexpressibly graceful manner; and I observed that there was a delightful intimacy between her and her maid Penelope, that quite upset my ideas of northern serfdom. I think they even once exchanged a wink, but of this I am not sure. There is nothing like experience to expand one's ideas, and I made up my mind to re-examine the whole

of my notions of Muscovite vassalage. M. Jerome seemed less struck by these circumstances than myself—being probably too much absorbed in contemplation of our hostess—but even he could not avoid exclaiming, 'that if that were the way in which serfs were treated, he should like to be a serf—of such a mistress!'

'You Frenchmen are so gallant!' was the reply.

A little while afterwards, somebody proposed a game of whist. There was an objection to 'dead-man,' and Penelope, with a semi-oriental salaam, offered to 'take a hand.' Madame de Mourairef was graciously pleased to order her to do so. We shuffled, cut, and played; and when midnight came, and it was necessary to retire, I felt almost afraid to examine into my own heart, lest I might find that the soubrette appeared to me at least as high-bred as the mistress.

We spent some delightful evenings in this manner, and perhaps still more delightful days, for by degrees we became inseparable, and all our walks and drives were made in common. The garçon often looked maliciously at me, even offered once or twice to develop his Art of Love; but I did not choose to be interrupted in my physiognomical studies, and gave him no opportunity.

A picnic was proposed, and agreed upon. We intended at first to go to Chambord; but there was danger of a crowd; and a valley on the road to Vendôme was pitched upon. A *calèche* took us to the place, and set us down in a delightful meadow, enamelled with flowers, as all meadows are in poetry. A few great trees, forming almost a grove, shaded a slope near the banks of a sluggish stream that crept along between an avenue of poplars. Here the cloth was laid at once for breakfast; and whilst M. Jerome and the princess strolled away to talk of blighted hopes, Russia, serfdom, wedlock, and the conflagration of the Kremlin, Penelope made the necessary preparation; and I, in my character of a fidgety old gentleman, first advised and then assisted her. I am afraid the young damsel had designs upon my heart, for she put several questions to me on the state of vassalage in England; and when I developed succinctly the principles and advantages of our free constitution, and said some eloquent things that formed a French edition of 'Britons never shall be slaves,' she became quite enthusiastic; her cheeks flushed, her eyes brightened; and with a sort of Theriogne-de-Mericourt gesture, she cried: 'Vive la République!' This was scarcely the natural product of what I had said; but so lively a little creature, in her dainty lace-cap and flying pink ribbons, neat silk *caraco*, plaid-patterned gown, with pagoda sleeves, as she called them, and milk-white *manchettes*—her *bottines* from the Rue Vivienne, and her face from Paradise—could reconcile many a harder heart than mine to greater incongruities. Our arrangements being made, therefore, I sat down on a camp-stool, whilst Penelope reclined on the grass; and I endeavoured to explain to her the great advantages of a moderate constitutional government, with checks, balances, and so forth. Although she yawned, I am sure it was not from ennui, but in order to shew me her pretty pearly teeth.

M. Jerome and the princess came streaming back over the meadow—even affected to scold me for having remained behind. They were evidently on the best possible terms, and I took great satisfaction in contemplating their happiness. Either my perspicacity was at fault, however, or both had some secret cause of uneasiness that pressed upon their minds as the day advanced. Had they been only betrayed into a declaration and a plighting of their troth in a hurry? Did they already repent? Did Madame de Mourairef regret the barbarous splendour of her native land? Did M. Jerome begin to modern over the delights of bachelorship? These were the questions I put to myself without being able to invent any satisfactory answer. The day passed,

however, pleasantly enough; and the *calèche* came in due time to take us back to Blois.

Next morning, M. Jerome entered my room with a graceful bow, to announce his departure for Paris, whither it was necessary for him to go to obtain the necessary papers for his marriage, and Madame de Mourairef, he added, accompanied him. I uttered the necessary congratulations, and gave my address in Paris, that he might call upon me as soon as he was settled in the hôtel he proposed to take.

'I take two persons with me,' he said, smiling; 'but one of them leaves her heart behind, I am afraid.'

This alluded to Penelope; but I was determined not to understand. I went to say adieu to Madame de Mourairef, who seemed rather excited and anxious. Penelope almost succeeded in wringing forth a tear; but I did not think it was decreed that at my age I should really make love to a Russian serf, however charming. So off they went to the railway station, leaving me in a very dull, stupid, melancholy mood.

'What a fortunate man M. Jerome is!' said the garçon, as he came into my room a few minutes afterwards.

'Yes,' I replied; 'Madame de Mourairef seems in every way worthy of him.'

'I should think so,' quoth he. 'It is not every waiter, however fascinating, that falls in with a Russian princess.'

'Waiter! M. Jerome!'

'Of course,' replied my informant. 'You seem surprised; but M. Jerome is really a waiter at the Café —, on the Boulevard des Italiens; came down for his health. We were comrades once, and I promised to keep the secret, for he thought it extremely probable that he might meet a wealthy English lady here, who might fall in love with him—your countrywomen are so eccentric. He has found a Russian princess, which is better. I suppose we must now call him Monseigneur?'

Although, like the rest of my species, disposed to laugh at the misfortunes of my fellow-creatures, I confess that I pitied Madame de Mourairef; for I felt persuaded that M. Jerome had passed himself off as a very distinguished personage. However, there was no remedy, and I had no right to interfere in the matter. The lady, indeed, had been in an unpardonable hurry to be won, and must take the consequences.

In the afternoon, there was a great bustle in the hôtel, and half-a-dozen voices were heard doing the work of fifty. I went out into the passage, and caught the first fragments of an explanation that soon became complete. M. Alphonse, courier to M. de Mourairef, had arrived, and was indignantly maintaining that Sophie and Penelope, the two waiting-maids of the princess, had arrived at the Tête Noire, to take a suite of rooms for their mistress; whilst the landlord and his coadjutors, slow to comprehend, averred that the great lady had herself been there, and departed. The truth at length came out—that these two smart Parisian lasses, having a fortnight before them, had determined to give up their places, and play the masquerade which I have described. When M. and Madame de Mourairef, two respectable, middle-aged people, arrived, they were distastefully made acquainted with the sacrilege that had been committed; but as no debts had been contracted in their name, and their letters came in a parcel by the post from Orleans, they laughed heartily at the joke, and enjoyed the idea that Sophie had been taken in.

The following winter, I went into a café newly established in the Rue Poissonnière, and was agreeably surprised to see Sophie, the pseudo-princess, sitting behind the counter in magnificent toilette, receiving the bows and the money of the customers as they passed before her, whilst M. Jerome—exactly in appearance as before, except that prosperity had begun

to round him—was leaning against a pillar in rather a melodramatic attitude, a white napkin gracefully depending from his hand. They started on seeing me, and were a little confused, but soon laughed over their adventure; called Penelope to take her turn at the counter—the little serf whispered to me as she passed, that I was 'a traitor, a barbarian,' and insisted on treating me to my coffee and my *petit verre*, free, gratis, for nothing.

MEMOIRS OF LORD JEFFREY.

Is the crisis of the French Revolution, British society was paralysed with conservative alarms, and all tendency to liberal opinions, or even to an advocacy of the most simple and needful reforms, was met with a ruthless intolerance. In Scotland, there was not a public meeting for five-and-twenty years. In that night of unreflecting Toryism, a small band of men, chiefly connected with the law in Edinburgh, stood out in a profession of Whiggism, to the forfeiture of all chance of government patronage, and even of much of the confidence and esteem of society. Three or four young barristers were particularly prominent, all men of uncommon talents. The chief was Francis Jeffrey, who died in 1850, in the seventy-seventh year of his age, after having passed through a most brilliant career as a practising lawyer and judge, and one still more brilliant, as the conductor, for twenty-seven years, of the celebrated *Edinburgh Review*. Another was Henry Cockburn, who has now become the biographer of his great associate. It was verily a remarkable knot of men in many respects, but we think in none more than a heroic probity towards their principles, which were, after all, of no extravagant character, as was testified by their being permitted to triumph harmlessly in 1831-2. These men anticipated by forty years changes which were ultimately patronised by the great majority of the nation. They all thrived professionally, but purely by the force of their talents and high character. As there was not any precisely equivalent group of men at any other bar in the United Kingdom, we think Scotland is entitled to take some credit to herself for her Jeffreys, her Cranstons, her Murrys, and her Cockburns: at least, she will not soon forget their names.

Lord Jeffrey—his judicial designation in advanced life—was of respectable, but not exalted parentage. After a careful education at Edinburgh, Glasgow, and Oxford, he entered at the bar in 1793, when not yet much more than twenty years of age. His father, being himself a Tory, desired the young lawyer to be so too, seeing that it would be favourable to his prospects; but he could not yield in this point to paternal counsel. The consequence was, that this able man practised for ten years without gaining more than £100 per annum. All this time, he cultivated his mind diligently, and was silently training himself for that literary career which he subsequently entered upon. His talents were at that time known only to a few intimates: there were peculiarities about him, which prevented him from being generally appreciated up to his deserts. His figure, to begin with, was almost ludicrously small. Then, in his anxiety to get rid of the Scottish accent, he had contracted an elocution intended to be English, but which struck every one as most affected and offensive. His manners were marked by levity, and his conversation to many seemed flippant. His literary musings also acted unfavourably on the solicitors, the leading patrons of young counsellors. Reduced by dearth of business almost to despair, he had at one time serious thoughts of flinging himself upon the London press for a subsistence. The first smile of fortune beamed upon him in 1802, when the *Edinburgh Review* was started—a work of which he quickly assumed the management. That it brought

him income and literary renown, we gather from Lord Cockburn's pages; but we do not readily find it explained how. While more declaredly a literary man than ever, he now advanced rapidly at the bar, and quickly became a man of wealth and professional dignity. We suspect that, after all that is said of the effect of literary pursuits on business prospects, the one success was a consequence in great measure of the other.

The value of this work rests, in our opinion, on the illustration which it presents of the possibility of a man of sound though unpopular opinions passing through life, not merely without suffering greatly from the wrath of society, but in the enjoyment of some of its highest honours. After reading this book, one could almost suppose it to be a delusion that the world judges hardly of any man's speculative opinions, while his life remains pure, and his heart manifestly is alive to all the social charities. The heroic consistency of Jeffrey is the more remarkable, when it now appears that he was a gentle and rather timid man, keenly alive to the sympathies of friends and neighbours—indeed, of *womanish* character altogether. As is well known, his time arrived at last, when, on the coming of the Whigs into power in 1830, he was raised to the dignified situation of Lord Advocate for Scotland, and was called upon to take the lead, officially, in making those political changes which he had all along advocated. It is curious, however, and somewhat startling, to learn how little gratification he professed to feel in what appeared so great a triumph. While his rivals looked with envy on his exaltation, and mobs deemed it little enough that he should be entirely at their beck in requital for the support they gave him, Mr Jeffrey was sighing for the quiet of private life, groaning at his banishment from a happy country-home, and not a little disturbed by the troubled aspect of public affairs. Mr Macaulay has somewhere remarked on the general mistake as to the 'sweets of office.' We are assured by Lord Cockburn, that Jeffrey would have avoided the advocateship if he could. He accepted it only from a feeling of duty to his party. He writes to a female relation of the 'good reason I have for being sincerely sick and sorry at an elevation for which so many people are envying, and thinking me the luckiest and most elevated of mortals for having attained.' And this subject is still further illustrated by an account he gives of the conduct of honest Lord Althorpe during the short interval in May 1832, when the Whigs were out. 'Lord Althorpe,' he says, 'has gone through all this with his characteristic cheerfulness and courage. The day after the resignation, he spent in a great sale-garden, choosing and buying flowers, and came home with five great packages in his carriage, devoting the evening to studying where they should be planted in his garden at Althorpe, and writing directions and drawing plans for their arrangement. And when they came to summon him to a council on the Duke's giving in, he was found in a closet with a groom, busy oiling the locks of his fowlingpieces, and lamenting the decay into which they had fallen during his ministry.'

In some respects, the book will create surprise, particularly as to the private life and character of the great Aristarch. While the *Edinburgh Review* was in progress under the care of Mr Jeffrey, it was a most unrelenting tribunal for literary culprits, as well as a determined assertor of its own political maxims. The common idea regarding its chief conductor represented him as a man of extraordinary sharpness, alternating between epigrammatic flippancy and democratic rigour. Gentle and refined feeling would certainly never have been attributed to him. It will now be found that he was at all times of his life a man of genial spirit towards the entire circle of his fellow-creatures—that his leading tastes were for poetry and the beautiful in external nature, particularly fine scenery—that he revelled in

the home affections, and was continually saying the softest and kindest things to all about him—a lamb, in short, while thought a lion. The local circle in which he lived was somewhat limited and exclusive, partly, perhaps, in consequence of having been early shut in upon itself by its dissent from the mass of society on most public questions; but in this circle Jeffrey was adored by men, women, and children alike, on account of his extreme kindness of disposition. He was almost, to a ridiculous degree, dependent on the love of his friends; and the terms in which he addresses some of them, particularly ladies, sound odd in this common-sense world. Thus, the wife of one of his friends is, 'My sweet, gentle, and long-suffering Sophia.' He pours out his very heart to his correspondents, and with an effect which would reconcile to him the most irascible author he ever scarified. Thus, to his daughter, who had just left him with her husband:—'I happened to go up stairs, and passing into our room, saw the door open of that little one where you used to sleep, and the very bed waiting there for you, so silent and desolate, that all the love, and the *miss* of you, which fell so sadly on my heart the first night of your desertion, came back upon it so heavily and darkly, that I was obliged to shut myself in, and cry over the recollection, as if all the interval had been annihilated, and that loss and sorrow were still fresh and unsubdued before me; and though the fit went off before long, I feel still that I must vent my heart by telling you of it, and therefore sit down now to write all this to you, and get rid of my feelings, that would otherwise be more likely to haunt my vigils of the night.' Thus, on the death of a sister in his early days:—'A very heavy blow upon us all, and much more so on me than I had believed possible. The habit of seeing her almost every day, and of living together intimately since our infancy, had wound so many threads of affection round my heart, that when they were burst at once, the shock was almost overwhelming. Then, the unequalled gentleness of her disposition, the unaffected worth of her affections, and miraculous simplicity of character and manners, which made her always appear as pure and innocent as an infant, took so firm, though gentle a hold on the heart of every one who approached her, that even those who have been comparatively strangers to her worth, have been greatly affected by her loss. . . . During the whole of her illness, she looked beautiful; and when I gazed upon her the moment after she had breathed her last, as she lay still, still, and calm, with her bright eyes half closed, and her red lips half open, I thought I had never seen a countenance so lovely. A statuery might have taken her for a model. Poor, dear love! I kissed her cold lips, and pressed her cold, wan, lifeless hand, and would willingly at that moment have put off my own life too, and followed her. When I came here, the sun was rising, and the birds were singing gaily, as I sobbed along the empty streets.'

The sensibility of Jeffrey to all fine expression that comes to us through the medium of literature was intense, most so in his latter days, when his whole character seems to have undergone a mellowing process. While pining under his greatness as Lord Advocate, and an authority in parliament (1833), he says: 'If it were not for my love of beautiful nature and poetry, my heart would have died within me long ago. I never felt before what immeasurable benefactors these same poets are to their kind, and how large a measure, both of actual happiness and prevention of misery, they have imparted to the race. I would willingly give up half my fortune, and some little fragments of health and bodily enjoyment that yet remain to me, rather than that Shakespeare should not have lived before me.' Who that had only read his lively, acute articles in the formal Review, could have believed him to be so deeply sympathetic with an unfortunate poet, as he shews in the following fine passage in one of his letters

(1837)? 'In the last week, I have read all Burns's *Life and Works*—not without many tears, for the life especially. What touches me most, is the pitiable poverty in which that gifted being (and his noble-minded father) passed his early days—the painful frugality to which their innocence was doomed, and the thought how small a share of the useless luxuries in which we (such comparatively poor creatures) indulge, would have sufficed to shed joy and cheerfulness in their dwellings, and perhaps to have saved that glorious spirit from the trials and temptations under which he fell so prematurely. Oh! my dear Empson, there must be something *terribly* wrong in the present arrangements of the universe, when those things can happen, and be thought natural. I could lie down in the dirt, and cry and grovel there, I think, for a century, to save such a soul as Burns from the suffering, and the contamination, and the *degradation*, which these same arrangements imposed upon him; and I fancy that, if I could but have known him, in my present state of wealth and influence, I might have saved, and reclaimed, and preserved him, even to the present day. He would not have been so old as my brother-judge, Lord Glenlee, or Lord Lynedoch, or a dozen others that one meets daily in society. And what a creature, not only in genius, but in nobleness of character, potentially at least, if right models had been put *gently* before him!'

The narrative of Lord Cockburn occupies only one volume, the other being filled with a selection from Lord Jeffrey's letters. It is a brief chronicle of the subject; many will feel it to be unsatisfactorily slight. The author seems to have been afraid of becoming tedious. It is, however, a manly and faithful narration, with the rare merit of going little, if at all, beyond bounds in its appreciation of the hero or his associates, or the importance of the circumstances in which he moved. The sketches of some of Jeffrey's contemporaries, as John Clerk, Sir Harry Moncreiff, and Henry Erskine, are vigorous pieces of painting, which will suggest to many a desire that the author should favour the public with a wider view of the men and things of Scotland in the age just past. With a natural partiality as a friend and as a biographer, he seems to us to set too high an estimate on Jeffrey when he ranks him as one of a quartett, including Dugald Stewart, Sir Walter Scott, and Dr Chalmers, 'each of whom in literature, philosophy, or policy, caused great changes,' and 'left upon his age the impression of the mind that produced them.' Few of his countrymen would claim this rank for either Jeffrey or Stewart. Jeffrey, no doubt, raised a department of our literature from a low to a high level; he was a Great Voice in his day. But he produced nothing which can permanently affect us; he gave no great turn to the sentiments or opinions of mankind. His only original effort of any mark, is his exposition of the association theory of beauty, which rests on a simple mistake of what is pleasing for what is beautiful, and is already nothing. We suspect that no man with his degree of timidity will ever be very great, either as a philosopher or as a man of deeds. He was a brilliant *writer*—the most brilliant, and, with one exception, the most versatile in his age; but to this we would limit his panegyric, apart from the glory of his long and consistent career as a politician, which we think can scarcely be overestimated.

So many of the most remarkable passages of the work have been already hackneyed through the medium of the newspapers, that we feel somewhat at a loss to present any which may have a chance of being new to our readers. So early as his twentieth year, we find Mr Jeffrey thus sensibly expressing himself on an important subject:—

'There is nothing in the world I detest so much as companions and acquaintances, as they are called. Where intimacy has gone so far as to banish reserve,

to disclose character, and to communicate the reality of serious opinions, the connection may be the source of much pleasure—it may ripen into friendship, or subside into esteem. But to know half a hundred fellows just so far as to speak, and walk, and lounge with them; to be acquainted with a multitude of people, for all of whom together you do not care one farthing; in whose company you speak without any meaning, and laugh without any enjoyment; whom you leave without any regret, and rejoin without any satisfaction; from whom you learn nothing, and in whom you love nothing—to have such a set for your society, is worse than to live in absolute solitude; and is a thousand times more pernicious to the faculties of social enjoyment, by circulating in its channels a stream so insipid.

At the peace of Amiens, Jeffrey wrote thus to his friend Morehead, 7th October 1801: 'It is the only public event in my recollection that has given me any lively sensation of pleasure, and I have rejoiced at it as heartily as it is possible for a private man, and one whose own condition is not immediately affected by it, to do. How many parents and children, and sisters and brothers, would that news make happy? How many pairs of bright eyes would weep over that gazette, and wet its brown pages with tears of gratitude and rapture? How many weary wretches will it deliver from camps and hospitals, and restore once more to the comforts of a peaceful and industrious life? What are victories to rejoice at, compared with an event like this? Your bonfires and illuminations are dimmed with blood and with tears, and battle is in itself a great evil, and a subject of general grief and lamentation. The victors are only the least unfortunate, and suffering and death have, in general, brought us no nearer to tranquillity and happiness.' It may be well thus to bring the value of a peace before the public mind. Let those who only know of war from history, reflect how great must be the evils of a state the cessation of which gives such a feeling of relief.

Here is a curious passage about the society of Liverpool in 1813, and his love of his native country. We must receive the statement respecting the Quakers with something more than doubt, at least as to the extent to which it is true:—'I have been dining out every day for this last week with Unitarians, and Whigs, and Americans, and brokers, and bankers, and small fanciers of pictures and paints, and the Quaker aristocracy, and the fashionable vulgar, of the place. But I do not like Liverpool much better, and could not live here with any comfort. Indeed, I believe I could not live anywhere out of Scotland. All my recollections are Scottish, and consequently all my imaginations; and though I thank God that I have as few fixed opinions as any man of my standing, yet all the elements out of which they are made have a certain national cast also. In short, I will not live anywhere else if I can help it; nor die either; and all old Esay's* eloquence would have been thrown away in an attempt to persuade me that *banishment furth the kingdom* might be patiently endured. I take more to Roscoe, however: he is thoroughly good-hearted, and has a sincere, though foolish concern for the country. I have also found out a Highland woman with much of the mountain accent, and sometimes get a little girl to talk to. But with all these resources, and the aid of the Botanical Garden, the time passes rather heavily; and I am in some danger of dying of ennui, with the apparent symptoms of extreme vivacity. Did you ever hear that most of the Quakers die of stupidity—actually and literally? I was assured of the fact the other day by a very in-

telligent physician, who practised twenty years among them, and informs me that few of the richer sort live to be fifty, but die of a sort of atrophy, their cold blood just stagnating by degrees among their flabby fat. They eat too much, he says; take little exercise; and, above all, have no nervous excitement. The affection is known in this part of the country by the name of *the Quaker's disease*, and more than one-half of them go out so. I think this curious, though not worth coming to Liverpool to hear, or writing from Liverpool, &c.'

He was at this time about to sail for America, in order to marry a lady of that country. In a letter to Morehead, he recalls his old-fashioned country residence of Hatton, in West Lothian, and Mr Morehead's family now resident there. Tuckey was a nickname for one of Mr Morehead's daughters; Margaret was another. Till the last, he had pet names for all his own descendants and relatives, having no doubt felt how much they contribute to the promotion of family affection. 'I am almost ashamed of the degree of sorrow I feel at leaving all the early and long-prized objects of my affection; and though I am persuaded I do right in the step which I am taking, I cannot help wishing that it had not been quite so wide and laborious a one. You cannot think how beautiful Hatton appears at this moment in my imagination, nor with what strong emotion I fancy I hear Tuckey telling a story on my knee, and see Margaret poring upon her French before me. It is in your family that my taste for domestic society and domestic enjoyments has been nurtured and preserved. Such a child as Tuckey I shall never see again in this world. Heaven bless her, and she will be a blessing both to her mother and to you.' After touching upon a volume of poems which Mr Morehead had published—'If I were you, however, I would live more with Tuckey, and be satisfied with my gardening and pruning—with my preaching—a good deal of walking and comfortable talking. What more has life? and how full of vexation are all ambitious fancies and perplexing pursuits! Well, God bless you! Perhaps I shall not have an opportunity to inculcate my innocent epicurism upon you for a long time again. It will do you no harm.'

It will be a new fact to most of the admirers of Jeffrey, that he had in early life devoted himself to the writing of poetry. Of what he wrote between 1791 and 1796, the greater part has disappeared from his repositories. 'But,' says his biographer, 'enough survives to attest his industry, and to enable us to appreciate his powers. There are some loose leaves and fragments of small poems, mostly on the usual subjects of love and scenery, and in the form of odes, sonnets, elegies, &c.; all serious, none personal or satirical. And besides these slight things, there is a completed poem on *Dreaming*, in blank verse, about 1800 lines long. The first page is dated Edinburgh, May 4, 1791, the last Edinburgh, 25th June 1791; from which I presume that we are to hold it to have been all written in these fifty-three days—a fact which accounts for the absence of high poetry, though there be a number of poetical conceptions and flowing sentences. Then there is a translation into blank verse of the third book of the *Argonauticon* of Apollonius Rhodius. The other books are lost, but he translated the whole poem, extending to about 6000 lines. . . . And I may mention here, though it happens to be in prose, that of two plays, one, a tragedy, survives. It has no title, but is complete in all its other parts. . . . He was fond of parodying the *Odes* of Horace, with applications to modern incidents and people, and did it very successfully. The *Otium Divos* was long remembered. Notwithstanding this perseverance, and a decided poetical ambition, he was never without misgivings as to his success. I have been informed, that he once went so far as to leave a poem with a bookseller, to be published, and fled to the

* Lord Esqgrove, a judge, who consoled a friend he was obliged to banish, by assuring him that there really were places in the world, such as England, for example, where a man, though out of Scotland, might live with some little comfort.

country; and that, finding some obstacle had occurred, he returned, recovered the manuscript, rejoicing that he had been saved, and never renewed so perilous an experiment.

There may be some who would like to see these compositions, or specimens of them, both on their own account, and that the friends of the many poets his criticism has offended might have an opportunity of retaliation, and of shewing, by the critic's own productions, how little, in their opinion, he was worthy to sit in judgment on others. But I cannot indulge them. Since Jeffrey, though fond of playing with verses privately, never delivered himself up to the public as the author of any, I cannot think that it would be right in any one else to exhibit him in this capacity. I may acknowledge, however, that, so far as I can judge, the publication of such of his poetical attempts as remain, though it might shew his industry and ambition, would not give him the poetical wreath, and of course would not raise his reputation. Not that there are not tons of worse verse published, and bought, and even read, every year, but that their publication would not elevate Jeffrey. His poetry is less poetical than his prose. Viewed as mere literary practice, it is rather respectable. It evinces a general acquaintance, and a strong sympathy, with moral emotion, great command of language, correct taste, and a copious possession of the poetical commonplaces, both of words and of sentiment. But all this may be without good poetry.

Having given little of Lord Cockburn in our extracts, we shall conclude with a passage of his narration which stands out distinctly, and has a historical value. It refers to Edinburgh in the second decade of the present century, but takes in a few names of deceased celebrities:—'The society of Edinburgh was not that of a provincial town, and cannot be judged of by any such standard. It was metropolitan. Trade or manufactures have, fortunately, never marked this city for their own; but it is honoured by the presence of a college famous throughout the world, and from which the world has been supplied with many of the distinguished men who have shone in it. It is the seat of the supreme courts of justice, and of the annual convocation of the Church, formerly no small matter; and of almost all the government offices and influence. At the period I am referring to, this combination of quiet with aristocracy made it the resort, to a far greater extent than it is now, of the families of the gentry, who used to leave their country residences and enjoy the gaiety and the fashion which their presence tended to promote. Many of the curious characters and habits of the receding age—the last purely Scotch age that Scotland was destined to see—still lingered among us. Several were then to be met with who had seen the Pretender, with his court and his wild followers, in the Palace of Holyrood. Almost the whole official state, as settled at the Union, survived; and all graced the capital, unconscious of the economical scythe which has since mowed it down. All our nobility had not then fled. A few had sense not to feel degraded by being happy at home. The Old Town was not quite deserted. Many of our principal people still dignified its picturesque recesses and historical mansions, and were dignified by them. The closing of the continent sent many excellent English families and youths among us, for education and for pleasure. The war brightened us with uniforms, and strangers, and shows.

Over all this, there was diffused the influence of a greater number of persons attached to literature and science, some as their calling, and some for pleasure, than could be found, in proportion to the population, in any other city in the empire. Within a few years, including the period I am speaking of, the College contained Principal Robertson, Joseph Black, his successor Hope, the second Munro, James Gregory, John Robison, John Playfair, and Dugald Stewart; none of them

confined monastically to their books, but all—except Robison, who was in bad health—partaking of the enjoyments of the world. Episcopacy gave us the Rev. Archibald Alison; and in Blair, Henry, John Home, Sir Harry Moncreiff, and others, Presbytery made an excellent contribution, the more to be admired that it came from a church which eschews rank, and boasts of poverty. The law, to which Edinburgh has always been so largely indebted, sent its copious supplies; who, instead of disturbing good company by professional matter—an offence with which the lawyers of every place are charged—were remarkably free of this vulgarity; and being trained to take difference of opinion easily, and to conduct discussions with forbearance, were, without undue obtrusion, the most cheerful people that were to be met with. Lords Monboddo, Hailes, Glenlee, Meadowbank, and Woodhouselee, all literary judges, and Robert Blair, Henry Erskine, and Henry Mackenzie, senior, were at the earlier end of this file; Scott and Jeffrey at the later—but including a variety of valuable persons between these extremities. Sir William Forbes, Sir James Hall, and Mr Clerk of Eldin, represented a class of country gentlemen cultivating learning on its account. And there were several, who, like the founder of the Huttonian theory, selected this city for their residence solely from the consideration in which science and letters were here held, and the facilities, or rather the temptations, presented for their prosecution. Philosophy had become indigenous in the place, and all classes, even in their gayest hours, were proud of the presence of its cultivators. Thus learning was improved by society, and society by learning. And unless when party-spirit interfered—which at one time, however, it did frequently and bitterly—perfect harmony, and, indeed, lively cordiality, prevailed.

And all this was still a Scotch scene. The whole country had not begun to be absorbed in the ocean of London. There were still little great places—places with attractions quite sufficient to retain men of talent or learning in their comfortable and respectable provincial positions, and which were dignified by the tastes and institutions which learning and talent naturally rear. The operation of the commercial principle which tempts all superiority to try its fortune in the greatest accessible market, is perhaps irresistible; but anything is surely to be lamented which annihilates local intellect, and degrades the provincial spheres which intellect and its consequences can alone adorn. According to the modern rate of travelling, the capitals of Scotland and of England were then about 2400 miles asunder. Edinburgh was still more distant in its style and habits. It had then its own independent tastes, and ideas, and pursuits. Enough of the generation that was retiring survived to cast an antiquarian air over the city, and the generation that was advancing was still a Scotch production. Its character may be estimated by the names I have mentioned, and by the fact, that the genius of Scott and of Jeffrey had made it the seat at once of the most popular poetry and the most brilliant criticism that then existed. This city has advantages, including its being the capital of Scotland, its old reputation, and its external beauties, which have enabled it, in a certain degree, to resist the centralising tendency, and have hitherto always supplied it with a succession of eminent men. But now that London is at our door, how precarious is our hold of them, and how many have we lost!

We would just add one remark which occurs to us after reviewing the career of this eminent patriot and writer, and it may be of service to young men now entering upon the various paths of ambition. It is the fortune of many to be led by whim, prejudice, and other reasons, into certain tracks of opinion, which, as they do not lead to the public good, so neither do they conduce to any ultimate benefit for those treading

them. How striking the contrast between the retrospect of a literary man, who has spent, perhaps, brilliant abilities in supporting every bad cause and every condemned error of his time, and necessarily found all barren at last, and the reflections of one like Francis Jeffrey, who, having embraced just views at first, continued temperately to advocate them until he saw them adopted as necessary for the good of his country, and had the glory of being almost universally thanked for his share in bringing about their triumph! Let young literary men particularly take this duly to heart, for it may save them from many a bitter pang in their latter days.

THE MOONLIGHT RIDE.

A NUMBER of years ago, a gentleman in Clydesdale offered me a situation as head-groom, which I accepted. He had one horse which was kept in a stable by himself, and was, without exception, the ugliest and most savage animal of his kind I had ever seen. There was not a single point of a strong or a fast horse about him. He was as black as charcoal; he was named Satan, and richly did he deserve the name. He would fly at you, like a dog, with his teeth; attempt to beat you down with his fore-feet; and strike round a corner at you with his hind ones. He had beaten off all the rough-riders, grooms, and jockeys in that part of the country.

After being in the place for a few days, I was asked by the gentleman, if I thought I could make anything of Satan. I replied, that if he beat me, he would be the only horse which had ever done so; but still I considered him to be by far the most savage I had ever seen. 'Try him to-morrow at one o'clock,' said he, as he turned to go away: 'I will have a few friends with me to see how you succeed.'

I determined, however, to try him that night, and without any witness to see whether I succeeded or not. My room was over the stables, and as the moon did not rise till eleven o'clock, I threw myself upon the bedclothes, and, contrary to my intention, fell asleep. When I awoke, it was twelve, the moon was shining brightly, and rendering everything as visible as if it were day.

I went down to the stable with a bridle prepared for the purpose, and a heavily-loaded whip in my hand. I knew that it would be impossible to saddle him; and, indeed, I should be safer on his bare back, in the event of his throwing himself down. I opened the stable-door gently, and there he was prone on his side, his legs and neck stretched out, as I have often seen horses lying after sore fatigue. I clapped my knee upon his head, loosed the collar that bound him, slipped the bit into his mouth, buckled the throat-band, raised him to his feet, backed him out, and leaped upon his back before he had time to get his eyes right opened. But open them now he did, and that with a vengeance; he pawed, and struck the walls with his fore-feet, till the fire flashed from the stones; and then he reared till he fell right back upon the pavement. I was prepared for this, and slipped off him as he went down, and then leaped on him again as he rose. I had not as yet touched him with whip, bridle, or spur; but now I gave him the curb and the spurs at the same instant. He gave one mad bound, and then went off at a rate that completely eclipsed the speed of the fleetest horse I had ever ridden. He could not trot, but his gallop was unapproachable, and consisted in a succession of leaps, performed with a precision, velocity, and strength, absolutely bewildering.

He fairly overturned all my preconceived notions of a fast horse. On he thundered, till we came under the shadow of a fir-wood, and then, whether out of mischief or dread of the darkness, he halted instantaneously, his fore-feet so close together that you might have put them

into a bucket. Owing to the depression of his shoulders—for he had no more withers than an ass—the way that he jerked down his head, and the suddenness of the stop, a monkey, although he had been holding on with his teeth, must have been unseated. For me, I was pitched a long way over his head, but alighted upon a spot so soft and mossy, that it looked as if some kind hand had purposely prepared it for me. Had I been in the slightest degree stunned, or unable to regain my feet, that instant he would have torn me to pieces with his teeth, and beaten my mangled body into the earth with his hoofs. But I at once sprang to my feet, and faced him. I could have escaped by leaping into the wood; but my blood was up, my brain clear, and my heart gave not one extra pulsation. There he stood upon his hind-legs nearly upright, beating the air with his fore-feet, his mouth open, his upper lip curled, his under one drawn down, his large white teeth glancing like ivory in the moonlight. As soon as he saw me upon my feet, he gave a yell such as I had never heard from a horse before, save once, and which I believe is never elicited from that animal, except when under the domination of frantic rage or fear.

This unearthly cry roused every living thing within hearing. An army of rooks, startled from their encampment in the wood, circled and wheeled between us and the moon, shading her light; and filling the midnight air with their discordant screams. This attracted the attention of Satan, and, bringing his fore-feet to the ground, he pricked up his ears, and listened. I sprang forward, seized him by the mane, and vaulted upon his back. As I stooped forward to gather up the reins, which were dangling from his head, he caught me by the cuff of the jacket—luckily it was but the cuff!—and tore it up to the shoulder. Instantly he seized me again; but this time he succeeded rather better, having a small portion of the skin and flesh of my thigh between his teeth. The intense pain occasioned by the bite, or rather bruise, of a horse's mouth, can only be properly judged of by those who have felt it. I was the madder of the two now; and of all animals, an enraged man is the most dangerous and the most fearless. I gave him a blow between the ears with the end of the whip; and he went down at once, stunned and senseless, with his legs doubled up under him, and his nose buried in the ground. I drew his fore-legs from under him, that he might rise the more readily, and then lashed him into life. He turned his head slowly round, and looked at me, and then I saw that the savage glare of his eye was nearly quenched, and that, if I could follow up the advantage I had gained, I should ultimately be the conqueror. I now assisted him to rise, mounted him, and struck at once with whip and spur. He gave a few bounds forward, a stagger or two, and then fell heavily upon his side. I was nearly under him; however, I did save my distance, although that was all. I now began to feel sorry for him; his wonderful speed had won my respect; and as I was far from being naturally cruel, whip or spur I never used except in cases of necessity: so I thought I would allow him to lie for a few minutes, if he did not incline to get up of himself. However, as I had no faith in the creature, I sat down upon him, and watched him intently. He lay motionless, with his eyes shut; and had it not been for the firm and fast beat of his heart, I should have considered him dying from the effects of the blow; but the strong pulsation told me that there was plenty of life in him; and I suspected that he was lying quiet, meditating mischief. I was right. Every muscle began presently to quiver with suppressed rage. He opened his eyes, and gave me a look, in which fear and fury were strangely blended. I am not without superstition, and for an instant I quailed under that look, as the thought struck me, that the black, unshapely brute before me might actually be the spirit indicated by his name. With a muttered growl at my folly, I threw the

idea from me—leaped up—seized the reins—with a lash and a cry made him spring to his feet—mounted him as he rose, and struck the spurs into his sides. He reared and wheeled; but finding that he could not get rid of me, and being unable to stand the torture of the spurs, which I used freely (it was no time for mercy!) he gave two or three plunges, and then bounded away at that dreadful leaping gallop—that pace which seemed peculiarly his own. I tried to moderate his speed with the bridle; but found, to my surprise, that I had no command over him. I knew at once that something was wrong, as, with the bit I had in his mouth, I ought to have had the power to have broken his jawbone. I stooped forward to ascertain the cause; the loose curb dangling at the side of his head gave a satisfactory explanation.

He had it all his own way now; he was fairly off with me; and all I could do was to bear his head as well up as I could, to prevent him from stumbling. However, as it would have been bad policy to let him know how much he was master, I gave him an occasional touch with the spur, as if wishing him to accelerate his pace; and when he made an extra bound, I patted him on the neck, as if pleased with his performance.

A watery cloud was passing over the face of the moon, which rendered everything dim and indistinct, as we tore away down a grassy slope; the view terminating in a grove of tall trees, situated upon a rising-ground. Beyond the dark outline of the trees, I saw nothing.

As we neared the grove, Satan slackened his speed; this I thought he did with a view to crush me against the trunks of the trees. To prevent him from having time to do this, I struck him with the spurs, and away again he went like fury. As he burst through the trees, I flung my head forward upon his neck, to prevent myself from being swept off by the lower branches. In doing this, the spurs accidentally came in contact with his sides. He gave one tremendous leap forward—the ground sank under his feet—the horse was thrown over his own head—I was jerked into the air—and, amid an avalanche of earth and stones, we were hurled down a perpendicular bank into the brown, swollen waters of the Clyde.

Owing to a bend in the river, the force of the current was directed against this particular spot, and had undermined it; and although strong enough to bear a man or a horse, under ordinary circumstances, yet down at once it thundered under the desperate leap of Satan. However, it did not signify, as nothing could have prevented us from surging into the water at the next bound.

A large quantity of rain had fallen in the upper part of the shire; and, in consequence, the river was full from bank to brae. I was nearly a stranger to the place; indeed, so much so, that I had supposed we were running from the river. This, combined with the suddenness of the shock, and the appearance of a turbid, rapid river—sweeping down trees, brushwood, branches, hay, corn, and straw before it, with resistless force—was so foreign to my idea of the calm, peaceful Clyde, that when I rose to the surface, I was quite bewildered, and had very serious doubts as to my own identity.

I was roused from this state of bewilderment by the snorting and splashing of the horse: he was making a bold attempt to scale the perpendicular bank. Had I been thrown into the body of the stream, I should have been swept away, and the animal must have perished; but in all heavy rapid runs of water, salt or fresh, there is what is termed an eddy stream, running close in-shore, in a contrary direction to the main body of the water. I have seen Highlanders in their boats catching fish in the eddy stream of the Gulf of Corrievrekin, within a short distance of the main tide, which, had it

but got the slightest hold on their boat, would have swept them with fearful velocity into the jaws of the roaring gulf. I was caught by this eddy, which kept me stationary, and enabled me, by a few strokes, to reach the horse's side. To cross the river, or to land here, was alike impossible; so I took the reins in my right hand, wheeled the horse from the bank, and dashed at once with him into the strength of the current. Away we went, Satan and I, in capital spirits both; not a doubt of our effecting a safe landing ever crossing my mind. And the horse evinced his certainty upon that subject, by snatching a bite out of a heap of hay that floated at his side, and eating it as composedly as if he had been in the stable.

We soon swept round the high bank that had caused our misfortune, and came to a level part of the country, which was flooded far up into the fields. I then struck strongly out in a slanting direction for the shore, and soon had the satisfaction of finding myself once more upon the green turf. Satan shook himself, pricked up his ears, and gave a low neigh. I then stroked him, and spoke kindly to him. He returned the caress by licking my hand. Poor fellow! he had contracted a friendship for me in the water—a friendship which terminated only with his life; and which was rendered the more valuable, by his never extending it to another living thing.

THE GOLD-FEVER IN AUSTRALIA.

THE discovery of gold in the new continent has thrown the country into a state which well merits examination. The same circumstance in California was no interruption to progress of any kind. It merely peopled a desert, and opened a trade where there was none before; while in Australia it finds an established form of civilisation, and a commerce flowing in recognised channels. It is an interesting task, therefore, to trace the nature of the influence exercised in the latter country over old pursuits by the new direction of industry; and it is with some curiosity we open a mercantile circular, dated Sydney, 1st November 1851. This, we admit, is a somewhat forbidding document to mere literary readers; but we shall divest its contents of their technical form, and endeavour, by their aid, to arrive at some general idea of the real state and prospects of the colony.

Up to the middle of last May, the colonial heart beat high with hope. Trade was good; the pastoral interests were flourishing; the country properties, as a matter of course, were improving; and the introduction of the alpaca, the extended culture of the vine, and the growth of cotton, appeared to present new and rich sources of wealth. At that moment came the discovery of the Gold Fields; and a shock was communicated to the whole industrial system, which to some people seemed to threaten almost annihilation. The idea was, that gold-digging would swallow up all other pursuits, and the flocks perish in the wilderness from the want of shepherds. Nor was this altogether without foundation; for the stockholders have actually been considerable sufferers: all the industrial projects mentioned have been stopped short; and the gold-diggings still continue to attract to themselves, as if by a spell, the labour of the country. The panic, however, has now subsided. It is seen that the result is not so bad as was anticipated, and hopes are entertained that the evil will go no further. A stream of population, it is thought, will be directed to Australia from abroad, and the labour not demanded by gold may suffice for other pursuits. Up to the date of the circular, the value of gold shipped for England

from New South Wales had been L.217,000, and it was supposed that about L.180,000 more remained at Sydney and in the hands of the miners: 10,000 persons were actually engaged in mining, and 5000 more concerned otherwise in the business; and as the result of the exertions of that multitude, the amount of gold fixed arbitrarily for exportation during the next twelve months, is L.2,000,000.

But, on the other hand, in the Sydney district alone, the trade in wool has already fallen off to the extent of several thousand bales—a deficiency, however, not as yet attributed to the diminished number of the sheep. It is supposed that the high rates of labour will operate chiefly in disinclining the farmers to extend their operations; and if this at the same time affords them leisure and motive to attend better to the state of their clips, it will ultimately have an effect rather beneficial than otherwise. Australian wool has hitherto been attainable by foreigners only in the English market; but it is a favourable symptom that two cargoes left Sydney last year direct for Hamburg. To shew the falling off in trade during the gold year, it may be mentioned that the exports of wool in the two previous years were about 52,000 bales; and in 1850-1, about 48,000. There was likewise a deficiency of about 6000 casks of tallow, and 3000 hides.

It is interesting to notice, that preserved meats are sent from New South Wales to the neighbouring colonies and to England in considerable quantities. Timber for shipbuilding is rising in estimation in the English market. Australian wines are said to be fully equal to Rhenish; and a Vineyard Association has been formed for the purpose of improvement. Wool, however, is at present the great staple; and the Circular seems to derive some consolation from the idea, that if the crop should continue deficient, prices in England will probably be maintained. 'To anticipate the future prices for our staples,' it says, 'in a market open to so many influences as that of Great Britain, is almost impossible; but it may be well to point out the causes which are likely to affect their value—we allude more especially to wool. We have stated that the production thereof, in New South Wales, is likely to be checked by the attraction of the gold-diggings; and still further, by the gradual abandonment of indifferent or limited runs, which formerly supported a large number of sheep, but which will not pay to work at present prices of wool and labour. Therefore, if we bear in mind that Australia has furnished half of the entire quantity of the wools imported into Great Britain, and that the English buyers have hitherto been purchasing in anticipation of a large annual increase from hence, which for the present, at any rate, will not be forthcoming, we think we need be under no apprehension of lower prices than the present.'

It will be remarked, that this somewhat unfavourable report is made at the end of the first six months of the gold-fever. That kind of gold-seeking, however, which unsettles the habits of a population, and represses the other pursuits of industry, is not likely to endure very long in any country. It must give way in time to scientific mining, which is as legitimate a business as any other, and which, by the wealth it circulates, will tempt men into new avenues of industry, and recruit, to any extent that may be desirable, the supply of labour. Hitherto that supply has come in inadequate quantities, or from polluted sources; but we have now precisely what the colony wanted—a stream of voluntary emigration, which, in the process of time, when

skilled labour only can be employed, will flood the diggings, and its superfluous portions find their level in the other employments afforded by the country. That this will take place without the inconvenience of a transition period, is not to be expected; but, upon the whole, we look upon the present depression of the legitimate trade of the colony as merely a temporary evil, arising out of circumstances that are destined to work well for its eventual prosperity.

The same process, it should be observed, has already been gone through in California. The lawless adventurers who rushed to the gold-fields from all parts of the world subsided gradually into order from mere motives of self-preservation; and as the precious metal disappeared from the surface, multitudes were driven by necessity or policy into employments more remunerative than digging. The large mining population—the producers of gold—became the consumers of goods; markets of all kinds were opened for their supply; emporia of trade rose along the coast; and a country that so recently was almost a desert, now promises to become one of the great marts of the commerce of the world. If this has been the case in California, the process will be much easier in Australia, where the rudiments of various businesses already exist, and where the staple articles of produce are such as can hardly be pushed to a superfluous extent.

The true calamity, however, under which the fixed colonists, the producers of the staples, suppose themselves to suffer, is the change occasioned in the price of labour by the golden prospects of the diggings. On this question there is always considered to be two antagonistical interests—that of the employers, and that of the employed; the former contending for the minimum, and the latter for the maximum rate. But this is a fallacy. The interest of the two is identical; and for these obvious reasons, that if wages be too high, the capitalist must cease to produce and to employ; and if too low, the working population must sink to the position of unskilled labourers at home, and eventually bring about that very state of society from which emigration is sought as an escape. In supposing their interests to be antagonistical, the one party reasons as badly as the other; but, somehow, there always attaches to the bad reasoning of the employed a stigma of criminality, from which that of the other is free. This is unjust enough in England, but in Australia it is ridiculous. A capitalist goes out, provided with a sum so small as to be altogether useless at home as a means of permanent support, but which, in the colony, he expects, with proper management, to place him for the rest of his life in a position of almost fabulous prosperity. These cheering views, however, he confines to his own class. The measure of his happiness will not be full unless he can find cheap labour, as well as magnificent returns. For this desideratum he will make any sacrifice. He will take your paupers, your felons—your rattlesnakes; anything in the shape of a drudge, who will toil for mere subsistence, and without one of the social compensations which render toil in England almost endurable.

We are never sorry to hear of the high price of labour in countries where the employers live in ease and independence; and we join heartily in the counsel to the higher class of working-men in this country given by Mr Burton in his *Emigrant's Manual*—'never to confound a large labour-market with good sources of employment.' It does not appear to us to be one of the least of the benefits that will accrue after convalescence from the gold-fever in Australia, the higher value the employed will set upon their labour. We cannot reason from the English standard, which has not been deliberately fixed, but forced upon us by competition, excessive population, public burdens, and the necessities of social position. In a new country, however, where all these circumstances are absent, and whither

employers and employed resort alike for the purpose of bettering their condition, we should like to see traditions cast aside, and the fabric of society erected on a new basis.

BURGOMASTER LAW IN PRUSSIA.

On turning out, and then turning over, a mass of old papers which had lain packed up in a heavy mail-trunk for a period of more than forty years, I came the other day upon a little bundle of documents in legal German manuscript, the sight of which set me, old as I am, a laughing involuntarily, and brought back in full force to my memory the circumstances which I am about briefly to relate. A strange thing is this memory, by the way, and strangely moved by trifles to the exercise of its marvellous power. For more than thirty years—for the average period that suffices to change the generation of man upon earth—had this preposterous adventure, and everything connected with it, lain dormant in some sealed-up cavity of my brain, when the bare sight of the little bundle of small-sized German foolscap, with its ragged edges and blotted official pages, has set the whole paltry drama, with all its dignified performers, in motion before the retina of my mind's eye with all the reality of the actual occurrence.

It was in the spring or early summer of the year 1806, that, in the capacity of companion and interpreter to a young nobleman who was making the tour of Germany, I was travelling on the high-road from Magdeburg to Berlin. We rolled along in a stout English carriage drawn by German post-horses, and having left Magdeburg after an early breakfast, stopped at a small neat town, some eighteen or twenty miles on our route—my patron intending to remain there for an hour or two, in the hope of being rejoined by a friend who had promised to overtake us. He ordered refreshment, and sat down and partook of it, while I, not choosing to participate, seated myself in the recess of an old-fashioned window, and kept my eyes fixed upon our travelling-carriage, from which the wearied horses had been removed, and which stood but a few paces from where I sat. At the end of an hour, my patron having satisfied his appetite, declined to wait any longer, and proposed that we should proceed on our journey. It was my office to discharge all accounts, and of course to check any attempt at speculation which might be made. I summoned the innkeeper, whose just demand was soon paid, and ordered the horses to be put to. This was done in a few minutes, and the stable-man, as we walked out to the carriage, came forward and presented his little bill. As I ran it hastily over before paying it, I saw that the rascal had charged for services which he had not rendered. With the design of making the most of a chance-customer, he had put down in his account a charge for greasing the wheels of the carriage. Now, as I had never taken my eyes from the carriage during the whole period of our stay, I could not be deceived in the conviction that this was a fraud. True, it was the merest trifle in the world; but the fellow who wanted to exact it was the model of an ugly, impudent, and barefaced rogue, and therefore I resolved not to pay him. Throwing him the money, minus the attempted imposition, I told him to consider himself fortunate that he had got that, which was more than such a rogue—*schurke* was the word I used—deserved.

'Do you call me a rogue?' said he.

'Certainly; a rogue is your right name,' I replied, and sprang into the carriage.

'Ho! ho!' said he; 'that is against the law. Hans Felder,' he bawled to the postilion, 'I charge you not to move; the horses may be led back to the stable: the gracious gentleman has called me a rogue. Stiefel, run for the police: the gracious gentleman says I am a rogue. I will cite him before the council.'

It was in vain that I put my head out of the window,

and bawled to the postilion to proceed. He was evidently afraid to move. In a few minutes a crowd began to collect around us, and in less than a quarter of an hour half the inhabitants of the place had assembled in front of the inn. The noise of a perfect Babel succeeded in an instant to the dull silence of the quiet town. I soon gathered from the vehement disputes that arose on all sides, that the populace were about equally divided into two parties. The more reasonable portion were for allowing us to proceed on our journey, and this would perhaps have been permitted, had not my companion, on understanding what was the matter, burst into an uncontrollable fit of laughter, and repeated the offensive word, accompanying it with a declaration in French, which many of the bystanders understood, that he considered it generally applicable. The landlord of the inn now came forth, and after a not very energetic attempt to conciliate the oetler, who refused to forego his determination to obtain legal redress, invited us to alight and resume our quarters in the inn. This we were compelled to do, to escape the annoyance of the crowd; and the carriage being housed under a shed, the horses returned to the stable. We had not been three minutes in the inn before the police appeared to take me into custody, and march me off to durance vile. By this time I began to see that the charge, and the dilemma into which it had led us, was no joke. I might perhaps have bribed the scoundrel who preferred it, and have sent away the police with a gratuity; but I felt as little disposed to do that as to go to prison. I refused to leave the inn, protested against the jurisdiction of their absurd laws over strangers, and at length, with the assistance of my companion, and a good deal of threatening talk, succeeded in ejecting the two police functionaries from the room. They kept watch, however, at the door, and planted sentinels at the windows, to prevent an ignominious flight that way.

In the meanwhile, the whole town was in commotion, and everybody was hurrying towards the *rathhaus*, or town-hall, where it was plain enough that preparations were making for putting me immediately upon my trial. I saw the old *burgermeister* go waddling by in his robe of office, accompanied by a crowd of nondescript officials, with one of whom my villainous-looking adversary was in close confabulation. In a short space of time, a band of very scurvy-looking police, plainly vamped up for the occasion, made its appearance; and one of the band entering the room without ceremony, presented me with a summons, couched in legal diction, citing me to appear instantly before the commission then sitting, to answer an indictment preferred against me by Karl Gurtler, Supernumerary Deputy Road Inspector of the district, whose honourable character I had unjustly and wantonly assailed and deteriorated by the application of the scandalous and defamatory term, *schurke*. There was nothing for it but to obey the mandate; and accordingly, requesting the bearer to convey my compliments to the assembled council, and to say that I would have the honour of attending them in a few minutes, I dismissed him, evidently soothed with my courteous reception. I did this with a view of getting rid of the *posse comitatus*, in whose company I did not much relish the idea of being escorted as a prisoner. My politeness, however, had not the anticipated effect, as, upon emerging from the inn, we found the whole squad waiting at the door as a sort of body-guard, to make sure of our attendance.

On arriving at the *rathhaus*, which was crammed to overflowing with all the inhabitants of the place who could possibly wedge themselves into it, way was cleared for us through the crowd to the seats which had been considerably allotted for us, in front of the tribunal. A more extraordinary bench of justice was perhaps never convened. It was plain that the little village was steeped in poverty to the lips, and that I, having been entrapped, through an unconscious expression,

in the meshes of some antiquated law, was doomed to administer in some measure to their need by the payment of a penalty and costs. The fat old fellow who presided as judge, and beneath whose robe of office an unctuous leathery surtout was all too visible, peered in vain through a pair of massive horn-spectacles into a huge timber-swathed volume in search of the act, the provisions of which I had violated. At length, the schoolmaster—a meagre, pensive-looking scarecrow, industriously patched all over—came to his assistance, turned over the ponderous code by which the little community were governed, and having rummaged out the law, and the clause under the provisions of which I had been so summarily arrested, handed it to the clerk, who I shrewdly suspected to be nothing more or less than the village barber. He, at the command of the judge, read it aloud for the information of all present, and for my especial admonition. From the contents, it appeared to have been decreed, how long ago I had no means of judging, that, for the better sustentation of good morals and good-breeding, and for the prevention of quarrelling, or unseemly and abusive conversation, any person who should call or designate any other person in the said town by the name of thief, villain, rascal, rogue (*schurke*), cheat, charlatan, impostor, wretch, coward, sneak, suborner, slanderer, tattler, and sundry other titles of ill-repute, which I cannot recollect now, and could not render into English were I to recall them, should, upon complaint of the person aggrieved, and upon proof of the offence by the evidence of worthy and truth-speaking witnesses, be amerced in such penalty, not exceeding a certain sum, as in the estimation of the presiding magistrate should be held to be a proper compensation for the injury to his reputation suffered by the plaintiff. When the clerk drew breath at the end of the long-winded clause, I inquired if the law in question made no counter-provision for cases which might occur where, the abusive term being richly deserved, it could be no crime to apply it. The schoolmaster, who, despite his patched habiliments, was a clever fellow, at once answered my question in the negative, and justified the omission of any such provision by contraverting the position I had advanced upon moral grounds. This he did in a speech of some length, and with remarkable ingenuity and good sense; proving—to the satisfaction of his fellow-townsmen at least—that to taunt a malefactor openly with his misdeeds, was not the way to reform him, while it was a sure mode of producing a contrary result; and winding up with an assurance, that the law was a good law, and perfect in all its parts; and that if I had suffered wrong, I might obtain at their hands redress as readily and with as much facility as my antagonist.

I had nothing to reply to this, and the proceedings went on in due form. Without being sworn, the plaintiff was called upon to state his case, which he did with an elaborate circumlocution altogether without a parallel in my experience. He detailed the whole history of his life—from his birth, in Wolfenbüttel, up to his seven years' service in the army; then followed his whole military career; and after that, his service under the *weg-inspector*, which was rewarded at length by the gratification of his honest ambition, in his appointment as supernumerary deputy road inspector of the district. He enlarged upon the service he had rendered to, and the honours he had received from, his country; and then put it to his judges to decide whether, as a public officer, a soldier, and a man of honour, he could submit to be stigmatised as a *schurke*, without appealing to the laws of his Fatherland to vindicate his character. Of course it was not to be thought of. He then detailed the circumstances of the assault I had made upon his character, forgetting to mention, however, the provocation he had given by the fraudulent charge for greasing. Having finished his peroration, he proceeded to call witnesses to the fact of

the abuse, and cited Hans Felder, our postilion, to be first examined. Hans, who had heard every syllable that passed, was not, however, so manageable a subject as the plaintiff expected to find him. Whether, like Toby Allspice in the play, he 'made it a rule never to disoblige a customer;' or whether, which was not unlikely, he owed Karl Gurtler a grudge, either for stopping him on his route, or for some previous disagreement with that conscientious public functionary; or whether, which was likeliest of all, he feared to compromise his claim for *trinkgeld* from the highborn, gracious gentlemen he had the honour of driving, I cannot pretend to determine. Certain it is, that when brought to the bar, he had heard nothing, and seen nothing, and knew nothing, and could recollect nothing, and say nothing, about the business in hand; and nothing but nothing could be got out of him by a single member of the bench, though all took him in hand by turns. He was finally sent down. By this time, so dilatory had been the proceedings, the sun was sinking in the west. My companion, weary of the prosecutor's long story, had withdrawn to the inn to order dinner. As the second witness was about to give his testimony, a note was handed to the old burgermeister, who, having given it a glance, immediately adjourned the court till the next morning at nine o'clock. The assembly broke up, and, returning to the inn, I found that the proceedings had been stopped by the landlord, to save the reputation of his cookery, which would have been endangered had the dinner waited much longer. Having first consulted my fellow-traveller, he had despatched directions to the judge to adjourn the case till the morrow, who, like a good and obliging neighbour, had accordingly done so.

The little town was unusually alive and excited that evening. Karl Gurtler was the centre of an admiring circle, who soon enveloped him in the incense of their meerschauts. He held a large levée in the common room of the inn, where a succession of very terrific battle-songs kept us up to a late hour, as it was of no use to think of slumber during their explosion. The next morning, at the appointed hour, the proceedings recommenced, and the remainder of the witnesses were examined at full length. It was in vain that I offered to plead guilty, and pay the penalty, whatever it might be, so that we might be allowed to proceed on our journey. I was solemnly reminded, that it was not for me to interrupt the course of justice, but to await its decision with patience. I saw they were determined to prevent our departure as long as possible; and, judging that the only way to assist in the completion of the unlucky business, was to interpose no obstacle to its natural course, I henceforth held my peace, conjuring my companion on no account to give directions for dinner. After a sitting of nearly seven hours on the second day, when everything that could be lugged into connection with the silly affair had been said and reiterated ten times over, the notary in attendance read over his condensed report of the whole, and I was called upon for my defence. I told them plainly that I did not choose to make any; that I was sick of the company of fools; that since it was a crime to speak the truth in their good town, I was willing to pay the penalty for so doing, for the privilege of leaving it; that I was astonished and disgusted at the spectacle of a company of grave men siding with such a beggarly *räuber* (I believed that term was not proscribed in their precious statute) as Karl Gurtler was, and taking advantage of the law, of which a stranger must necessarily be ignorant, to obstruct him on his journey, and levy a contribution on his purse; and I added, finally, for I had talked myself into an angry mood, that if the farce were not immediately brought to a conclusion, I should despatch my friend forthwith to Berlin, and lay a report of their proceedings before the British ambassador. I could perceive something like

consternation in the broad visage of the burgermeister as I concluded my harangue; but without attempting to answer it, the Solons on the bench laid their heads together, and after a muttering of a few minutes' duration, the schoolmaster pronounced the sentence of the court, which was, that I should indemnify the plaintiff to the amount of one dollar, and pay the costs of the proceedings, which amounted to three more. I could scarce forbear laughing at the mention of a sum so ludicrous. Fifteen shillings for penalty and costs of a trial which had lasted nearly two days! I threw down the money, and was hastening from the court, when the notary called upon me to stop for one moment, while he concluded his report of the case, to which, it appeared, their laws gave me a valid claim. I took the papers, and crammed them into my valise, in the hasty packing which took place so soon as I got back to my companion. In a quarter of an hour, we were on our road towards Berlin, having been taught a lesson of politeness, even towards rogues, at the expense of a stoppage of more than thirty hours on our route. I have no recollection how the papers found their way into the old trunk from which they were lately unkenelled. They are now before me, and consist of nearly fifty sides of small foolscap, written in a bold legal hand, affording a unique specimen of the cheapness of law amongst a community who, it is to be supposed, had but little demand for it.

A few short months after this event, and the little town where it took place, had something else to think of. The ill-advised step of the Prussian government, who, relying upon the aid of Russia, declared war against Napoleon, brought the devastating hordes of republican France among them. The battle of Jena placed the whole kingdom at the foot of the conqueror; and few towns suffered more, comparatively, than the little burgh which, by the decree of a very doubtful sort of justice, had mulcted me in penalties for calling a very ill-favoured rogue by his right name.

TRACES OF THE DANES AND NORWEGIANS IN ENGLAND.

MR J. J. A. WORSAAE, a conspicuous member of that brilliant corps of northern antiquaries who have of late given a new wing to history, travelled through the United Kingdom in 1846-7, on a commission from his sovereign the king of Denmark, to make inquiry respecting the monuments and memorials of the Danes and Norwegians, which might still be extant in these islands. The result of his investigations appeared in a concise volume, which has been translated into English, and published by Mr Murray in a handsome style, being illustrated by numerous wood-cuts.* It is a work which we would recommend to the attention of all who feel any interest in our early history, as calculated to afford them a great gratification. One is surprised to find in how great a degree the Northmen affected Britain; what an infusion of Scandinavian blood there is in our population; how many traces of their pre-dominance survive in names of places and in more tangible monuments. Mr Worsaae writes with a warm feeling towards his country and her historical reminiscences, but without allowing it to carry him into any extravagances. He is everywhere clear and simple—sometimes rises into eloquence; and always displays a close and searching knowledge of his subject.

From the end of the eighth century till the time of the Norman Conquest, the restless chiefs of Denmark and Norway were continually in the practice of making piratical expeditions to our shores. They committed

terrible devastations, and made many settlements, almost exclusively on the eastern coast. Finally, as is well known, we had a brief succession of Danish kings in England, including the magnanimous Canute. When we look at the quiet people now inhabiting Denmark and Norway, we are at a loss to understand whence came or where resided that spirit of reckless daring which inspired such a system of conquest, or how it came so completely to die out; but the explanation is, that the Northmen of those days were heathens, animated by a religion which made them utterly indifferent to danger. Whenever they became Christianised, they began to appreciate life like other men, and ceased, of course, to be the troublemakers they had once been. Mr Worsaae draws a line from London to Chester—the line of the great Roman road (Watling Street)—to the north of which the infusion of Scandinavian population is strong, and their monuments abundant. A vast number of names of places in that part of the island are of Danish origin—all ending in *by*, which in Danish signifies a town, as Whitby (the White Town), Derby (Deoraby, the town of Deer), Kirby (the church town), &c.—all ending in *thwaite*, which signifies an isolated piece of land—all ending in *thorpe* (Old Northern, a collection of houses separated from some principal estate)—all ending in *ness*, a promontory, and *ey* or *æ*, an island. *Toft*, a field; *with*, a forest; *beck*, a streamlet; *tarn*, a mountain-lake; *force*, a waterfall; *garth*, a large farm; *dale*, a valley; and *fell*, a mountain, are all of them common elements of names of places in England, north of the line above indicated, and all are Scandinavian terms. The terminations *by*, *thwaite*, and *thorpe*, are still common in Denmark.

Mr Worsaae found many memorials of the Northmen in London: for example, the church of St Clement's Danes, where this people had their burial-place; the name *Southwark*, which is 'unmistakably of Danish or Norwegian origin'; St Olave's Church there, and even Tooley Street, which is a corruption of the name of that celebrated Norsk saint; but, above all, in the fact that 'the highest tribunal in the city has retained in our day its pure old northern name "Husting." The fact is, that about the time of Canute, the Danes predominated over the rest of the population of London. Mr Worsaae was not able to trace the Danish face or form as a distinct element in the modern population. In going northward, however, he soon began to find that the prevailing physiognomy was of a northern character: 'The form of the face is broader, the cheek-bones project a little, the nose is somewhat flatter, and at times turned a little upwards; the eyes and hair are of a lighter colour, and even deep-red hair is far from being uncommon. The people are not very tall in stature, but usually more compact and strongly built than their countrymen towards the south. The Englishman himself seems to acknowledge that a difference is to be found in the appearance of the inhabitants of the northern and southern counties; at least, one constantly hears in England, when red-haired, compact-built men with broad faces are spoken of: "They must certainly be from Yorkshire;" a sort of admission that light hair, and the broad peculiar form of the face, belong mostly to the north of England people. . . . In the midland, and especially in the northern part of England, I saw every moment, and particularly in the rural districts, faces exactly resembling those at home. Had I met the same persons in Denmark or Norway, it would never have entered my mind that they were foreigners. Now and then I also met with some whose taller growth and sharper features reminded me of the inhabitants of South Jutland, or Sleswick, and particularly of Angeln; districts of Denmark which first sent colonists to England. It is not easy to describe peculiarities which can be appreciated in all their details only by the eye; nor dare I implicitly conclude that in the above-named cases I have really

* *An Account of the Danes and Norwegians in England, Scotland, and Ireland.* By J. J. A. Worsaae, For. F.S.A. London: Author of *Primæval Antiquities of Denmark.* London: Murray. 1852.

met with persons descended in a direct line from the old Northmen. I adduce it only as a striking fact, which will not escape the attention of at least any observant Scandinavian traveller, that the inhabitants of the north of England bear, on the whole, more than those of any other part of that country, an unmistakable personal resemblance to the Danes and Norwegians.

Scandinavian words abound in the popular language of those districts. 'On entering a house there, one will find the housewife sitting with her *rock* (Dan., *Rok*; Eng., a distaff) and *spoele* (Dan., *Spole*; Eng., spool, a small wheel on the spindle); or else she has set both her *rock* and her *garnwindle* (Dan., *Garnvinde*; Eng., reel or yarn-winder) aside, whilst standing by her *back-board* (Dan., *Bagebord*; Eng., baking-board) she is about to knead dough (Dan., *Deig*), in order to make the oaten-bread commonly used in these parts, at times, also, barley-bread; for *clap-bread* (Dan., *Klappebrød*, or thin cakes beaten out with the hand), she lays the dough on the *clap-board* (Dan., *Klappebord*.) One will also find the *bord-claith* spread (Dan., *Bordklæde*; Eng. table-cloth); the people of the house then sit on the *bank* or *bink* (Dan., *Bænk*; Eng., bench), and eat *Aandorn* (Eng., afternoon's repast), or, as it is called in Jutland and Fünen, *Onden* (dinner). The chimney (*lover*) stands in the room; which name may perhaps be connected with the Scandinavian *lyre* (Icelandic, *ljón*)—namely, the smoke-hole in the roof or thatch (*thack*), out of which, in olden times, before houses had regular chimneys and "*lofts*" (Dan., *Løft*; Eng., roof, an upper room), the smoke (*reak* or *reik*, Dan., *Røg*) left the dark (*mirk* or *murk*, Dan., *Mørk*) room. Within is the *bower* or *boor* (Eng., bed-chamber), in Danish, *Buur*; as, for instance, in the old Danish word *Jomfrubuur* (the maiden's chamber), and in the modern word *Fudebuur* (the pantry).'

Mr Worsaae only speaks the truth when he remarks how the name of the Danes has been impressed on the English mind. 'Legends about the Danes are,' he says, 'very much disseminated among the people, even in the south of England. There is scarce a parish that has not in some way or another preserved the remembrance of them. Sometimes, they are recorded to have burned churches and castles, and to have destroyed towns, whose inhabitants were put to the sword; sometimes, they are said to have burned or cut down forests; here are shewn the remains of large earthen mounds and fortifications which they erected; there, again, places are pointed out where bloody battles were fought with them. To this must be added the names of places—as, the *Danes-walls*, the *Danish forts*, the *Dane-field*, the *Dane-forest*, the *Danes-banks*, and many others of the like kind. Traces of Danish castles and ramparts are not only found in the southern and south-eastern parts of England, but also quite in the south-west, in Devonshire and Cornwall, where, under the name of *Castellon Danis*, they are particularly found on the sea-coast. In the chalk-cliffs, near Uffington, in Berkshire, is carved an enormous figure of a horse, more than 300 feet in length; which, the common people say, was executed in commemoration of a victory that King Alfred gained over the Danes in that neighbourhood. On the heights, near Eddington, were shewn not long since the intrenchments, which, it was asserted, the Danes had thrown up in the battle with Alfred. On the plain near Ashdon, in Essex, where it was formerly thought that the battle of Ashington had taken place, are to be seen some large Danish barrows which were long, but erroneously, said to contain the bones of the Danes who had fallen in it. The so-called dwarf-alder (*Sambucus ebulus*), which has red buds, and bears red berries, is said in England to have germinated from the blood of the fallen Danes, and is therefore also called *Daneblood* and *Danevoort*. It flourishes principally in the neighbourhood of Warwick; where it is said to have sprung from, and been dyed

by, the blood shed there, when Canute the Great took and destroyed the town.

'Monuments, the origin of which is in reality unknown, are, in the popular traditions, almost constantly attributed to the Danes. If the spade or the plough brings ancient arms and pieces of armour to light, it is rare that the labourer does not suppose them to have belonged to that people. But particularly if bones or joints of unusual size are found, they are at once concluded to be the remains of the gigantic Danes, whose immense bodily strength and never-failing courage had so often inspired their forefathers with terror. For though the Englishman has stories about the cruelties of the ancient Danes, their barbarousness, their love of drinking, and other vices, he has still preserved no slight degree of respect for Danish bravery and Danish achievements. "As brave as a Dane," is said to have been an old phrase in England; just as "to strike like a Dane" was, not long since, a proverb at Rome. Even in our days, Englishmen readily acknowledge that the Danes are the "best sailors on the continent;" nay, even that, themselves of course excepted, they are "the best and bravest sailors in all the world." It is, therefore, doubly natural that English legends should dwell with singular partiality on the memorials of the Danes' overthrow. Even the popular ballads revived and glorified the victories of the English. Down to the very latest times was heard in Holmesdale, in Surrey, on the borders of Kent, a song about a battle which the Danes had lost there in the tenth century.'

In our own northern land, the Northmen committed as many devastations, and made nearly as many settlements, as in England. The Orcadian Islands formed, indeed, a Norwegian kingdom, which was not entirely at an end till the thirteenth century. In that group, and on the adjacent coasts of Caithness and Sutherlandshires, the appearance of the people, the names of places, and the tangible monuments, speak strongly of a Scandinavian infusion into the population. Sometimes, between the early Celtic people still speaking their own language, and the descendants of the Norwegians, a surprisingly definite line can be drawn. The island of Harris is possessed for the most part by a set of Celts, 'small, dark-haired, and in general very ugly;' but at the northern point, called 'the Ness,' we meet with people of an entirely different appearance. 'Both the men and women have, in general, lighter hair, taller figures, and far handsomer features. I visited several of their cabins, and found myself surrounded by physiognomies so Norwegian, that I could have fancied myself in Scandinavia itself, if the Gaelic language now spoken by the people, and their wretched dwellings, had not reminded me that I was in one of those poor districts in the north-west of Europe where the Gaels or Celts are still allowed a scanty existence. The houses, as in Shetland, and partly in Orkney, are built of turf and unhewn stones, with a wretched straw or heather roof, held together by ropes laid across the ridge of the house, and fastened with stones at the ends. The houses are so low, that one may often see the children lie playing on the side of the roof. The family and the cattle dwell in the same apartment, and the fire, burning freely on the floor, fills the house with a thick smoke, which slowly finds its way out of the hole in the roof. The sleeping-places are, as usual, holes in the side-walls.

'It is but a little while ago that the inhabitants of the Ness, who are said to have preserved faint traditions of their origin from Lochlin—called also in Ireland, Lochlan—or the North, regarded themselves as being of better descent than their neighbours the Gaels. The descendants of the Norwegians seldom or never contracted marriage with natives of a more southern part of the island, but formed among themselves a separate community, distinguished even by a peculiar costume, entirely different from the Highland

Scotch dress. Although the inhabitants of Ness are now, for the most part, clothed like the rest of the people of Lewis, I was fortunate enough to see the dress of an old man of that district, which had been preserved as a curiosity. It was of thick, coarse woollen stuff, of a brown colour, and consisted of a close-fitting jacket, sewn in one piece, with a pair of short trousers, reaching only a little below the knees. It was formerly customary with them not to cover the head at all.

The people of the Ness are described as good fishermen—a striking trait of their original national character, for nothing could distinguish them more from their neighbours, the ordinary Highlanders being everywhere remarkable for their inaptitude to a sea-life.

Tradition speaks loudly all over Scotland of the ancient doings of the Danes. So much, indeed, is this the case, that every antiquity which cannot be ascribed to the Romans, is popularly thought to be Danish, an idea which has been implicitly adopted by a great number of the Scotch clergy in the Statistical Account of their respective parishes. In the Highlands, Mr Worsaae found the people retaining a very fresh recollection of the terrors of the Northmen, and ready to believe that their incursions might yet be renewed. 'Having employed myself,' he says, 'in examining, among other things, the many so-called "Danish" or Pictish towers on the west and north-west coast of Sutherland, the common people were led to believe, that the Danes wished to regain possession of the country, and with that view intended to rebuild the ruined castles on the coasts. The report spread very rapidly, and was soon magnified into the news, that the Danish fleet was lying outside the sunken rocks near the shore, and that I was merely sent beforehand to survey the country round about; nay, that I was actually the Danish king's son himself, and had secretly landed. This report, which preceded me very rapidly, had, among other effects, that of making the poorer classes avoid, with the greatest care, mentioning any traditions connected with defeats of the Danes, and especially with the killing of any Dane in the district, lest they should occasion a sanguinary vengeance when the Danish army landed. Their fears were carried so far, that my guide was often stopped by the natives, who earnestly requested him, in Gaelic, not to lend a helping-hand to the enemies of the country by shewing them the way; nor would they let him go, till he distinctly assured them that I was in possession of maps correctly indicating old castles in the district which he himself had not previously known. This, of course, did not contribute to allay their fears; and it is literally true, that in several of the Gaelic villages, particularly near the firths of Loch Inver and Kyle-Sku, we saw on our departure old folks wring their hands in despair at the thought of the terrible misfortunes which the Danes would now bring on their hitherto peaceful country.'

We have here been obliged wholly to overlook Mr Worsaae's curious chapters about Ireland and the Isle of Man, and to give what we cannot but feel to be a very superficial view of the contents of his book generally; but our readers have seen enough to inspire them with an interest in it, and we trust that this will lead many of them to its entire perusal.

CHILDREN OF PRISONS.

When I was in Berlin, I went into the public prison, and visited every part of the establishment. At last I was introduced to a very large hall, which was full of children, with their books and teachers, and having the appearance of a Prussian school-room. 'What!' said I, 'is it possible that all these children are imprisoned here for crime?' 'O no,' said my conductor, smiling at my simplicity; 'but if a parent is imprisoned for

crime, and on that account his children are left destitute of the means of education, and are liable to grow up in ignorance and crime, the government places them here, and maintains and educates them for useful employment.' This was a new idea to me. I know not that it has ever been suggested in the United States; but surely it is the duty of government, as well as its highest interest, when a man is paying the penalties of his crime in a public prison, to see that his unoffending children are not left to suffer and inherit their father's vices. Surely it would be better for the child, and cheaper as well as better for the state. Let it not be supposed that a man will go to prison for the sake of having his children taken care of; for those who go to prison, usually have little regard for their children. If they had, discipline like that of the Berlin prison would soon sicken them of such a bargain.—*Professor Stone.*

JUPITER, AN EVENING STAR.

RULER and hero, shining in the west
With great bright eye,
Rain down thy luminous arrows in this breast
With influence calm and high,
And speak to me of many things gone by.

Rememberest thou—'tis years since, wandering star—
Those eyes in June,
When thou hung'st quivering o'er the tree-tops far,
Where, with discordant tune,
Many-tongued rooks hailed the red-rising moon!

Some watched thee then with human eyes like mine,
Whose boundless gaze
May now pierce on from orb to orb divine
Up to the Triune blaze
Of glory—nor be dazzled by its rays.

All things they know, whose wisdom seemed obscure;
They, sometime blamed,
Hold our best purities as things impure:
Their star-glance downward aimed,
Makes our most lamp-like deeds grow pale and shamed.

Their star-glance!—What if through those rays there
gleam
Immortal eyes
Down to this dark? What if these thoughts, that seem
Unbidden to arise,
Be souls with my soul talking from the skies!

I know not. Yet awhile, and I shall know!—
Thou, to thy place
Slow journeying back, there startlingly to shew
Thy orb in liquid space,
Like a familiar death-lost angel face—

O planet! thou hast blotted out whole years
Of life's dull round;
The Abel-voice of heart's-blood and of tears
Sinks dumb into the ground,
And the green grass waves on with lulling sound.

GRATUITOUS SERVICES.

Never let people work for you *gratis*. Two years ago, a man carried a bundle for us to Boston, and we have been lending him two shillings a week ever since.—*American paper.*

Printed and Published by W. and R. CHAMBERS, High Street, Edinburgh. Also sold by W. S. ORR, Amen Corner, London; D. N. CHAMBERS, 35 West Nile Street, Glasgow; and J. M'GLENNAN, 50 Upper Sackville Street, Dublin.—Advertisements for Monthly Parts are requested to be sent to MAXWELL & Co., 31 Nicholas Lane, Lombard Street, London, to whom all applications respecting their insertion must be made.

PRICE 1½d.

THE MUSICAL SEASON.

'The English are not a musical people.' The dictum long stood unquestioned, and, in general estimation, unquestionable. All the world had agreed upon it. There could be no two opinions: we had no national airs; no national taste; no national appreciation of sweet sounds; musically, we were blocks! At length, however, the creed began to be called in question—were we so very insensible? If so, considering the amount of music actually listened to every year in London and the provinces, we were strangely given to an amusement which yielded us no pleasure; we were continually imposing on ourselves the direst and dreariest of tasks; we were tormenting ourselves with symphonies, and lacerating our patience with sonatas and rondos. What was the motive? Hypocrisy was very generally assigned. We only affected to love music. It was intellectual, spiritual, in all respects creditable to our moral nature, to be able to appreciate Mozart and Beethoven, and so we set up for connoisseurs, and martyred ourselves that Europe might think us musical. Is there more truth in this theory than the other? Hypocrisy is not generally so lasting as the musical fervour has proved itself to be. A fashion is the affair of a season; a mania goes as it came; but regularly and steadily, for many years back, has musical appreciation been progressing, and as regularly have the opportunities for hearing good music of all kinds been extending.

Take up a daily newspaper, published any time between April and August, and range your eye down the third or fourth column of the first page—what an endless array of announcements of music, vocal and instrumental! Music for the classicists; music for the crowd; symphonies and sonatas; ballads and polkas; harmonic societies; choral societies; melodists' clubs; glee clubs; madrigal clubs. Here you have the quiet announcement of a quartett-party; next to it, the advertisement of one of the Philharmonic Societies—the giants of the musical world; pianoforte teachers announce one of their series of classic performances; great instrumental soloists have each a concert for the special behoof and glorification of the *bénéficiaire*. Mr So-and-so's grand annual concert jostles Miss So-and-so's annual benefit concert. There are Monday concerts, and Wednesday concerts, and Saturday concerts; there are weekly concerts, fortnightly concerts, and monthly concerts; there are concerts for charities, and concerts for benefits; there are grand morning concerts, and grand evening concerts; there are *matinées musicales*, and *soirées musicales*; there are meetings, and unions, and circles, and associations—all of them

for the performance of some sort of music. There are musical entertainments by the score: in the City; in the suburbs; at every institute and hall of science, from one end of London to the other. One professor has a ballad entertainment; a second announces a lecture, with musical illustrations; a third applies himself to national melodies. All London seems vocal and instrumental. Every dead wall is covered with flaming *affiches*, announcing in long array the vast army of vocal and instrumental talent which is to assist at such and such a morning performance; and the eyes of the owner of a vast musical stomach are dazzled and delighted by programmes which will at least demand five hours in the performance.

So is London, in the course of the season, the congress of nearly all the performing musical notabilities of Europe. Time has been when they came to London for cash, not renown; now they come for both. A London reputation is beginning to rival a Parisian vogue, besides being ten times more profitable; and, accordingly, from every musical corner in Christendom, phenomena of art pour in, heralded by the utmost possible amount of puffing, and equally anxious to secure English gold and a London reputation. It is strange to observe how universally the musical tribute is paid. A tenor turns up from some Russian provincial town; a basso works himself to London from a theatre in Constantinople; rumours arrive of a peerless prima donna, with a voice which is to outstrip everything ever heard of, who has been dug out, by some travelling amateur, from her native obscurity in a Spanish or Norwegian village; an extraordinary soprano has been discovered in Alexandria; a wondrous contralto has been fished up from Riga. The instrumental phenomena are not one whit scarcer. Classical pianists pour in from Germany principally; popular pianists, who delight in fantasias rather than concertos, and who play such tricks with the key-boards, that the performances have much more of the character of legerdemain than of art, arrive by scores; violinists, violoncellists, professors of the trombone, of the ophicleide, of the bassoon, of every unwieldy and unmanageable instrument in fact, are particularly abundant; and perhaps the most popular of all are the particularly clever gentlemen who, by dint of a dozen years' or so unremitting practice, have succeeded in making one instrument sound like another. Quackery as this is, it is enormously run after by no small proportion of the public. Not that they do not appreciate the art of the device at its proper level, but that the trick is curious and novel; and most people, even the dignified classicists, have a gentle toleration for a little—just a little—*outré* amusement of the kind in

question. Paganini was the founder of this school. He might have played on four strings till he was tired, without causing any particular sensation; but the single string made his fortune. Sivori is one of the cleverest artists of the present day, who resorts to tricks with his violin, and wonderfully does he perform them. At a concert last season, he imitated the singing of a bird with the strangest and happiest skill. The 'severe' shook their heads, but smiled as they did so, and owned that the trick was clever enough, and withal agreeable to hear. But it is gentlemen who make one instrument produce the sounds of another, or, at all events, who extract from it some previously unknown effect, who carry all before them. The present phenomenon in this way is Bottesini, who, grasping a huge double-bass, the most unwieldy of instruments, tortures out of it the notes of a violin, of an oboe, and of a flute. A season or two ago, M. Vivier took all London by storm, by producing a chord upon the French horn, a feat previously considered impossible, and probably only the fruit of the most determined and energetic practice, extending over many years. At all the popular concerts, this trick-music is in immense request. Bottesini was the lion of Jullien's last series; but in his place in the orchestra of the Philharmonic, he plays his part and holds his instrument like any ordinary performer. Bagpipe music is not much appreciated on the banks of the Thames; but I can assure any enterprising Scotsman, that if he can only succeed in producing the notes of the bagpipe out of the trombone, he will make a fortune in five seasons or less.

Such is musical London, then—rushing from concert to concert, and opera to opera—from severe classicism to the most miscellaneous *omnium gatherum*—from solemn ecclesiastical harmonic assemblages to the chanting of merry glees, and the warbling of sentimental ballads. Let us, then, contemplate a little closer the different kinds of concerts—their features and their character—their performers and their audiences. Our sketch must be very hurried and very vague, but it will give an idea of some of the principal characteristics of the London musical season.

First, then, among the performances of mingled vocal and instrumental music, stand the two Sacred Harmonic Societies, which execute oratorios and similar works in Exeter Hall. The original Sacred Harmonic Society has within the last couple of years split into two bodies. It had long contained within itself the elements of division. There were the Go-ahead party and the Conservative party—the first, eager to try new ground, and aim at new effects; the second, lovers of the beaten way. At length, the split took place. The progressists flung themselves into the arms of M. Costa, the famous conductor of the Royal Italian Opera orchestra, and the highest and most Napoleonic of musical commanders. The Tories of the society went peaceably on in the jog-trot ways of Mr Sarman, the original conductor. Each society can now bring into the field about 800 vocal performers, the immense majority of them amateurs, and their concerts take place alternately—Exeter Hall being invariably crammed upon either occasion. The Costaites, no doubt, have the *pas*. The discipline of their chief is perfect, and as rigid as it is excellent. The power which this gentleman possesses over his musical troops is very curious. The whole mass of performers seem to wait upon his will as the spirits did on Prospero. At the spreading of his arms, the music dies away to the most faintly-whispered murmurs. A crescendo or musical climax works gradually up step by step, and bar by bar, until it explodes in a perfect crash of vocal and instrumental tempest. The extraordinary choral effects produced in the performance of the *Fuguenots* almost bewildered the hearers; and the wondrous lights and shades of sound given in many of the oratorios, are

little behind the dramatic achievement. The aspect of Exeter Hall on an oratorio night is one of the grandest things in London. The vastness of the assemblage, the great mountain of performers, created by the organ, and rising almost to the ceiling, are thoroughly impressive, while the first burst of the opening chorus is grand in the extreme. The oratorio is, in fact, the Opera of the 'serious' world. It is at once a place in which to listen to music and a point of social reunion. There are oratorio *habitués* as well as Opera *habitués*; and between the parts of the performance, the same buzzing hum of converse rises from the assemblage which you hear in the Opera corridors and lobbies. A glance at the audience will enlighten you as to their character. They represent the staid respectability of the middle class. The dresses of the ladies are often rich, seldom brilliant, and there is little sparkle of jewellery. You very frequently perceive family parties, under the care of a grave *pater familias* and his staid and stately partner. Quakers abound; and the number of ecclesiastically-cut coats shews how many clergymen of the church are present. The audience are in the highest degree attentive. The rules forbid applause, but a gentle murmur of admiration rises at the close of almost every *morceau*. Here and there, you have a practical amateur, or a group of such with the open score of the oratorio before them, eagerly following the music. Often these last gentlemen are members of the rival Society, and, as might be expected, pick plenty of holes in the execution of their opponents, for which charitable purpose only they have probably attended. But in M. Costa's Society, at all events, the task is difficult; the orchestra 'goes,' as the phrase is, like one instrument, and the singers are beautifully under the control of the master-spirit who directs them.

Let us pass from Exeter Hall to Hanover Square. Here, in the Queen's Concert Room—a *salle* which once was smart, and the decorations of which were fashionable seventy years ago—we have unnumbered concerts, and chief among them the twelve annual performances of the Philharmonic Society. The 'Philharmonic,' as it is conversationally called, holds almost the rank of a national institution. The sovereign patronises it in an especial manner. It is connected with the Royal Academy of Music, and Her Majesty's private band is recruited from the ranks of its orchestra. The Philharmonic band may be indeed taken as the representative of the nation's musical executive powers; and, as such, comparisons are often instituted between it and the French, Austrian, and Prussian Philharmonics. The foreigners who hold places in the orchestra are resident, and in some sort naturalised, but the bulk of the executants are English. To be a member of the Philharmonic orchestra is, indeed, to take a sort of degree in executive music, and at once stamps the individual as a performer of distinguished merit. The music performed is entirely classic, and principally instrumental. New compositions are seldom given; and, in fact, it was the practice of adhering so exclusively to the standard works of great composers which started the new Philharmonic Society, which has just come into existence. The elder body stick stanchly to the safe courses of Bach, Gluck, Beethoven, Mozart, and Mendelssohn. The newly-created association proclaim that their mission is to look after aspirants, as well as to honour the veterans of the art; and accordingly they bring forward many compositions experimentally—a meritorious policy, but one not without its dangers. Few unprofessional people are aware of the cost of producing elaborate compositions. When *William Tell* was played some years ago at Drury Lane—to mention one single item—the price of copying the parts from the full score, at 8d. a page, came to L.350. All the old music is of course to be had printed; and to these standard scores the steady-going Philharmonic principally devotes

itself. Each performance consists in general of two symphonies, or a symphony and an elaborate concerto, each occupying at least three-quarters of an hour, with two overtures, and solos, vocal and instrumental—the former generally sung by performers from either Opera, but usually from Covent Garden. M. Costa wields the baton at Hanover Square as at Exeter Hall; and under his management, the band have attained a magnificent precision and *ensemble* of effect. Its musical peculiarity over ordinary orchestras is the vast strength of stringed instruments, which gives a peculiar *verve* and light vigour to the performances. The rush of the violins in a rapid passage is overwhelming in its impetuosity and vigour, and is said, of late years especially, to beat the 'attack,' as it is technically called, of any of the continental Philharmonic Societies. The Philharmonic concerts are very fashionable. It is good taste, socially and artistically, to be present; and, consequently, the room is always crowded by an assemblage who display most of the characteristics of an Opera audience. The musical notabilities of town always muster in full force at the Philharmonic. Composers, executants, critics, amateurs, and connoisseurs, are all there, watching with the greatest care the execution of those famous works, the great effect of which can only be produced by the most wary and appreciative tenderness of rendering. In the interval between the first and second parts, the very general hum of conversation announces how great the degree of familiarity subsisting among the *habitués*. There is none of the common stiffness of waiting one sees at ordinary entertainments. Everybody seems to know everybody else, and one general atmosphere of genial intercourse prevails throughout the room.

Let us change the scene to a classic concert of quite another kind. In a quiet West-end street, we are in a room of singular construction. It is in the form of a right-angled triangle; and at the right angle, upon a small dais, is placed the pianoforte and the desks, and so forth, for the performers. The latter are thus visible from all points; but about one-half the audience in each angle of the room is quite hidden from the other. Everybody is in evening dress; the ladies very gay, and the party very quiet—a still, drawing-room sort of air presides over the whole. Many of the ladies are young—quite girls; and a good many of the gentlemen are solemn old foggies, who appear strongly inclined to go to sleep, and, in fact, sometimes do. Meantime, the music goes on. A long, long sonata or concerto—piano and violin, or piano, violin, and violoncello—is listened to in profound silence, with a low murmur of applause at the end of each movement. Then perhaps comes a little vocalism—sternly classic though—an aria from Gluck, or a solemn and pathetic song from Mendelssohn: the performer being either a well-known concert-singer, or a young lady—very nervous and a little uncertain—who, it is whispered, is 'an Academy girl,' a pupil, that is, of the institution in question. Sometimes, but not often—for it is *de rigueur* that entertainments of this species shall be severely classic—we have a phenomenon of execution upon some out-of-the-way instrument, who performs certain miracles with springs or tubes, and in some degree wakens up the company, who, however, not unfrequently relapse into all their solemn primness, under a concerto manuscript, or a trio manuscript, the composition of the *bénéficiaire*. Between the parts, people go quietly into a room beneath, where there are generally some mild prints to be turned over, some mild coffee to drink, some mild conversation about mild things in general; and then the party remount the stairs, and mildly listen to more mild music. This is the common routine of a classical pianoforte soirée. The *bénéficiaire* is a fashionable teacher, and, in a small way, a composer. He gives, every season, a series, perhaps two or three series, of classic evenings. The pupils and their families form

the majority of the audience, interspersed with a few pianoforte amateurs, and those *fanatici per la musica* who are to be found wherever a violin is tuned, or a piano is opened.

Another species of classic concert is to be found in the quartett-meetings. These take place in some small concert-room, such as that I have described, or at the houses of the executants; and the audience comprehends a far larger proportion of gentlemen than the last-mentioned entertainments. The performers are four—pretty sure to be gentlemen of the highest professional abilities. The instruments are first and second violin, viola, and violoncello; and three or four quartetts by the great masters, or, very probably, as many compositions, marking the different stages of Beethoven's imagination, are played with the most consummate skill and the tenderest regard for light and shade. People not deep in the sympathies and tastes of the musical world, have no idea how these compositions are loved and studied by the real disciples of Mozart, Beethoven, and Haydn; how particular passages are watched for; and how old gentlemen nod their heads, or shake them at each other, according as they agree or disagree in the manner of the interpretation. Half the audience probably know every bar of the music by heart, and no inconsiderable number could perhaps perform it very decently themselves. It is indeed at these quartett and quintett meetings, that you see genuine specimens of musical knowledge and musical enthusiasm. They take place by half-dozens during the season; and you always find the same class of audience, often the same individuals, regularly ranged before the executants.

But place now for the real grand, miscellaneous, popular, and populous morning concert! Now for elephantine dimensions and leviathan bills of fare. It is nominally, perhaps, or really, perhaps, the annual benefit concert of some well-known performer, or it is the speculation of a great musical publishing house, in the name of one of their composing or performing *protégés*. The latter is, indeed, a very common practice. But whether the music-publishing and opera-box-letting firm be the real concert-giver, or merely the agent, to it is left the whole of the nice operation of 'getting up' the entertainment. It has then exhausted all the dodges of puffery in pumping up an unusual degree of excitement. The affair is to be a 'festival' or a 'jubilee'; 'all the musical talent' of London is to be concentrated; the continent has been dragged for extra-ordinary executive attractions; every musical hit of the season is to be repeated; every effect is to be got up with new *éclat*: never was there to be such a *super extra, ne plus ultra* musical triumph. The day approaches. Rainbow-hued *affiches* have done their best; placard-bearers, by scores, have paraded, and are parading, the streets; advertisements have blazoned the scheme day after day, and week after week; the gratis-tickets have been duly 'planted'; puffs, oblique and implied, have hinted at the coming attraction in every Sunday paper; and programmes are fluttering in every get-at-able shop-front. The day comes. A long line of fashionable carriages, strangely intermingled with shabby cabs, file up to the doors, and the gay morning dresses, flaunting with colours, disappear between the two colossal placards which grace the entrance. The room is filled. *Habitués*, and knowing musical men on town, recognise each other, and congregate in groups, laughingly comparing notes upon the probabilities of what artists announced will make an appearance, and upon what apologies will be offered in lieu of those who don't. A couple of these last are probably already in circulation. Madame Sopranini is confined to bed with an inflammatory attack; and Signor Bassinini has got bronchitis. Nevertheless, the concert begins; and oh! the length thereof. The principal vocalists seem to have mostly mistaken the

time at which they would be wanted; and the chopping and changing of the programme are bewildering. Bravuras take the place of concertos; a duet being missing, an aria closes the ranks; a solo on the trombone not being forthcoming, a vocal trio (unaccompanied) is hurriedly substituted. Still, there is plenty of the originally announced music; all the favourite airs, duets, and trios from the fashionable operas; all the ballads in vogue—the music published by the house which has set the whole thing on foot, of course; all the phenomena of executive brilliance are there, or are momentarily expected to appear. We begin after an overture with, say, an air from the *Puritani*, by a lovely tenor; another, from the *Somnambula*, by a charming soprano; a fantasia by a legerdemain pianist, with long hair, and who comes down on the key-board as though it was his enemy; the famous song from *Figaro*—encored; the madrigal, 'Down in a Flowery Vale'—the latter always a sure card; a duet from *Semiramide*, by two young ladies—rather shaky; solo on the clarinet, by a gentleman who makes the instrument sound like a fiddle—great applause; 'In manly Worth,' by an oratorio tenor; the overture to *Masaniello*, by the band; concerto (posthumous, Beethoven), by a stern classical man—audience yawn; pot pourri, by a romantic practitioner—audience waken up; ballad, 'When Hearts are torn by manly Vows,' by an English tenor—great delight, and encouragement of native talent; glee, 'Glorious Apollo,' or, 'The Red-cross Knight'—very well received; recitative and aria, from *Lucia di Lammermoor*—very lachrymose; violin solo, by Signor Rosinif, who throws the audience into a paroxysm of delight by imitating a saw and a grindstone; 'The Bay of Biscay,' by the 'veteran' Braham, being positively his last appearance (the 'veteran' is announced for four concerts in the ensuing week!); ballad, again, by the native tenor, 'When Vows are torn by slumbering Hearts'—more great applause; the page's song from the *Huguenots*, for the contralto; 'When the Heart of a Man,' *Beggars' Opera*; quartett for four pianofortes, great bustle arranging them, and then only three performers forthcoming—an apology—attack of bronchitis—but Mr Braham will kindly (thunders of applause) sing 'The Death of Nelson'; quartett for double-bass, trombone, drum, and triangles—curious effect; the audience hardly know whether they like it or not; the bravura song of the 'Queen of Night,' from *Zauberflöte*; overture to *William Tell*; ballad, 'When Slumber's Heart is torn by Vows'; duet, 'I know a Bank,' by the *Semiramide* young ladies; fantasia pianoforte, from the *Fille du Régiment*; 'Rodo's air, with variations,' from the text; and the storm movement of the *Sinfonia Pastorale*, by Beethoven!

Such may be taken as a fair specimen-slice of a *Concert Monstre*; and in listening to this wild agglomeration of chaotic music, the day passes, very likely from two o'clock until six. In a future paper, I may touch upon the peculiarities of the artists performing.

A. B. R.

THE TALLOW-TREE OF CHINA.

It is one happy recommendation of the Natural system of botany, that many of its orders form groups of plants distinguished not only by the characteristics of general physiognomy, and the more accurate differences of structure, but in an especial manner by the medicinal and economical properties which they possess, and which are indeed frequently peculiar to the order. Such is the case with the natural order *Euphorbiaceæ*, or spurge family, to which the tallow-tree of China belongs. The order includes 2500 species, all of which are more or less acrid and poisonous, these properties being especially developed in the milky juices which abound in the plants, and which are contained,

not in its ordinary tissues, but in certain special vessels. Many important substances are derived from this order, notwithstanding its acrid and poisonous character. Castor-oil is obtained from the seeds of *Ricinus communis*; croton-oil, and several other oleaginous products of importance in medicine and the arts, are obtained from plants belonging to the order. The root of *Janipha Manihot*, or Manioc-plant, contains a poisonous substance, supposed to be hydrocyanic acid, along with which there is a considerable proportion of starch. The poisonous matter is removed by roasting and washing, and the starch thus obtained is formed into the cassava-bread of tropical countries, and is also occasionally imported into Europe as Brazilian arrow-root.

Many of the important economical productions of China are little known in this country; we are, however, daily gaining additions to our knowledge of them; and within the last few years, much valuable information has been obtained respecting the productive resources of the Eastern Empire. The grass-cloth of China only became known in Europe a few years ago, but it now ranks as one of the important fabrics of British manufacture. Daily discoveries seem to shew that there are Chinese products of equal importance, as yet unknown to us. On the present occasion, we call the attention of our readers to a substance which has been long known, as well as the plant which produces it, but neither of which has hitherto been prominently brought into general notice in Britain. For our information respecting the uses of the tallow-tree, we express our chief obligations to a paper by Dr D. J. Macgowan, published in the Journal of the Agricultural and Horticultural Society of India.*

The tallow-tree of China is the *Stillingia sebifera* of botanists; a plant originally indigenous to China, where it occurs in wet situations, but which is now somewhat common in various parts of India and America, chiefly as an ornamental tree. In Roxburgh's time, it was very common about Calcutta, where, in the course of a few years, it became one of the most common trees; and it has become almost naturalised in the maritime parts of South Carolina. In China alone, however, is it as yet appreciated as an economical plant, and there alone are its products properly elaborated. It is chiefly prized for the fatty matter which it yields, and from which it derives its appropriate name; but it affords other products of value: 'its leaves are employed as a black dye; its wood being hard and durable, may be easily used for printing-blocks and various other articles; and, finally, the refuse of the nut is employed as fuel and manure. . . . It grows aliko on low alluvial plains and on granite hills, on the rich mould at the margin of canals, and on the sandy sea-beach. The sandy estuary of Hangchan yields little else; some of the trees at this place are known to be several hundred years old, and though prostrated, still send forth branches and bear fruit. . . . They are seldom planted where anything else can be conveniently cultivated—but in detached places, in corners about houses, roads, canals, and fields.'

The sebaceous matter, or vegetable tallow, is contained in the seed-vessels of the *Stillingia*. The

* 'Uses of the *Stillingia Sebifera*, or Tallow-Tree, &c., by Dr D. J. Macgowan, M.D., &c.' The substance of the same communication was laid before the Botanical Society of Edinburgh, 12th February, 1838, having been communicated by Dr Coldstream.

processes adopted for abstracting it are of importance, and meet with due consideration in Dr Macgowan's valuable paper. The following clear account is given of the whole process, as practised in China:—'In mid-winter, when the nuts are ripe, they are cut off with their twigs by a sharp crescentic knife, attached to the extremity of a long pole, which is held in the hand, and pushed upwards against the twigs, removing at the same time such as are fruitless. The capsules are gently pounded in a mortar, to loosen the seeds from their shells, from which they are separated by sifting. To facilitate the separation of the white sebaceous matter enveloping the seeds, they are steamed in tubs, having convex open wicker bottoms, placed over caldrons of boiling water. When thoroughly heated, they are reduced to a mash in the mortar, and thence transferred to bamboo sieves, kept at a uniform temperature over hot ashes. A single operation does not suffice to deprive them of all their tallow; the steaming and sifting are therefore repeated. The article thus procured becomes a solid mass on falling through the sieve; and to purify it, it is melted and formed into cakes for the press. These receive their form from bamboo hoops, a foot in diameter, and three inches deep, which are laid on the ground over a little straw. On being filled with the hot liquid, the ends of the straw beneath are drawn up and spread over the top; and when of sufficient consistence, are placed with their rings in the press. This apparatus, which is of the rudest description, is constructed of two large beams, placed horizontally so as to form a trough capable of containing about fifty of the rings with their sebaceous cakes; at one end it is closed, and at the other adapted for receiving wedges, which are successively driven into it by ponderous sledge-hammers, wielded by athletic men. The tallow oozes in a melted state into a receptacle below, where it cools. It is again melted, and poured into tubs, smeared with mud, to prevent its adhering. It is now marketable, in masses of about eighty pounds each—hard, brittle, white, opaque, tasteless, and without the odour of animal tallow; under high pressure, it scarcely stains bibulous paper, and it melts at 104 degrees Fahrenheit. It may be regarded as nearly pure stearine. . . . The seeds yield about 8 per cent. of tallow, which sells for about five cents per pound.'

There is a separate process for pressing the oil, which is carried on at the same time. The kernels yield about 30 per cent. of oil, which answers well for lamps. It is also employed for various purposes in the arts, and has a place in the Chinese pharmacopoeia, because of its quality of changing gray hair to black, and other imaginary virtues.

The husks are used to feed the furnaces; the residuary tallow-cakes are also employed for fuel—a small quantity remaining ignited a whole day. The oil-cake forms a valuable manure, and is of course carefully used for this purpose in China, where so very great regard is paid to the collecting of manures. This kind is particularly used for enriching tobacco-fields, its powerful qualities recommending it for such a scouring crop.

With regard to the uses of the vegetable tallow, Dr Macgowan observes: 'Artificial illumination in China is generally procured by vegetable oils, but candles are also employed. . . . In religious ceremonies, no other material is used. As no one ventures out after dark without a lantern, and as the gods cannot be acceptably worshipped without candles, the quantity consumed is very great. With an unimportant exception, the candles are always made of what I beg to designate as vegetable stearine. When the candles, which are made by dipping, are of the required diameter, they receive a final dip into a mixture of the same material and insect-wax, by which their consistency is preserved in the hottest weather. They

are generally coloured red, which is done by throwing a minute quantity of alkanet-root (*Anchusa tinctoria*), brought from Shan-tung, into the mixture. Verdigris is sometimes employed to dye them green.' We are not aware that the vegetable tallow has as yet been imported into Britain to any extent.

THE TOLLMAN'S STORY.

SOME local travellers of about twenty-five years' practice, may still remember the keeper of a toll-bar on one of the western approaches to Glasgow, known in his neighbourhood as English John. The prefix was given, I believe, in honour of his dialect, which was remarkably pure and polished for one of his station in those days; and the solution of that problem was, that he had been from childhood, till the gray was thickening on his hair, in the service of an English family, who had come into possession, and constantly resided on, a handsome estate in his native parish in Dumbartonshire.

Through their interest, he had been appointed to the office of power and trust in which I made his acquaintance. John was one of my earliest friends, though the remnant of his name was never heard nor inquired after by me. The great town has now grown much nearer his toll-house, which then stood alone on the country road, with no building in sight but the school, at which I, and some two score of the surrounding juveniles, were supposed to be trained in wisdom's ways, by the elder brother of our parish minister. A painstaking, kindly teacher he was; but the toll-house was a haunt more pleasant to our young fancies than his seminary. John was the general friend and confidant of all the boys; he settled our disputes, made the best tops and balls for us, taught us a variety of new tricks in play, and sometimes bestowed upon us good advices, which were much sooner forgotten. John never married. He had a conviction, which was occasionally avowed, that all women were troublesome; and whether this evidence be considered *pro* or *con*, he was a man of rough sense and rustic piety, of a most fearless, and, what the Germans call, a self-standing nature—for solitude or society came all alike to John. You would as soon expect a pine-tree to be out of sorts, as his hard, honest face, and muscular frame. John was never sick, or disturbed in any way; he performed his own domestic duties with a neatness and regularity known to few housekeepers, and was a faithful and most uncompromising guardian of the toll-bar. I well remember how our young imaginations were impressed with the fact, that no man could pass, without, as it were, paying tribute to him; and George IV., though he appeared on the coppers with which we bought apples, cast by no means so mighty a shadow on our minds as English John. Before this glory waned, I was removed from his neighbourhood, being sent to cheer the heart and secure the legacy of a certain uncle who was a writer to the Signet in Edinburgh, and believed to be in profitable practice and confirmed bachelorhood. The worthy man has long ago married his landlady's daughter, and been blessed with a family sufficient to fill a church-pew. My own adventures—how I grew from garment to garment, how I became a law-student, and at length a writer myself—have little to do with the present narrative, and are therefore spared the reader in detail; but the first startling intelligence I received from home was, that English John had resigned his important office at the toll-house, and gone, nobody knew whither!

Years had passed; my professional studies were finished, and I had occasion to visit a Fife laird near the East Neuk. The gentleman was notable for his

taste in kitchen-gardening; and having a particularly fine bed of Jerusalem artichokes which I must see, he conducted me to the scene of his triumphs, when, hard at work with the rake and hoe, whom should I find as the much esteemed gardener, but my old friend English John! His hair had grown quite gray, and his look strangely grave, since last I saw him: time had altered me still more; nevertheless, John knew me at once—he had always a keen eye—but I perceived it was his wish not to be recognised at all in presence of the laird. That worthy was one of those active spirits who extend their superintendence to every department. He commanded in the pantry as well as on the farm; and while expatiating over the artichokes, a private message from his lady summoned him back to the house, as I sincerely believe, on some matter connected with the dinner; and he left me, with an understood permission to admire the artichokes, and the garden in general, as long as I pleased. Scarcely was he fairly out of sight, till I was at the gardener's side. 'John, my old fellow,' cried I, grasping his hand, 'I'm glad to see you once again. How has the world behaved to you these many years?'

'Pretty well, Master Willie,' said John, heartily returning my shake; 'and I'm glad to see you too; but your memory must be uncommon good, for many a one of the boys has passed me by on street and highway. How have they all turned out?' And he commenced a series of inquiries after schoolmates and old neighbours, to which my answers were as usual in such cases—some were dead, some were married, and some gone far away.

'But, John,' said I at last, determined to make out the mystery which had so long puzzled me and the entire parish—'in exchange for all my news, tell me why you left the toll-house? It was surely a better place than this?'

'You know what the old proverb says, Master Willie: "Change is lightsome,"' said John, beginning to dig, as if he would fain stave off the explanation.

'Ha, John, that won't do!' said I; 'your mind was never so unsteady. Tell me the truth, for old times' sake; and if there is anything in the story that should not be made public, you know I was always a capital secret-keeper. Maybe it was a love-matter, John: are you married yet?'

'No, Master Willie,' cried my old friend, with a look of the most sincere self-gratulation I ever saw. 'But it's a queer story, and one I shouldn't care for telling; only, you were always a discreet boy, and it rather presses on my mind at times. The master won't be back for awhile; he'll have the roast to try, and the pudding to taste—not to talk of seeing the table laid out, for there are to be some half-dozen besides yourself to-day at dinner. That's his way, you see. And I'll tell you what took me from the toll-house—but mind, never mention it, as you would keep peace in the west country.'

This is John's story, as nearly in his own words as I can call them to mind:—

The family in whose service I was brought up lived on their estate in Dumbartonshire, which came through the mistress of the mansion, who had been heiress of entail, and a lady in her own right; we called her Lady Catherine, and a prouder woman never owned either estate or title. Her father had been a branch of the Highland family to whom the property originally belonged. Her mother was sprung from the old French nobility, an emigrant of the first Revolution, and she had been brought up in England, and married in due time to an Honourable Mr — there. When she first came to the estate, her husband had been some years dead, and Lady Catherine brought with her a son, who was to be heir—at that time a boy like

myself—and two handsome grown-up daughters. The castle was a great fabric, partly old and partly new. It stood in the midst of a noble park, with tall trees and red deer in it. Its last possessor had been a stingy old bachelor; but after Lady Catherine's coming, the housekeeping was put on a grand scale. There was a retinue of English servants, and continual company. I remember it well, for just then my poor mother died. She had been a widow, living in a low cottage hard by the park-wall, with me and a gray cat for company, and her spinning-wheel for our support. I was but a child when she died; and having neither uncle nor aunt in the parish, they took me, I think, by her ladyship's order, into the castle, to run small errands, and help in the garden; from which post, in process of time, I rose to that of footman. Lady Catherine was in great odour with the country gentry for her high-breeding, her fashionable connections, and her almost boundless hospitality. She was popular with the tenantry too, for there was not a better managed estate in the west, and the factor had general orders against distress and ejectment.

They said her ladyship had been reckoned a beauty in London drawing-rooms, and our parish thought her wonderfully grand for the gay dresses and rich jewellery she wore. Doubtless, these were but the cast-offs of the season, for regularly every spring she and the family went up to London, where they kept a fine house, and what is called the best society. How much the gay dresses had to do with the beauty is not for me to say, but Lady Catherine was a large, stately woman, with a dark complexion, and very brilliant red, which the servants whispered was laid on in old court fashion. Her manner to her equals was graceful, and to her inferiors, gracious; but there was a look of pride in her dark gray eyes, and a stern resolution about the compressed lips, which struck my childish mind with strange fear, and kept older hearts in awe. Her daughters, Florence and Agnes, were pictures of their mother—proud, gay ladies, but thought the flower of the county. Their portions were good, and they would have been co-heiresses but for their brother Arthur. He was the youngest, but so different from his mother and sisters, that you wouldn't have thought him of the same family. His fair face and clear blue eyes, his curly brown hair and merry look, had no likeness to them, though he was not a whit behind them in air or stature. At eighteen, there was not a finer lad in the shire; and he had a frank, kindly nature, which made the tenantry rejoice in the prospect of his being their future landlord.

Near the castle there stood a farmhouse, occupied by an old man whose great-grandfather had cultivated the same fields. He was not rich, but much respected by his neighbours for an honest, upright life. His wife was as old as himself. They had been always easy-living people, and had no child but one only daughter. Menie was a delicately pretty girl, a little spoiled, perhaps, in her station, for both father and mother made a queen of her at home. She was never allowed to do any rough work, was always dressed, and her neighbours said, kept in the parlour. Menie had a great many admirers, but her parents thought her too good for everybody, and had a wonderful belief of their own, that she was somehow to get a great match, and be made a lady. There was a strange truth in that notion, as things turned out, for we servants at the castle began to remark how often the young master was seen going and coming about the farmhouse. Maybe the old farmer and his wife encouraged him, for they had a story concerning their own descent from some great chief of the western Highlands, and a family of wild proud cousins, who lived up among the hills; but of this I know nothing more, only that the farmer's daughter was the prettiest girl in the parish. Master Arthur was beginning his nineteenth year, and there was a

storm up stairs, such as had never been heard before in the castle, when Lady Catherine found out what was going on, as I think through our minister, who considered it his duty to let her know what every one talked of, but nobody else would dare to mention in her presence. Whether the tempest was more than Master Arthur could stand, or whether Lady Catherine, in her fury—for she had no joke of a tongue and temper—said something of Menie which drove the boy to finish the business in his own way, was long a disputed point in the servants' hall; but next morning he was missed in the castle, and in the course of my duties the same forenoon, I brought a letter from the village post-office, the reading of which sent the young ladies off in hysterics, and made Lady Catherine retire to her room—for it announced that her heir of entail and the farmer's daughter were gone to get married in Glasgow.

The young ladies recovered in about two hours, and her ladyship came out, but only to prepare for a journey to Paris; and quick work she made of it. Within twenty-four hours from the receipt of that letter, she and her daughters were off in the family carriage; the best part of the servants despatched to live at their town-house on board-wages; all the good rooms locked up, and nobody but the gardener, a kitchen-girl, and myself left with the old housekeeper at the castle. The next news we heard was, that the old farmer and his wife had set out to bring home their daughter and son-in-law, saying—poor people, in their pride or folly—that Menie and her husband could live with them till Providence cleared their way to the estate, which nobody could keep from them. I believe it was that speech, coming to her ears by some busy tongue or other, that made Lady Catherine so bitter afterwards; but Master Arthur and his bride came home to the farmhouse, where the parlour and the best bedroom were set apart for their use; and the poor old father and mother were proud to serve and entertain them. They were a young pair; for, as I have said, he was in his nineteenth, and she in her seventeenth year—a handsome pair, too, and more alike than one would have supposed from the difference of their birth. Menie had a genteel, quiet carriage, and really looked like a lady in the church-pew beside our young master, whom we seldom saw but at a distance—for his spirit was too high to come near the castle—and though it wasn't just told us, we all knew that going to the farmhouse would be reckoned the full value of our places.

It was the fall of the year when Lady Catherine left us—all that winter she spent in Paris; and when the spring again came round, we heard of her opening house with even more than usual gaiety in London. That was a great season with her ladyship. In its course, she got her daughters both married to her mind. The one wedded a baronet, and the other a right honourable; but scarcely had the newspapers fully announced his sisters' wedding-breakfasts, and how the happy pairs set out, when Master Arthur was seized with sudden sickness. He had been fishing in a mountain-lake, and got drenched to the skin by the rain of a thunder-storm, overexerted himself in walking home, and caught a pleurisy. The whole parish felt for the poor young man, who had been so hardly used by his mother, and many were the inquiries made for him at the farmhouse. There was wild wo there, for every day he got worse; and within the week, Menie was left a widow. Lady Catherine had gone back to Paris at the close of the season; one of her married daughters was in Italy, and the other in Switzerland; but two cousins of their father were to be found in England; and Master Arthur was laid in the family vault, under our old parish church, before the intelligence reached them. Lady Catherine came back in deep mourning, and alone, but not a whit subdued in spirit: she had been heard to say, that her

son was better dead than disgraced; and her estate was at least safe from being shared by peasants. Of her daughter-in-law, she never took the slightest notice. People said, the poor young widow's heart was broken, for she had thought more of Arthur than of his rank and property, and kept well out of the proud, hard woman's way. Her ladyship did not seem to like living at the castle; she stayed only to regulate matters with the factor at Martinmas, and went back again to London. Before she went, a report began to rise, that poor Menie had drooped and pined into a real sickness. They said it was a rapid decline, and a dog would have pitied the father and mother's grief. How strangely they strove to keep that only child, asking the prayers of the congregation, and sending for the best doctors; but all was in vain, for Menie died some days before Christmas. The girl had a simple wish to rest beside Arthur. It was the last words she spoke; and her relations believed that, being his wife, she had a right to a place in the vault without asking anybody's leave. So they laid her quietly beside her husband, no one about the castle caring to interfere, except the factor, who thought it incumbent on him to let her ladyship know.

By way of answer to his letter, down came Lady Catherine herself, one dark, wintry morning; and, without so much as changing her travelling dress, she sent for four labourers, took them with her to the church, and saying her family burying-place was never intended for a peasant's daughter, made them take out Menie's coffin, and leave it at her parents' door. They said that the old pair never got over that sight; and the mother, in her bitterness of heart, declared that Providence had many a way to punish pride, and the woman who had disturbed her dead child, would never be suffered to keep her own grave in peace.

The story made a marvellous stir in our parish, and grand as Lady Catherine was, she did not escape blame from all quarters. There was a great gathering of Highland relatives and Lowland friends to a second funeral, when they laid poor Menie among her humble kindred in the church-yard. It was but a little way from the park gate, and I stood there to see the crowd scatter off in that frosty forenoon. Many a sad and angry look was cast in the direction of the castle; but my attention was particularly drawn to an old man and two boys, who stood gazing on the place. He was close on the threescore-and-ten—they were little more than children; but all three had the same gaunt, yet powerful frames; dark-red hair, which in the old man was but slightly sprinkled with gray; almost swarthy complexions; and a fierce, hard look in the deep-set eyes. By after inquiries, I learned that these were the father of the Highland cousin family, and his two youngest sons. There were three elder brothers, but they were married, and settled on rough sheep-farms; and the old man intended to maintain the ancient honours of his house, by putting his younger boys into some of the learned professions.

The married sisters, now heiresses of entail, never visited the castle again in my time. Lady Catherine came regularly at the terms from London, where she lived constantly; but her stay was no longer than the rent-roll required, and her maid said she rested but badly at night. So years passed on, and I rose in the service. On one of her visits, Lady Catherine thought I would do for a footman, which she happened to want, and sent me to be trained at the house in London. What great and gay doings I saw there needn't be told just now. Lady Catherine kept the best and most fashionable company, and she was never at home an evening that the house was not full. There was money to be made, and plenty of all things; but I did not like it; and having saved a trifle, one of her ladyship's sons-in-law—he was the best of the two—got me the place at the toll-bar.

You remember me there, Master Willie, and what great times we had on Saturday afternoons. You may recollect, too, how many foot-passengers used to come and go. It was my amusement to watch them when I had nothing better to do; but of all who passed my window, there were none took my attention so completely as two young men, who always walked arm-in-arm, and seemed to be brothers. I thought I had seen their strongly-marked Highland faces before, and by degrees learned that they were none other than the old man's two sons, who had been at poor Menie's last funeral, but were now grown up, and studying for the medical profession at the college in Glasgow. Their father evidently kept them on short allowance, judging from their coarse tartan clothes, and continual munching of oatmeal cakes: but I was told they were hard students, and particularly clever in the anatomy class. One dark, dreary morning, about the Christmas-time, I noted that Lady Catherine and her family had been in my dreams all night—their grand house, and gay goings-on in London, mingling strangely with the old story of Master Arthur and the farmer's daughter. When the newspaper, which I shared with the school-master, came, judge of my astonishment to read that her ladyship had died suddenly in a fit of apoplexy, which came upon her at the whist-table, and her remains had been conveyed to the family vault in Dumbartonshire. There was a lesson on the uncertainty of life! and it is my trust that I found in it a use of warning; but the continual news and strangers at the toll-bar, the exact gathering in of the ducs, which was not always an easy task, and your own merry school-mates, Master Willie, had in a manner shuffled it out of my mind before the second evening.

It had been a dark, foggy day, and I went early to sleep, there being few travellers; but in the dead of night, between twelve and one, I was roused by a thundering summons at the toll-bar. The night was calm and starless, a mass of heavy clouds covered the sky, broken at times by gusts of moaning wind from the west, and broad bursts of moonlight. I threw on my coat, lit my lantern, and hurried out. There stood a large gig with three persons. They must have been tightly packed in it, and I never saw a more impatient horse. There was some delay in getting out the silver, and I had time to see that the two men who sat, one on each side, were the Highland brothers. There was a woman between them, in a dingy cloak and bonnet, with a thick black veil. She neither moved nor spoke, though the toll somehow puzzled the students. I was determined to have it any way, and one of them saying something to his companion in Gaelic, reached a half-crown to me. I knew I had no change, and told him so. 'I'll call in the morning,' said he; but the horse gave a bound, and the silver flew out of his fingers. Both the brothers looked down after it. I had a strange curiosity about their companion, and that instant a gust of wind blew back the veil, and the moonlight shone clear and full upon the face: it was the dead visage of Lady Catherine! I saw but one glance of it; the next moment the heavy veil had fallen. 'Get the silver yourself, and keep it all,' cried the two men, as I opened for them without a word: and from that day to this, no one has ever heard the story from me. I put the half-crown in the poor's-box next Sabbath. But, Master Willie, after that night I never cared for keeping the toll-bar. The sound of wheels coming after dark had always a strange effect on me, and I could never see a gig pass without shivering. So I gave up my situation, and took to the old trade of gardening again. The pleasant plants and flowers bring no dark stories to one's mind. But yonder's the laird: dinner will be ready by this time.

And John was right; for it was ready, with a jovial party to despatch it. But I never saw my old friend

after. He emigrated to Canada with his managing master in the following spring; and, having at least kept the real names with enjoined secrecy, it seems at this distance of time no breach of trust to repeat the toll-keeper's story.

CARDINAL MEZZOFANTI

Among the lions of Rome during the last twenty years, not the least attractive, especially for literary visitors, was the celebrated Cardinal Mezzofanti. Easy of access to foreigners of every condition, simple, unpretending, cheerful, courteous even to familiarity, he never failed to make a most favourable impression upon his visitors; and marvellous as were the tales in circulation concerning him, the opportunity of witnessing more closely the exercise of his almost preternatural powers of language, served but to deepen the wonder with which he was regarded. The extent, the variety, and the solidity of his attainments, and, still more, his complete and ready command, for the purposes of conversation, of all the motley stores which he had laid up, were so far beyond all example, whether in ancient or modern times, as not only to place him in the very first rank of the celebrities of our generation, but to mark him out as one of the most extraordinary personages recorded in history.

Giuseppe (Joseph) Mezzofanti was born at Bologna in 1774, of an extremely humble family. His father was a poor carpenter; and the eminence to which, by his own unassisted exertions, Mezzofanti, without once leaving his native city, attained in the exercise of the faculty of language—which is ordinarily cultivated only by the arduous and expensive process of visiting and travelling in the different countries in which each separate language is spoken—is not the least remarkable of the many examples of successful 'pursuit of knowledge under difficulties,' which literary history supplies. He was educated in one of the poor schools of his native city, which was under the care of the fathers of the celebrated Congregation of the Oratory; and the evidence of more than ordinary talent which he exhibited, early attracted the notice of one of the members of the order, to whose kind instruction and patronage Mezzofanti was indebted for almost all the advantages which he afterwards enjoyed. This good man—whose name was Respighi, and to whose judicious patronage of struggling genius science is also indebted for the eminent success of the distinguished naturalist Ranzani, the son of a Bolognese barber, and a fellow-pupil of Mezzofanti—procured for his young protégé the instruction of the best masters he could discover among his friends. He himself, it is believed, taught him Latin; Greek fell to the share of Father Emmanuel da Ponte, a Spanish ex-Jesuit—the order had at this time been suppressed; and the boy received his first initiation into the great Eastern family of languages from an old Dominican, Father Ceruti, who, at the instance of his friend Respighi, undertook to teach him Hebrew. Beyond this point, Mezzofanti's knowledge of languages was almost exclusively the result of his own unassisted study.

From a very early age, he was destined for the church, and he received holy orders about the year 1797. During the period of his probationary studies, however, he obtained, through the kindness of his friend F. Respighi, the place of tutor in the family of the Marescalchi, one of the most distinguished among the

nobility of Bologna; and the opportunities for his peculiar studies afforded by the curious and valuable library to which he thus enjoyed free access, may probably have exercised a decisive influence upon his whole career.

His attainments gradually attracted the notice of his fellow-citizens. In the year 1797, he was appointed professor of Arabic in the university; a few years later, he was named assistant-librarian of the city library; and in 1803, he succeeded to the important chair of Oriental Languages. This post, which was most congenial to his tastes, he held, with one interruption, for a long series of years. In 1812, he was advanced to a higher place in the staff of the library; and in 1815, on the death of the chief librarian, Pozetti, he was appointed to fill his place. When it is considered how peculiarly engrossing the study of languages is known to be, and especially how attractive for an enthusiastic scholar like Mezzofanti, it might be supposed that for him the office of librarian could have been little more than a nominal one. But the library of Bologna to the present day bears abundant evidence that it was far otherwise. The admirable order in which the Greek and Oriental manuscripts are arranged, the excellent *catalogue raisonné* of these manuscripts, and the valuable additions to the notices of them by Assemani and Talmir which it contains, are all the fruit of Mezzofanti's labour as librarian.

During his occupancy of this office, too, he continued to hold his professorship of Oriental languages, and, for a considerable part of the time, that of Greek literature in addition. Nor was he exempt from those domestic cares and anxieties which are often the most painful drawback upon literary activity. The death of a brother, which threw upon him the care of an unprotected family of eleven children, was the severest trial sustained in Mezzofanti's otherwise comparatively quiet career; and by driving him to the ordinary expedient of distressed scholars—that of giving private lectures—it tended more than all his public occupations to trench upon his time, and to abridge his opportunities of application to his favourite study.

Perhaps, indeed, of all who have ever attained to the same eminence in any department which Mezzofanti reached in that of languages, there hardly ever was one who had so little of the mere student in his character. In the midst of these varied and distracting occupations, he was at all times most assiduous in his attendance upon the sick in the public hospitals, of which he acted as the chaplain. There was another also of his priestly duties, for the zealous discharge of which he was scarcely less distinguished, and which became subsidiary, in a very remarkable way, to his progress in the knowledge of languages. In the absence, up to the present time, of any regular memoir of him, it is impossible to fix with precision the history of his progress in the acquisition of the several languages. But it is well known, that at a very early period he was master of all the leading European languages, and of those Oriental tongues which are comprised in the Semitic family. Very early, therefore, in Mezzofanti's career, he was marked out among the entire body of the Bolognese clergy as in an especial manner the 'foreigners' confessor' (*confessario dei forestieri*). In him, visitors from every quarter of the globe had a sure and ready resource; and in several cases, it was to the very necessity thus created he was indebted for the acquisition, or at least the rudimentary knowledge, of a new language. More than once, it occurred that a foreigner, introduced to the *confessario dei forestieri*, for the purpose of being confessed, found it necessary to go through the preliminary process of instructing his intended confessor. For Mezzofanti's marvellous and almost instinctive power of grasping and systematising the leading characteristics even of the most original language, the names of a few

prominent ideas in the new idiom sufficed to open a first means of communication. His prodigious memory retained with iron tenacity every word or phrase once acquired; his power of methodising, by the very exercise, became more ready and more perfect with each new advance in the study; and, above all, a faculty which seemed peculiar to himself, and which can hardly be described as other than instinctive, of seizing and comprehending by a single effort the general outlines of the grammatical structure of a language from a few faint indications—as a comparative anatomist will build up an entire skeleton from a single bone—enabled him to overleap all the difficulties which beset the path of ordinary linguists, and to attain, almost by intuition, at least so much of the required language as enabled him to interchange thought with sufficient freedom and distinctness for the purposes of this religious observance, which is so important in the eyes of Catholics. And he used to tell, that it was in this way he acquired more than one of his varied store of languages. For it will hardly be believed, that this prodigy of the gift of tongues had never, till his forty-eighth year, travelled beyond the precincts of his native province; and that, up to the period of his death, his most distant excursion from Rome, in which city he had fixed his residence in 1832, did not exceed a hundred miles—namely, to Naples, for the purpose of visiting the Chinese College which is there established.

It is true that at the period of which we speak, Bologna lay upon the high-road to Rome, and that travellers more frequently rested for a space upon their journey, than in these days of steam-boat and railway communication. But, even then, the opportunities of intercourse with foreign-speaking visitors in Bologna were few and inconsiderable compared with the prodigious advances which, under all his disadvantages, Mezzofanti contrived to make. The ordinary European languages presented but little difficulty; the frequent passings and repassings of the allied forces during the later years of the war, afforded him a full opportunity of acquiring Russian; and the occasional establishment of Austrian troops in Bologna, brought him into contact with the motley tongues of that vast empire—the Magyar, the Czechish, the Serbian, the Walachian, and the Romani; but beyond this, even his spirit of enterprise had no vent in his native city; and all his further conquests were exclusively the result due to his own private and unassisted study.

His fame, nevertheless, began to extend to foreign countries. Among many distinguished foreigners to whose acquaintance his extraordinary faculties as a linguist became a passport, was the celebrated Russian general, Suwarow; and with him Mezzofanti long maintained the most friendly relations. From the Grand-Duke of Tuscany he received a pressing invitation to fix himself at Florence; and Napoleon himself, with that engrossing spirit which desired to make Paris the centre of all that is great in science, in art, and in literature, offered him a most honourable and lucrative appointment, on condition of his removing to the French capital. But Mezzofanti declined both the invitations, and continued to reside in his native city, till the year 1832. At the close of those political disturbances, of which Bologna was the centre, in the early part of the pontificate of Gregory XVI., it was resolved to send a deputation to Rome on the part of the citizens. Of this deputation, Mezzofanti, as the chief celebrity of the city, was naturally a leader; and the pope, who had long known him, and who, before his elevation to the pontificate, had frequently corresponded with him on philological subjects, urged him so earnestly to remain at Rome, that with all his love of Bologna he was induced to consent. He was immediately appointed, in 1832, a canon of St Peter's; and on the translation of the celebrated Angelo (now Cardinal) Mai to the office of secretary of the Propaganda, he was named to

succeed him in the honourable post of librarian of the Vatican.

In this office Mezzofanti continued till the year 1840, when, in conjunction with the distinguished scholar just named, he was raised to the cardinalate. During the interval since his fixing his residence at Rome, he had enjoyed the confidence and friendship of Gregory XVI.; and although his narrow resources were utterly unequal to the very considerable expense which the state of a cardinal entails, Gregory, in acknowledgment of his distinguished merit, himself settled the necessary income upon the humble Bolognese; and even, with characteristic delicacy, supplied from his own means the equipage and other appurtenances which a new cardinal is obliged to provide on entering upon his office.

From this period, Mezzofanti continued to reside at Rome. Far, however, from relaxing in the pursuit of his favourite study after his elevation, he only used the opportunities thus afforded for the purpose of cultivating it with more effect. When the writer of these pages first had the honour of being presented to him, he was in the full flush of the excitement of a new study—that of the language of the Californian Indians, two of whom had recently come as pupils to the College of the Propaganda; and up to his very last year, the same zeal continued unabated. His death occurred March 16, 1849, in the seventy-fifth year of his age, and was most probably hastened by the excitement and distress caused by the political troubles of the period.

Such is a brief outline of the quiet and uneventful career of this extraordinary man. It remains that we give a short account of the nature and extent of his prodigious attainments as a linguist. It is observed by the author of an interesting paper read a few weeks since at a meeting of the Philological Society, that, taking the account of the linguistic accomplishments of King Mithridates even in the most exaggerated form in which it is given by the ancients, who represent him as speaking the languages of twenty-two nations, it fades into insignificance in contrast with the known and ascertained attainments of Mezzofanti. A Russian traveller, who published in 1846 a collection of *Letters from Rome*, writes of Mezzofanti:—'Twice I have visited this remarkable man, a phenomenon as yet unparalleled in the learned world. He spoke eight languages fluently in my presence. He expressed himself in Russian very purely and correctly. Even now, in advanced life, he continues to study fresh dialects. He learned Chinese not long ago. I asked him to give me a list of all the languages and dialects in which he was able to express himself, and he sent me the name of God written with his own hand in fifty-six languages, of which thirty were European, not including their dialects; seventeen Asiatic, also without counting their dialects; five African, and four American!' We should add, however, from the cardinal's own avowal to ourselves, that of the fifty-six languages here alluded to, there were some which he did not profess to speak, and with which his acquaintance was more limited than with the rest; an avowal the honesty of which will be best appreciated when it is considered, on the one hand, how difficult it would have been to test his knowledge of the vast majority among these languages; and, on the other, how marvellously perfect was his admitted familiarity with those which he did profess really to know.

The author of the memoir submitted to the Philological Society, has collected a number of notices of Mezzofanti by travellers in Italy, who had seen him at different periods of his career. Mr Stewart Rose, in 1817, tells of him that a Smyrniote servant, who was with him, declared that he might pass for a Greek or a Turk throughout the dominions of the Grand Signior. A few years later, while he was still residing at Bologna,

he was visited by the celebrated Hungarian astronomer, Baron Zach, editor of the well-known *Correspondances Astronomiques*, on occasion of the annular eclipse which was then visible in Italy. 'This extraordinary man,' writes the baron, February 1820, 'speaks thirty-two languages, living and dead—in the manner I am going to describe. He accosted me in Hungarian, with a compliment so well - turned, and in such excellent Magyar, that I was quite taken by surprise. He afterwards spoke to me in German, at first in good Saxon, and then in the Austrian and Swabian dialects, with a correctness of accent that amazed me to the last degree, and made me burst into a fit of laughter at the thought of the contrast between the language and the appearance of this astonishing professor. He spoke English to Captain Smyth, Russian and Polish to Prince Volkonski, with the same volubility as if he had been speaking his native tongue.' As a last trial, the baron suddenly accosted him in *Walachian*, when, 'without hesitation, and without appearing to remark what an out-of-the-way dialect had been taken, away went the polyglot with equal volubility;' and Zach adds, that he even knew the Zingler or gipsy language, which had long proved a puzzle to himself. Molbech, a Danish traveller, who had an interview with him in 1820, adds to his account of this miraculous polyglotist, that 'he is not merely a linguist, but is well acquainted with literary history and bibliography, and also with the library under his charge. He is a man of the finest and most polished manners, and at the same time, of the most engaging good-nature and politeness.'

It would be easy to multiply anecdotes, shewing the enthusiasm with which Mezzofanti entered on the study of language after language. He sought out new tongues with an insatiable passion, and may be said to have never been happy but when engaged in the mastering of words and grammars. No degree of bad health interrupted his pursuit. Till the day of his death, he was engaged in his darling task: life closed on him while so occupied. He died just as he had acquired a thorough proficiency in Californian—a singular instance of the power of mind exercised on a favourite subject, and shewing what may be accomplished when men set their heart on it. The career of this remarkable linguist, however, cannot be considered exemplary. We would recommend no person to plunge headlong into an absorbing passion for any accomplishment. Mezzofanti was a curiosity—a marvel—the wonder of the world of letters; and it is chiefly as such that a notice of him here will be considered interesting.

CURIOSITIES OF POSTHUMOUS CHARITY.

THE curious observer, in his rambles about town, is occasionally struck with some singular demonstrations for which he is at a loss to account. Sometimes they assume a benevolent form, and sometimes they have a holiday-making aspect, yet with a touch of the lugubrious. In London, or in some one of the thriving towns lying within a score of miles of it, he strolls into a church, where he sees a number of loaves of bread piled up at the back of the communion-table, or ranged, as they are in a baker's shop, upon shelves against the wall. It is a pleasant sight, but apt to be somewhat puzzling. Perhaps he saunters into a country church-yard, and there finds amongst the rank grass and moss-grown and neglected memorials of the silent multitude, one trim and well-tended monument, uninvaded by cryptogamia, free from all stain of the weather, and the surrounding grassy sward neatly mown and fenced in, it may be, with budding willow branches or a circle of clipped box. Or

he finds his way through a suburban village, blocked up some fine morning by a crowd of poor women and girls, clustered round the door of a retired tradesman or the curate of the place, from which three or four at a time emerge with gratified looks, and go about their business, while others enter in their turn. Such demonstrations as these, and we might mention many others, have their origin in certain charitable dispositions and bequests, many of which are of considerable antiquity. There is one in operation to this day, near Winchester, which dates from the time of William of Wykeham; by virtue of which every traveller passing that way, if he choose to make the demand, is regaled with a pint of beer and a meal of bread and cheese. There is another similar antique charity in operation in Wiltshire, near Devizes, where, on one occasion, the dispenser of the benevolence, in the exercise of his privilege to feed the hungry, threw a loaf of bread into the carriage of George III. as the royal cortege passed the spot. The name of these post-mortem charities is legion. They abound in every city, burgh, town, and hamlet in England, to an extent absolutely startling to a person who looks into the subject for the first time. The number of them belonging to the city of London alone—that is, originating among her citizens, and mostly dispensed under the direction of the several worshipful companies—can hardly be fewer than 1500, if so few. The parochial charities only of London city yield an income of nearly L.40,000 a year. The history of all these charities would fill many bulky volumes. We propose merely to take a passing glance at a few, which are interesting from their singularity, or from the light which they reflect upon the benevolent aspect of a certain section of society in times long past; and which, perhaps, may be found in some degree instructive and suggestive, as illustrating the operation of post-mortem benevolence.

At St — Church, not a hundred miles from St Martin's Le Grand, there prevails an amusing instance of the perversion of the funds of a charity to purposes which could not possibly have been intended by the founder. Many centuries ago, a Roman Catholic gentleman, dying, bequeathed to that church a small estate, the proceeds of which he directed should be devoted to the purpose of supplying the officiating priests with refreshment on the Sabbath-day. The Roman Catholic service has long since given place to a Protestant one, and the band of officiating priests has dwindled down to one clergyman—while the value of the estate has increased perhaps fiftyfold. At the present moment, the sum which the estate originally produced is paid over to the church-wardens, who are at times a little puzzled as to what to do with it. They get rid of a good portion in this way: at every service which is held in the church, they place a bottle of the best sherry which can be procured for money upon the vestry-table; from this the 'officiating priest' strengthens his inner man with a glass or two before commencing his ministrations, and then the church-wardens sit down and finish the remainder comfortably by themselves, while the reverend gentleman is in the reading-desk or the pulpit. The cost of the wine, however, does not amount to half the sum in their hands, and the remainder goes to form a fund from which the church is painted, repaired, decorated, and kept in apple-pie order—the whole fabric undergoing a thorough revision and polish both outside and in as often as a pretext can be found.

What becomes of the bulk of the property—the large surplus arising from the increased value of the devised estate—this deponent sayeth not: the reader may be in a condition to guess by the time he has read to the end of this paper.

In the year 1565, a Mr Edward Taylor willed to the Leathersellers' Company a messuage, tenement, and melting-house, in the parish of St Olave, and other messuages in the same parish, upon condition that they should, quarterly and for ever, distribute among the poorest and neediest people in the Poultry Compter one kilderkin of beer and twelve pennyworths of bread, and the same to the poor of Wood Street Compter, Newgate, and the Fleet, the King's Bench, and the Marshalsea prisons. Under this bequest, the Company are at present in possession of considerable property, vastly increased in value since the date of the will; in respect of which property, 1s. worth of penny-loaves, and 2s. in money, in lieu of beer, are sent by them every quarter to the poor prisoners in each of the prisons mentioned in the original testament!

Robert Rogers devised in 1601 the sum of L.400 to the Leathersellers' Company, 'to be employed in lands, the best pennyworth they could get; and that the house should have 40s. of it a year for ever. The remainder was to be bestowed upon poor scholars, students of divinity—two of Oxford, and two of Cambridge, for four years; and after them to two others of each university; and after them, to others; and so on for ever. He also, by the same will, devised L.200 to be lent to four young men, merchant adventurers, at L.6, 18s. 4d., for the L.200, interest. The whole of the interest was to be spent in bread—to be distributed among poor prisoners—and coal for poor persons, with the exception of some small fees and gratuities to the parish clerk and beadle, for their trouble in carrying out his intentions. •

Lewisham, once a town in Kent, but now nothing more than a suburb of London, enjoys the benefactions of the Rev. Abraham Colfe, who, in 1656, bequeathed property for the maintenance of numerous charities. Some of them are singularly characteristic. Having provided for the erection of three strong alms-houses, he directed that certain alms-bodies should be periodically chosen, who were to be 'godly poor inhabitants of Lewisham, and being single persons, and threescore years old, past their hard bodily labour, and able to say the Lord's Prayer, the Belief, and the Ten Commandments,' &c. &c. All these alms-bodies were to have '3d. each allowed them every day for their comfortable sustenance—that is, 21d. a week—to be paid them every month during their single life, and as long as they should behave themselves honestly and godly, and duly frequent the parish church.' They were to be summarily removed if guilty of profane or wicked conduct. The alms-bodies were not to exceed five in number at any one time. He directed a buttery to be built for their convenience, and also a little brick room, with a window in it, for the five alms-bodies to assemble in daily for prayer, and that the schoolmaster of the reading-school should pray with them there. He further directed the enclosure of gardens, of sixteen feet broad at the least, for their recreation. Mr Colfe also left money for lectures at Lewisham Church, as well as a sum for the purchase of Bibles, until they should amount to the number of thirty or forty, which were to be chained to the pews, or otherwise preserved; and he left 12d. a quarter to the clerk for writing down the names of those that should use them; also 2s. 8d. to him for taking care of the clock and dial; also, 10s. for a sermon on the 5th of November, and 12d. in bread for the poor who should come and hear it, and 6d. to the parish clerk; also 20s., to be distributed a penny at a time, to the children and servants who could best say their catechism, and 6d. to the minister for catechising them; also, a yearly

sum of money for distributing on every Lord's-day after the morning service, seven penny wheaten loaves, to seven of the most honest, peaceable, and godly poor householders of Lewisham, who could say the Lord's Prayer, the Belief, and the Ten Commandments; also, 5s. a year to poor maid-servants, who at the time of their marriage had continued seven years with their master or mistress in Lewisham; with numerous other bequests. He further left moneys for the preservation of his father's, grandfather's, his wife's, and his own monument—his own being an oaken plank oiled, and a stone 'a foot square every way, and three feet long.' The stone and plank were removed many years ago, and an inscribed tablet has been set into the outer wall of the church.

The practice of leaving money for the sustentation of tomb-stones and monuments, appears to have prevailed for many generations; and may be very naturally accounted for, by the repugnance which most men would feel, to the idea of having their bones knocked about by the sexton's spade, and then wheeled off to the bone-house, if there happens to be a bone-house, or shot into the neighbouring river, or on a farmer's dung-heap, if there is no such convenience as a bone-house at hand. It was this feeling that induced the celebrated sculptor, Chantrey, to make sure of a quiet resting-place for his remains.* In so doing, he was, though perhaps unconsciously, but following the example of many who have gone before him. We have more than once encountered a sober party upon their annual visit to some country church-yard tomb, of which, by virtue of some bequest—which provides them with a good dinner upon the occasion—they are the appointed guardians. The worshipful members of the London companies sometimes choose to rest from their labours in a rural grave; and when they do, survivors are always to be found not unwilling to enjoy once a year a pensive holiday, coupled with the creature comforts, which the quiet comrade whose behest they execute has taken care to provide for them. It would be perhaps difficult to find a single church in all the little towns and hamlets within a dozen miles of London, which does not contain one tenant at least who has thus secured permanent possession of his last resting-place. So strong is this feeling in some individuals, that they shrink from confiding even in the stone-vaults in the interior of a city church. Thus, Sir William Rawlins, not so very long ago, bequeathed a certain sum of money for the preservation of his tomb and monument in Bishopsgate Church. The bequest provides for the remuneration of the visitors, who are specified parish functionaries, and entertains them with a good dinner on the day of the annual visitation, which they are bound to make—to inspect the monument and tomb, and to guarantee their good condition. In many instances, the sum originally devised for the sustentation of a grave or monument is not sufficient, in the present day, to remunerate residents in London for looking after it, and the money has been transferred to the parish in which the testator lies, and has become the perquisite of the sexton.

In the year 1635, one John Fletcher bequeathed to the Fishmongers' Company the sum of L.120, to supply 10s. every month to the poor of St Peter's Hospital, to provide them with a dinner on Sunday.

In the year 1653, Mr James Glassbrook bequeathed, after his wife's death, the sum of L.500 in the following words: 'and L.500 more to such uses as follow—to the poor of the parish of St Bololph Without, in which I dwell, L.5 in bread yearly; L.5 to the poor of St Giles's yearly in bread; to the poor of St Sepulchre's yearly in bread, L.5, to be given every Sabbath-day in the churches.' The amount of bread at the present time given away in London under this disposition, supplied

by some smaller bequests, is sixty-eight half-quartern loaves a week. The same poor persons, when they once get on the list, continue to receive the bread during their whole lives, unless they cease to reside in the parish, or are struck off the list of pensioners for misconduct.

One Daniel Midwinter, in 1750, left L.1000 to the Stationers' Company, to pay L.14 a year to the parish of St Faith's; and a like sum to Hornsey parish, to be applied in apprenticing two boys or girls of the several parishes, and to fit them out in clothes. At the present time, the money is paid over to the parties receiving the apprentices, with a recommendation to lay it out in clothes for the children.

By the will of John Stock, the parish of Christchurch received, among other legacies, the sum of L.100, the interest of which was directed to be applied in the following manner: one guinea to be paid to the vicar for a sermon to be preached by him on Good-Friday; 10s. to the curate for reading the prayers on that day; and the remainder to be equally distributed among such poor women as chose to remain and receive the sacrament after the service!

A Mr James Wood, amongst other curious provisions, devised to the church-wardens of the parish of St Nicholas Cole Abbey, the sum of 15s. annually, to be given away in twopences to such poor people as they should meet in the streets when going and returning from church on a specified day.

The inhabitants of Watling Street, and other districts in the vicinity of St Antholin's Church, are familiar with the sound of what is known in the neighbourhood as the 'Fish-bell.' This is a bell which rings out every Friday night from St Antholin's tower, to summon the inhabitants to evening prayers: very few people attend to the summons, which comes at an inconvenient time for that busy locality. There stands almost against the walls of the church a pump, which is always in good repair, and yields an excellent supply of water, greatly to the convenience of the neighbourhood. Both the pump and the prayers are the legacy of an old fish-woman of the last century. It is said, that for forty years of her life she was in the habit of purchasing fish in the small hours of the morning at Billingsgate Market; these she washed and prepared for her customers at a small spring near St Antholin's Church, and afterwards cried them about the town upon her head. Having prospered in her calling, she bequeathed a sufficient sum to perpetuate a weekly service in the church, and a good and efficient pump erected over the spring of which she had herself enjoyed a life-long privilege.

In St George's in the East, there is a charity, well-known as Raine's Charity, which was founded by Henry Raine, Esq., in the earlier part of the last century. The charity consists of two endowed schools, sufficiently well provided for the maintenance and instruction of fifty boys and as many girls, and the payment and support of a master and mistress. It is one part of the system of management, that six pupils of either sex leave the schools every year, to make room for as many new ones. By a somewhat whimsical provision in the will of the founder, a species of annual lottery comes off at the discharge of the six girls. If they have behaved well, have been attentive and obedient, and punctual and exact in the observance of their religious duties, they are entitled to draw lots for the sum of L.100, which will be paid to the fortunate holder of the prize as a marriage-portion upon her wedding-day. It is further provided, that the wedding is to take place on the 1st day of May; and that, in addition to the portion, L.5 is to be expended upon a marriage-dinner and a merry-making.

Bequests for the portioning of poor girls and virtuous servant-maids are, indeed, not at all uncommon. In the village of Bawburgh, in Norfolk, there is one

* See Chambers's Pocket Miscellany, vol. iv.

founded in the last century by a Quaker gentleman, who left a sum of money, the interest of which is shared among the servant-girls in the place who get married. The amount is not payable until twelve months after the wedding. The village being small, it will sometimes happen that a good sum accumulates before an applicant comes forward who can substantiate a claim upon it. The object of such bequests as these is sufficiently plain: the donors had evidently in view the counteracting of the wretched tendency of the old poor-law, which, by giving the mother of an illegitimate child a claim upon the parish funds, actually placed a premium upon female frailty.

In London, there are charitable dispositions and bequests for the nursery of every virtue that could be named, but more especially of industry, providence, and thrift. A man may be brought into the world by voluntary contributions; he may be maintained and educated at a foundling asylum, if his parents, as thousands do, choose to throw him upon the public compassion; he may ride into a good business upon the back of a borrowed capital, for which he pays but a nominal interest; and if he fail to realise a competence by his own endeavours, he may perchance revel in some corporation sinecure, or, at the worst, luxuriate in an alms-house, and be finally deposited in the church-yard—and all at other people's expense. On the other hand, if he be made of the right metal, he may carve his way to fortune and to civic fame, and may die full of years and honours—in which case, he is pretty sure to add one more to the list of charitable donors whose legacies go to swell the expectancies of the city poor. It would be difficult for any eccentric testator in the present day to hit upon a new method of disposing of the wealth which he can no longer keep. Every device for the exercise of posthumous generosity seems to have been exhausted long ago.

The trust-estates, the source of so many of the city of London charities, are mostly, if not all, under the control of the corporate companies. How they are managed, is a secret altogether unknown to the public, and of which, indeed, the livery and freemen of some of the companies have but a very limited knowledge. The revenue derived from the trust-estates, according to their own shewing, is not much less than £90,000 a year; but they have large revenues, of which they do not choose to shew any account at all. These are supposed to arise mainly from the increase in value of property originally devised to charitable uses—which increase it is their custom to appropriate as they please. 'Thus, for example,' says a writer on this subject, 'if a testator left to any one of these companies a piece of land then worth £10 per annum, directing that £10 should be annually appropriated to the support of a school, and the land subsequently increases in value to £500, then the master and wardens of the company claim the right of appropriating to their own uses the surplus of £490. In no equitable view of the case can this be deemed to be private property.' It seems probable that these things will be looked into before long. From a motion lately made in the House of Commons, we learn that a thorough investigation is contemplated into the management and application of all charities throughout the kingdom, the inquiry to be conducted at the cost of the several charities, the largest of which are not to pay more than £50, and the smaller ones twopence in the pound, upon the amount of their capital. Perhaps this inquiry may lead to the recovery of some of the charities which are stated to be lost, and of which nothing but the titles, under the denomination of So-and-so's gift, remain upon the corporation records.

The secret management of the trust-estates contrasts curiously with the pompous exhibition which some of the worshipful companies make of their deeds of

benevolence. Some of the smaller and older churches of London are stuck over in the interior with enormous black boards, as big as the church door almost, upon which are emblazoned, in gilt letters, the donations to the poor, to the school, to the repair of the fabric, &c. from the worshipful company of This and That, from the days of King James—the inscriptions of whose time are illegible through the smoke and damp of centuries—down to the days of Queen Victoria, and the donations of last Christmas, fresh and glittering from the hands of the gilder. Thus, the interesting old church of St Bartholomew the Great is lined with the eleemosynary exploits of the worshipful Iron-mongers' Company, whose multitudinous banners of black and gold are in abominable discordance with the severe and simple architecture of the ancient edifice. 'Let not thy left hand know what thy right hand doeth,' is a monition apparently not much in repute among the corporate companies.

The reader may gather from the perusal of the above desultory examples, selected from a mass of similar ones, some idea of the enormous amount of the funds, intended for benevolent purposes, which Christian men have bequeathed to the world; and they may perhaps serve to enlighten the curious observer on the subject of some of the unobtrusive phenomena which occasionally excite his admiration and arouse his conjecture. They are the silent charities of men in the silent land. How much good they do, and how much harm, and on which side the balance is likely to lie—these are questions which for the present we have neither time nor space to discuss.

LABOUR STANDS ON GOLDEN FEET.

THE condition of the working-classes in this country is a subject of intense interest to all thinking men; but it is profitable as well as amusing to transfer our attention sometimes to the same portions of society in other countries. In Germany, for instance, the people are as busy as we are with their 'hand-workers,' and the questions of freedom of industry and general instruction are as warmly discussed as at home. We have now before us a little volume by the philosopher and historian, Zschokke, which, in the form of a fictitious narrative, treats very fully of the status of the mechanic in Fatherland; and we are tempted to cull a few extracts which may afford the reader materials for perhaps an interesting comparison.*

The real hero of the story is Hand-labour, and his progress is described throughout three generations of men. He is the Thought of the book, illustrated by adventure and vicissitude; living when the human agents die in succession; and leaving a distinct and continuous track in the reader's mind, when the names and persons fade or conglomerate in his memory. And yet some of these names and persons are not feebly individualised. The father, the son, and the grandson stand well out upon the canvas; and while the family likeness is strictly preserved from generation to generation, the men are seen independent and alone, each in his own special development. The patriarch was a travelling tinker, who wheeled his wares about the country in a barrow; and then, rising in the world, attained the dignity of a hawker, with a cart of goods, drawn by a little gray ass. His son Jonas trotted on foot beside him in all his journeys, dining like his father on bread and water, and sleeping in barns or stables. But when the boy was old enough, he was

* *Labour Stands on Golden Feet; or, the Life of a Foreign Workman, &c.* By Heinrich Zschokke. London: Groombridge.

turned off to pick up his own subsistence like the red-breasts, the sparrows, and the woodpeckers. 'Listen, my lad,' quoth Daddy Thaddaeus; 'this is the spring. Look for sloes and elderberries, rose-leaves and others for ointment; marjoram, spurge, and thyme, wherever thou mayst and canst. These we will sell to the apothecaries. In summer, gather basketfuls of strawberries, bilberries, and raspberries; carry them to the houses: they will yield money. In winter, let us gather and dry locks of wool, for the saddlers and tapestry-makers, and withes for the basket and mat manufacturers. From the table of the bountiful God, a thousand crumbs are falling for us: these we will pick up. They will give thee cheese to thy bread, and a piece of meat to thy potatoes. Only get to work! I will give thee a little barrow, and a belt for thy shoulders.'

This was his first essay in business on his own account, and he worked hard and thrived well. His separation from his father taught him how to stand on his own legs—an important piece of knowledge in a world that is as full of leave-takings as of meetings; and when they did come together, and the boy counted out his kreutzers, and the father patted him approvingly on the cheek, that boy would have changed places with no prince that ever sat on a throne. Jonas was at length apprenticed to a girdler, or worker in metals; and the old tinker in due time died, leaving his son the parting advice, to 'work, save, and pray,' and a box containing a thousand guilders.

Jonas's apprenticeship passed on pretty much according to universal rule; that is, he did the drudgery of the house as well as learned the trade, and received kicks and cuffs from the journeymen. But in five years his servitude was out, and he was a journeyman himself. He was now, by the rules of his guild, obliged to travel for improvement; he spent five or six years in going to and fro upon the earth, and then came back to Altenheim an accomplished girdler. To become a master, it was necessary to prepare his 'master-piece,' as a specimen of what he could do; and the task allotted to him was to engrave on copper, without rule or compass, the prince's family-crest, and then to gild the work richly. This accomplished, he was received into the guild of masters with much pomp, strange ceremonies, and old-fashioned feasting—all at the charge of the poor beginner. 'Without reckoning the heavy expenses of his mastership, or of clothing, linen, and furniture, in the hired lodgings and workshops, no small sum was requisite for the purchase of different kinds of tools—a lathe, an anvil, crucibles, dies, graving-implements, steel pins, hammers, chisels, tongs, scissors, &c.; and also for the purchase of brass and pinchbeck ware, copper, silver, lead, quicksilver, varnish, brimstone, borax, and other things indispensable for labour. He had also taken, without premium, an apprentice, the child of very poor people, to help him. He would have been very glad to put the rest of his money out to interest again; but he had to provide the means of subsistence for at least one year in advance, for he had to begin with neither wares nor customers.'

Jonas now appears in the character of a lover, and his wooing is one of the most beautiful pictures in the book. His choice has fallen upon a servant-girl, whom he had known in boyhood.

'One morning, Master Jordan sent his apprentice with a message: "Miss Fenchel was to come to him

directly: he had found a good place for her." Martha hastened thither gladly.

"Hast thou found a place for me, dear Jonas?" asked she, giving him her hand gracefully. "Thank God! I began to fear becoming troublesome to our kind friends. Come, tell me where?"

'He looked anxiously into her joyous blue eyes; then, in confusion, down to the ground; then again upwards to the roof of the room, and round the four sides, as though he were seeking something lost.

"Come, tell me, then?" repeated she. "Why art thou silent?"

'He collected himself, and began, hesitating: "It is—but Martha—thou must not be angry with me."

'In surprise, she smiled. "Angry with thee, Jonas! If I would be, and should be, could I be?"

"Listen, Martha; I will shew thee—I must tell thee—I know a man anxious to have thy heart and hand—who—even who?"

"O Jonas, reproach me rather, but do not make mockery of me, a poor maiden!" exclaimed she, shocked or hurt, while her face lost all its colour, and she turned from him.

"Martha, look at me. He is assuredly no bad man. I will bring him to thee; I will give him to thee myself."

"No, Jonas! no! From thee, least of all, can I receive a lover."

"From me, least of all!" asked he with visible emotion. "From me, least of all! And if—I don't know—if I would give thee myself—Look at me, Martha! Tell me."

'Here silence ensued. She stood before him with downcast eyes and glowing cheeks, and played with her apron-string. Then, as if still doubting, she looked up again, her eyes swimming with tears, and said, with trembling lips: "What must I say, then?"

'Jonas took courage, and whispered, half aloud: "Dost thou love me with all thy heart?"

'Half aloud, Martha whispered back: "Thy heart knows it."

"Canst thou be satisfied with dry bread and salt?"

"Rather salt from thee than tears from me!"

"Martha, I will work for thee; wilt thou save for me?"

"I will be sparing in everything, except my own pains!"

"Well then, darling, here is my hand! Take it. Wilt thou be mine?"

"Was I not thine eight years ago and more? Even as a child? Yet no! It ought not to be, Jonas."

'Alarmed, he looked in her face, and asked: "Not be? and why?"

"Think well over it, Jonas! Do thyself no injustice. I am a poor creature, without portion or property. Any other burgher's daughter in the town would be glad to give thee her hand and heart, and a good dowry beside. Thou mightst live much better."

"Say nothing about that," cried Jonas, stretching out both his hands imploringly. "Be still: I shall feel that I am but beginning to live, if thou wilt promise to live with me."

"Live, then!" said she, in blushing embarrassment, and gave him her hand.

'He took her hand, and at the same time clasped his bride to his bosom, that heaved with unwonted emotion. She wept on his breast in silent joy.'

We would fain, if we had room, add to this the marriage sermon, preached by the bridegroom, and well preached too; for Jonas had knowledge, although, as he said himself, he never found half so much in books as is lying everywhere about the road.

Martha was just the wife for the honest, sensible hand-worker; and as it frequently happens with such characters, his affairs prospered from the date of his

marriage. He took a larger house in a better situation for trade; and having presented the useless 'master-piece'—which nobody would buy—to the prince, he was rewarded by the dignity of 'Master-girdler to the Court.' But still 'uprightly and hardily the court-girdler lived with his wife, just as before; active in the workshop and warehouse, at markets and at fairs. Year after year fled, though, before the last guildler could be paid off, of the debt on the house. Days of joy and of sorrow succeeded each other in turn. They were all received with gratitude to God—these as well as those.'

We now come hastily to the third generation; for Jonas had a son called Veit, who was first apprenticed to his father, and then sent to travel as a journeyman. The patriarch had had no education at all; Jonas had snatched at his just as opportunities permitted; but Veit went regularly through the brief and practical curriculum fitted for a tradesman's son. He was, consequently, better informed and more refined than either his father or grandfather; and spent so much time in gaining a thorough insight into the branches connected with his own business, that honest Jonas was quite puzzled. 'Where did the boy get all these notions?' said he. 'He did not get them from me, I'm sure.' Veit had a bad opinion of the travelling custom, and for these reasons: 'How should these men, most of them badly brought up, attain to any greater perfection in their business, if they have left home and school without any preparation for it? No one can understand, if his understanding has not been developed. From one publican they go to another, and from one workshop to another; everywhere they find the old common track—the mechanical, mindless life of labour, just as in the very first place to which they were sent to learn their trade. At most, they acquire dexterity by practice. Now and then they learn a trick from a master, or get a receipt, which had been cautiously kept secret; when possessed of this, they think something of themselves. Even the character of these rambles is not seldom destroyed by intercourse with their fellows. They learn drinking and rioting, gambling and licentiousness, caballing and debating. Many are ruined before they return to their native place. Believe me, dearest father, the time of travel is to very few a true school for life; one in which, through frequent change of good and evil days, the head acquires experience, the thoughts strength and clearness, the heart courage, and reliance on God. Very few, even of those who bring a scientific education with them, can gain much of value for their calling in life; extend their views, transfer and apply to their own line of business the inventions and discoveries that have been made in other departments of art and industry.'

Jonas understood little of the refinements of his son, but he opened his eyes when Veit obtained a lucrative appointment in a large metallic manufactory, first in London and then in Paris. In a letter informing his parents of this good-fortune, were enclosed the whole of the savings from his salary. 'Master Jordan shook his head at this passage, and cried out, deeply moved, yet as though vexed, while a tear of motherly tenderness stole down Martha's cheek: "No! no! by no means! What is the fool thinking of? He'll want the money himself—a simpleton. Let him wait till he comes to the master-piece. What pleases me most in the story, is his contentment and his humility. He is not ashamed of his old silver watch yet. It is not everybody that could act so. There must be strong legs to support such extraordinary good-luck. These the bursch has!"'

After years of absence, the young man at last walks suddenly into the paternal home, on his father's birthday, and makes them all scream and weep with joy. "Hark ye, bursch!" exclaimed Jonas, who regarded him with fatherly delight, "thou seem'st to me almost

too learned, too refined, and too elegant for Veit Jordan. What turner has cut so neat a piece of furniture out of so coarse a piece of timber?" His stay, however, was short. M. and Mme Bellarme (his employer at Paris) 'had been loth, almost afraid, to let him go. The feeble state of health of the former began to be so serious, that he durst not engage in the bulk of his affairs. In the space of a year, both felt so complete confidence in Veit's knowledge of business, and in his honour, that they had taken him as a partner in trade, and in the foundry. Henceforth, M. Bellarme contributed his capital only; Veit his knowledge, care, and industry.'

The reform of the guilds, and the establishment of a technological school for the young hand-workers—both through the instrumentality of Jonas—we have no room to touch; for we must say a parting word on the reunion of the family by Veit's return permanently from abroad. Notwithstanding the prosperity of the now old couple, 'everything, ay, everything, was as he had left it years ago—as he had known it from childhood—only Christiane not. There stood yet the two well-scoured old deal-tables, wrinkled, though, from the protruding fibres of the wood; there were the straw-bottomed stools still; and at the window, Mother Martha's arm-chair, before which, as a child, he had repeated his lessons; there still hung the same little glass between the windows; and the wall-clock above the stove sent forth its tic-tac as fastly as ever. Father Jonas, in his enlarged workshop, with more journey-men and apprentices, smelted and hammered, filed and formed still, from morning to night, as before. The noble housewife flew about yet busy as a bee: she had managed the housekeeping without a servant since Christiane had been grown up. And Veit came back with the same cheerful disposition that he had ever shewn. In the simply-furnished rooms which Martha had fitted up for him, in the upper storey of the house, he forgot the splendid halls, the boudoirs, and antechambers of London, Paris, and the Bellarme estate; the Gobelin tapestry, the gold-framed pictures; the convenience of elegant furniture, and the artificial delicacies of the table on silver-plate.' Assisted by the patronage of the prince, he established a great foundry in his native town, of ball and cannon, bronze and brass; and on his marriage with the aforesaid Christiane, the sovereign made him a handsome present, in a handsome manner, 'as a small token of his gratitude to a family that had been so useful to the country.'

In addition to the hand-workers' school, there now arose, under the auspices of this family, a training-school for teachers, a labour-school for females, and other establishments. The town was embellished; the land in the neighbourhood rose in value; uncleanness and barbarism in food, clothing and houses, disappeared. 'Only old men and women, grown rusty in the habits and the ignorance of many years, complain that the times are worse; at the sight of a higher civilisation, they complain of "the luxury and the pride of the world now-a-days;" as superstition dies out, they complain of "human incredulity, and the downfall of religion." "The day of judgment," say they, is at hand.'

'But Master Jonas, when seventy years had silvered his hair, stood almost equal to a strong man of thirty, happy, indeed, by the side of the pious Martha, in a circle of his children and children's children, honoured by his fellow-citizens, and honoured by his prince. He often told the story of his boyhood, how he used to go about hawking with Father Thaddaeus the tinker; and his face glowed with inward satisfaction, when he compared the former period with present changes, in the production of which he could never have imagined he was to have so considerable a share. Then he used to exclaim: "Have I not always said it? Clear

understanding only in the head, love to one's neighbour in the heart, frugality in the stomach, and industry in the fingers—then: **HAND - WORK STANDS ON GOLDEN FEET.**"

LORD ROSSE'S DISCOVERIES.

As Professor Nichol very truly remarks, 'investigation regarding such aggregations is virtually a branch of atomic and molecular inquiry,' with stars in place of atoms, mighty spheres in place of 'dust,' 'the firmament above' instead of 'the firmament beneath.' In fact, the astronomer, in sweeping with his telescopic eye the 'blue depths of ether,' is, as it were, some Lilliputian inhabitant of an atom prying into the autumnal structure of some Brobdiagnian world of saw-dust, organised into spiral and other elementary forms, of life, it may be, something like our own. The infinite height appears, in short, like the infinite depth, and we knowing not precisely where we stand between the two immensities of depth and height! The shapes evolved by the wonderful telescope of Lord Rosse are, many of them, absolutely fantastical; wonder and awe are mingled with almost ridiculous feelings in contemplating the strange apparitions—strange monstrosities we had almost called them—that are pictured on the background of the illustrations. One aggregation looms forth out of the darkness like the skeleton face of some tremendous mammoth, or other monstrous denizen of ancient times, with two small fiery eyes, however, gazing out of its great hollow orbits; another consists of a central nucleus, with arms of stars radiating forth in all directions, like a star-fish, or like the scattering fire-sparks of some pyrotechnic wheel revolving; a third resembles a great wisp of straw, or twist or coil of ropes; a fourth, a cork-screw, or other spiral, seen on end; a fifth, a crab; a sixth, a dumb-bell—many of them scroll or scrolls of some thin texture seen edgewise; and so on. It is even a suggestion of the author's, that some of the spiral and armed wheels may be revolving yet in the vast ocean of space in which they are engulfed. Thus has the telescope traced the 'binding' influences of the Pleiades, loosened the bands of 'Orion'—erst the chief *nebulous* hazy wonders, once and for all revealing its separate stars: and thus, in brief, has this wondrous instrument 'unrolled the heavens as a scroll.' Yet even these astonishing results are as nothing to the fact, that those fantastic shapes which it has revealed in the depths of this *lambo* of creation, are not shapes merely of the present time—that thousands of years have passed since the light that shewed them left the starry firmaments only now revealed—that the telescope, in short, in reflecting these astonishing shapes, deliver to the eye of mind turned inward on the long-stored records of a universal and eternal memory of the past, than to a mere eye of sense looking outward on the things of passing time!—*The Builder.*

SOUTH-AFRICAN REPTILES.

I was going quietly to bed one evening, wearied by a long day's hunting, when, close to my feet, and by my bedside, some glittering substance caught my eye. I stooped to pick it up; but, ere my hand had quite reached it, the truth flashed across me—it was a snake! Had I followed my first natural impulse, I should have sprung away, but not being able clearly to see in what position the reptile was lying, or which way his head was pointed, I controlled myself, and remained rooted breathless to the spot. Straining my eyes, but moving not an inch, I at length clearly distinguished a huge puff-adder, the most deadly snake in the colony, whose bite would have sent me to the other world in an hour or two. I watched him in silent horror: his head was from me—so much the worse; for this snake, unlike any other, always rises and strikes back. He did not move; he was asleep. Not daring to shuffle my feet, lest he should awake and spring at me, I took a jump backwards, that would have done honour to a gymnastic master, and thus darted outside the door of the room. With a thick stick, I then returned and settled his worship. Some parts of South

Africa swarm with snakes; none are free from them. I have known three men killed by them in one harvest on a farm in Oliphant's Hoek. There is an immense variety of them, the deadliest being the puff-adder, a thick and comparatively short snake. Its bite will kill occasionally within an hour. One of my friends lost a favourite and valuable horse by its bite, in less than two hours after the attack. It is a sluggish reptile, and therefore more dangerous; for, instead of rushing away, like its fellows, at the sound of approaching footsteps, it half raises its head and hisses. Often have I come to a sudden pull-up on foot and on horseback, on hearing their dreaded warning! There is also the cobra-capello, nearly as dangerous, several black snakes, and the boom-slang, or tree-snake, less deadly, one of which I once shot seven feet long. The Cape is also infested by scorpions, whose sting is little less virulent than a snake-bite; and by the spider called the tarantula, which is extremely dreaded.—*The Cape, by A. W. Cole.*

LINES.

Ask me not with simple grace,
Pearls of thought to string for thee;
For upon thy smiling face,
Perfect gems I see—
In thine eyes of beauty trace
Lights that fadeless be.

Did me not from Memory's land,
Cull fair flowers of rich perfume;
Love will shew with trembling hand,
Where far fairer bloom—
Clustering on thy cheek they stand,
Blushing deep—for whom?

Bid me not with Fancy's gale
Wake the music of a sigh;
From thy breath a sweeter tale,
Silver-winged, floats by;
Melodies that never fail,
Heard when thou art nigh!

Ask me not—yet, oh! for thee
Dearer thoughts my bosom fill,
Dimmed with tears I cannot see
To do thy gracious will:
Take, then, my prayer—In heaven may we
Behold thee lovelier still!

PERCIE.

ILLUSTRATIONS OF EXTREME MINUTENESS.

Dr Wollaston obtained platinum-wire so fine, that 30,000 pieces, placed side by side in contact, would not cover more than an inch. It would take 150 pieces of this wire bound together to form a thread as thick as a filament of raw silk. Although platinum is the heaviest of the known bodies, a mile of this wire would not weigh more than a grain. Seven ounces of this wire would extend from London to New York. Fine as is the filament produced by the silkworm, that produced by the spider is still more attenuated. A thread of a spider's web, measuring four miles, will weigh very little more than a single grain. Every one is familiar with the fact, that the spider spins a thread, or cord, by which his own weight hangs suspended. It has been ascertained that this thread is composed of about 6000 filaments.—*Lardner's Handbook.*

PRICE 1½d.

LONDON CROSSING-SWEEPERS.

THERE is no occupation in life, be it ever so humble, which is justly worthy of contempt, if by it a man is enabled to administer to his necessities without becoming a burden to others, or a plague to them by the parade of shoeless feet, fluttering rags, and a famished face. In the multitudinous drama of life, which on the wide theatre of the metropolis is ever enacting with so much intense earnestness, there is, and from the very nature of things there always must be, a numerous class of supernumeraries, who from time to time, by the force of varying circumstances, are pushed and hustled off the stage, and shuffled into the side-scenes, the drear and dusky background of the world's proscenium. Of the thousands and tens of thousands thus rudely dealt with, he is surely not the worst who, wanting a better weapon, shoulders a birch-broom, and goes forth to make his own way in the world, by removing the moist impediments of filth and refuse from the way of his more fortunate fellows. Indeed, look upon him in what light you may, he is in some sort a practical moralist. Though far remote from the ivy chaplet on Wisdom's glorious brow, yet his stump of withered birch inculcates a lesson of virtue, by reminding us, that we should take heed to our steps in our journeyings through the wilderness of life; and, so far as in him lies, he helps us to do so, and by the exercise of a very catholic faith, looks for his reward to the value he supposes us to entertain for that virtue which, from time immemorial, has been in popular parlance classed as next to godliness.

Time was, it is said, when the profession of a street-sweeper in London was a certain road to competence and fortune—when the men of the brooms were men of capital; when they lived well, and died rich, and left legacies behind them to their regular patrons. These palmy days, at anyrate, are past now. Let no man, or woman either, expect a legacy at this time of day from the receiver of his copper dole. The labour of the modern sweeper is nothing compared with his of half a century ago. The channel of viscous mud, a foot deep, through which, so late as the time when George the Third was king, the carts and carriages had literally to plough their way, no longer exists, and the labour of the sweeper is reduced to a tithe of what it was. He has no longer to dig a trench in the morning, and wall up the sides of his fosse with stiff earth, boarded for the purpose, as we have seen him doing in the days when 'Boney' was a terror. The city scavengers have reduced his work to a minimum, and his pay has dwindled proportionately. The twopences which used to be thrown to a sweeper will now

pay for a ride, and the smallest coin is considered a sufficient guerdon for a service so light. But what he has lost in substantial emolument, he has gained in *morale*; he is infinitely more polite and attentive than he was; he sweeps ten times as clean for a half-penny as he did for twopence or sixpence, and thanks you more heartily than was his wont in the days of yore. The truth is, that civility, as a speculation, is found to pay; and the want of it, even among the very lowest rank of industrials in London, is at the present moment not merely a rarity, but an actual phenomenon—always supposing that something is to be got by it.

The increase of vehicles of all descriptions, but more especially omnibuses, which are perpetually rushing along the main thoroughfares, has operated largely in shutting out the crossing-sweepers from what was at one period the principal theatre of their industry. Independent, too, of the unbroken stream of carriages which renders sweeping during the day impossible, and the collection of small coin from the crowd who dart impatiently across the road when a practicable breach presents itself, equally so, it is found that too dense a population is less favourable to the brotherhood of the broom than one ever so sparse and thin. Had the negro of Waithman's obelisk survived the advent of Shillibeer, he would have had to shift his quarters, or to have drawn upon his three-and-a-half per cents. to maintain his position. The sweepers who work on the great lines of traffic from Oxford Street west to Aldgate, are consequently not nearly so numerous as they once were, though the members of the profession have probably doubled their numbers within the last twenty years. They exercise considerable judgment in the choice of their locations, making frequent experiments in different spots, feeling the pulse of the neighbourhood, as it were, ere they finally settle down to establish a permanent connection.

We shall come to a better understanding of the true condition of these muddy nomads by considering them in various classes, as they actually exist, and each of which may be identified without much trouble. The first in the rank is he who is bred to the business, who has followed it from his earliest infancy, and never dreamed of pursuing any other calling. We must designate him as

No. 1. *The Professional Sweeper.*—He claims precedence before all others, as being to the manner born, and inheriting his broom, with all its concomitant advantages, from his father, or mother, as it might be. All his ideas, interests, and affections are centered in one spot of ground—the spot he sweeps, and has swept daily for the last twenty or thirty years, ever since it was bequeathed to him by his parent. The

companion of his childhood, his youth, and his maturer age, is the post buttressed by the curb-stone at the corner of the street. To that post, indeed, he is a sort of younger brother. It has been his friend and support through many a stormy day and blustering night. It is the confidant of his hopes and his sorrows, and sometimes, too, his agent and cashier, for he has cut a small basin in the top of it, where a passing patron may deposit a coin if he choose, under the guardianship of the broom, which, while he is absent for a short half-hour discussing a red herring and a crust for his dinner, leans gracefully against his friend the post, and draws the attention of a generous public to that as the deputy-receiver of the exchequer. Our professional friend has a profound knowledge of character: he has studied the human face divine all his life, and can read at a glance, through the most rigid and rugged lineaments, the indications of benevolence or the want of it; and he knows what aspect and expression to assume, in order to arouse the sympathies of a hesitating giver. He knows every inmate of every house in his immediate neighbourhood; and not only that, but he knows their private history and antecedents for the last twenty years. He has watched a whole generation growing up under his broom, and he looks upon them all as so much material destined to enhance the value of his estate. He is the humble pensioner of a dozen families: he wears the shoes of one, the stockings of another, the shirts of a third, the coats of a fourth, and so on; and he knows the taste of everybody's cookery, and the temper of everybody's cookmaid, quite as well as those who daily devour the one and scold the other. He is intimate with everybody's cat and everybody's dog, and will carry them home if he finds them straying. He is on speaking terms with everybody's servant-maid, and does them all a thousand kind offices, which are repaid with interest by surreptitious scraps from the larder, and jorums of hot tea in the cold wintry afternoons. On the other hand, if he knows so much, he is equally well known: he is as familiar to sight as the Monument on Fish Street Hill to those who live opposite; he is part and parcel of the street view, and must make a part of the picture whenever it is painted, or else it won't be like. You cannot realise the idea of meeting him elsewhere; it would be shocking to your nerves to think of it: you would as soon think of seeing the Obelisk walking up Ludgate Hill, for instance, as of meeting him there—it could not be. Where he goes when he leaves his station, you have not the least notion. He is there so soon as it is light in the morning, and till long after the gas is burning at night. He is a married man, of course, and his wife, a worthy helpmate, has no objection to pull in the same boat with him. When Goggs has a carpet to beat—he beats all the carpets on his estate—Mrs Goggs comes to console the post in his absence. She usually signalises her advent by a desperate assault with the broom upon the whole length of the crossing: it is plain she never thinks that Goggs keeps the place clean enough, and so she brushes him a hint. Goggs has a weakness for beer, and more than once we have seen him asleep on a hot thirsty afternoon, too palpably under the influence of John Barleycorn to admit of a doubt, his broom between his legs, and his back against his abstinent friend the post. Somehow, whenever this happens, Mrs G. is sure to hear of it, and she walks him off quietly, that the spectacle of a sweeper overtaken may not bring a disgrace upon the profession; and then, broom in hand, she takes her stand, and does his duty for the remainder of the day. The receipts of the professional sweeper do not vary throughout the year so much as might be supposed. They depend very little upon chance contributions: these, there is no doubt, fall off considerably, if they do not fail altogether, during a continuance of dry weather,

when there is no need of the sweeper's services; but the man is remunerated chiefly by regular donations from known patrons, who form his connection, and who, knowing that he must eat and drink be the weather wet or dry, bestow their periodical pittances accordingly.

No. 2 is the *Morning Sweeper*.—This is rather a knowing subject, one, at least, who is capable of drawing an inference from certain facts. There are numerous lines of route, both north and south of the great centres of commerce, and all converging towards the city as their nucleus, which are traversed, morning and evening, for two or three consecutive hours, by bands of gentleman-looking individuals: clerks, book-keepers, foremen, business-managers, and such like responsible functionaries, whose unimpeachable outer integuments testify to their regard for appearances. This current of respectability sets in towards the city at about half-past six in the morning, and continues its flow until just upon ten o'clock, when it may be said to be high-water. Though a large proportion of these agents of the world's traffic are daily borne to and from their destination in omnibuses, still the great majority, either for the sake of exercise or economy, are foot-passengers. For the accommodation of the latter, the crossing-sweeper stations himself upon the dirtiest portion of the route, and clearing a broad and convenient path ere the sun is out of bed, awaits the inevitable tide, which must flow, and which can hardly fail of bringing him some remuneration for his labour. If we are to judge from the fact, that along one line of route which we have been in the habit of traversing for several years, we have counted as many as fourteen of these morning sweepers in a march of little more than two miles, the speculation cannot be altogether unprofitable. In traversing the same route in the middle of the day, not three of the sweepers would be found at their post; and the reason would be obvious enough, since the streets are then comparatively deserted, being populous in the morning only, because they are so many short-cuts or direct thoroughfares from the suburbs to the city. The morning sweeper is generally a lively and active young fellow; often a mere child, who is versed in the ways of London life, and who, knowing well the value of money from the frequent want of it, is anxious to earn a penny by any honest means. Ten to one, he has been brought up in the country, and has been tutored by hard necessity, in this great wilderness of brick, to make the most of every hour, and of every chance it may afford him. He will be found in the middle of the day touting for a job at the railway stations, to carry a portmanteau or to wheel a truck; or he will be at Smithfield, helping a butcher to drive to the slaughter-house his bargain of sheep or cattle; or in some livery-yards, currying a horse or cleaning out a stable. If he can find nothing better to employ him, he will return to his sweeping in the evening, especially if it be summer-time, and should set in wet at five or six o'clock. When it is dark early, he knows that it won't pay to resume the broom; commercial gentlemen are not particular about the condition of their Wellingtons, when nobody can see to criticise their polish, and all they want is to exchange them for slippers as soon as possible. If we were to follow the career of this industrious fellow up to manhood, we should in all probability find him occupying worthily a hard-working but decent and comfortable position in society.

No. 3 is the *Occasional Sweeper*.—Now and then, in walking the interminable streets, one comes suddenly upon very questionable shapes, which, however, we don't question, but walk on and account for them mythically if we can. Among these singular apparitions which at times have startled us, not a few have borne a broom in their hands, and appealed to us for a reward for services which, to say the best of them, were extremely doubtful. Now an elderly gentleman

in silver spectacles, with pumps on his feet, and a roquelaure with a fur-collar over his shoulders, and an expression of unutterable anguish in his countenance, holds out his hand and bows his head as we pass, and groans audibly the very instant we are within earshot of a groan; which is a distance of about ten inches in a London atmosphere. Now an old, old man, tall, meagre, and decrepit, with haggard eye and moonstruck visage, bares his aged head to the pattering rain—

'Loose his beard and hoary hair
Stream like a meteor to the troubled air.'

He makes feeble and fitful efforts to sweep a pathway across the road, and the dashing cab pulls up suddenly just in time to save him from being hurled to the ground by the horse. Then he gives it up as a vain attempt, and leans, the model of despair, against the wall, and wrings his skeleton fingers in agony—when just as a compassionate matron is drawing the strings of her purse, stopping for her charitable purpose in a storm of wind and rain, the voice of the policeman is heard over her shoulder: 'What! you are here at it again, old chap? Well, I'm blown if I think anything 'll cure you. You'd better put up your pus, marm: if he takes your money, I shall take him to the station-us, that's all. Now, old chap—trot, trot, trot!' And away walks the old impostor, with a show of activity perfectly marvellous for his years, the policeman following close at his heels till he vanishes in the arched entry of a court.

The next specimen is perhaps a 'swell' out at elbows, a seedy and somewhat ragged remnant of a very questionable kind of gentility—a gentility engendered in 'coal-boles' and 'cider-cellars,' in 'shades,' and such-like midnight 'kens'—suckled with brandy and water and port-wine negus, and fed with deviled kidneys and toasted cheese. He has run to the end of his tether, is cleaned out even to the last disposable shred of his once well-stocked wardrobe; and after fifty high-flying and desperate resolves, and twice fifty mean and sneaking devices to victimise those who have the misfortune to be assailable by him, 'to this complexion he has come at last.' He has made a track across the road, rather a slovenly disturbance of the mud than a clearance of it; and having finished his performance in a style to indicate that he is a stranger to the business, being born to better things, he rears himself with front erect and arms a-kimbo, with one foot advanced after the approved statuesque model, and exhibits a face of scornful brass to an unsympathising world, before whom he stands a monument of neglected merit, and whom he doubtless expects to overwhelm with unutterable shame for their abominable treatment of a man and a brother—and a gentleman to boot. This sort of exhibition never lasts long, it being a kind of standing-dish for which the public have very little relish in this practical age. The 'swell' sweeper generally subsides in a week or two, and vanishes from the stage, on which, however ornamental, he is of very little use.

The occasional sweeper is much oftener a poor countryman, who has wandered to London in search of employment, and, finding nothing else, has spent his last fourpence in the purchase of a besom, with which he hopes to earn a crust. Here his want of experience in town is very much against him. You may know him instantly from the old *habitué* of the streets: he plants himself in the very thick and throng of the most crowded thoroughfare—the rapids, so to speak, of the human current—where he is of no earthly use, but, on the contrary, very much in the way, and where, while everybody wishes him at Jericho, he wonders that nobody gives him a copper; or he undertakes impossible things, such as the sweeping of the whole width of Charing Cross from east to west, between the equestrian statue and Nelson's Pillar, where, if he sweep the whole, he can't collect, and if he collect, he can't sweep,

and he breaks his heart and his back too in a fruitless vocation. He picks up experience in time; but he is pretty sure to find a better trade before he has learned to cultivate that of a crossing-sweeper to perfection.—Many of these occasional hands are Hindoos, Lascars, or Orientals of some sort, whose dark skins, contrasted with their white and scarlet drapery, render them conspicuous objects in a crowd; and from this cause they probably derive an extra profit, as they can scarcely be passed by without notice. The sudden promotion of one of this class, who was hailed by the Nepaulese ambassador as he stood, broom in hand, in St Paul's Churchyard, and engaged as dragoman to the embassy, will be in the recollection of the reader. It would be impossible to embrace in our category even a tithe of the various characters who figure in London as occasional sweepers. A broom is the last resort of neglected and unemployed industry, as well as of sudden and unfriended ill-fortune—the sanctuary to which a thousand victims fly from the fiends of want and starvation. The broken-down tradesman, the artisan out of work, the decayed gentleman, the ruined gambler, the starving scholar—each and all we have indubitably seen brooming the muddy ways for the chance of a half-penny or a penny. It is not very long since we were addressed in Water Street, Blackfriars, by a middle-aged man in a garb of seedy black, who handled his broom like one who played upon a strange instrument, and who, wearing the words *pauper et pedester* written on a card stuck in his hat-band, told us, in good colloquial Latin, a tale of such horrifying misery and destitution, that we shrink from recording it here. We must pass on to the next on our list, who is—

No. 4, the *Lucius-a-non*, or a sweeper who never sweeps.—This fellow is a vagabond of the first-water, or of the first-mud rather. His stock in trade is an old worn-out broom-stump, which he has shouldered for these seven years past, and with which he has never displaced a pound of soil in the whole period. He abominates work with such a crowning intensity, that the very pretence of it is a torture to him. He is a beggar without a beggar's humbleness; and a thief, moreover, without a thief's hardihood. He crawls lazily about the public ways, and begs under the banner of his broom, which constitutes his protection against the police. He will collect alms at a crossing which he would not cleanse to save himself from starvation; or he will take up a position at one which a morning sweeper has deserted for the day, and glean the sorry remnants of another man's harvest. He is as insensible to shame as to the assaults of the weather; he will watch you picking your way through the mire over which he stands sentinel, and then impudently demand payment for the performance of a function which he never dreams of exercising; or he will stand in your path in the middle of the splashy channel, and pester you with whining supplications, while he kicks the mire over your garments, and bars your passage to the pavement. He is worth nothing, not even the short notice we have taken of him, or the trouble of a whipping, which he ought to get, instead of the coins that he contrives to extract from the heedless generosity of the public.

No. 5 is the *Sunday Sweeper*.—This neat, dapper, and cleanly variety of the genus besom, is usually a young fellow, who, pursuing some humble and ill-paid occupation during the week, ekes out his modest salary by labouring with the broom on the Sunday. He has his regular 'place of worship,' one entrance of which he monopolises every Sabbath morning. Long before the church-going bell rings out the general invitation, he is on the spot, sweeping a series of paths all radiating from the church or chapel door to the different points of the compass. The business he has cut out for himself is no sinecure; he does his work so effectually, that you marvel at the achievement, and doubt

if the floor of your dwelling be cleaner. Then he is himself as clean as a new pin, and wears a flower in his button-hole, and a smile on his face, and thanks you so becomingly, and bows so gracefully, that you cannot help wishing him a better office; and of course, to prove the sincerity of your wish, you pay him at a better rate. When the congregation are all met, and the service is commenced, he is religious enough, or knowing enough, to walk stealthily in, and set himself upon the poor bench, where he sits quietly, well behaved and attentive to the end; for which very proper conduct he is pretty sure to meet an additional reward during the exit of the assembly, as they defile past him at the gate when all is over. In the afternoon, he is off to the immediate precinct of some park or public promenade; and selecting a well-frequented approach to the general rendezvous, will cleanse and purify the crossing or pathway in his own peculiar and elaborate style, vastly to the admiration of the gaily-dressed pedestrians, and it is to be supposed, to his own profit. Besides this really clever and enterprising genius, there is a numerous tribe of a very different description, who must sally forth literally by the thousand every Sunday morning when the weather is fine, and who take possession of every gate, stile, and wicket, throughout the widespread suburban districts of the metropolis in all directions. They are of both sexes and all ages; and go where you will, it is impossible to go through a gate, or get over a stile, without the proffer of their assistance, for which, of course, you are expected to pay, whether you use it or not. Some of these fellows have a truly ruffianly aspect, and waylay you in secluded lanes and narrow pathways; and carrying a broom-stump, which looks marvellously like a bludgeon, no doubt often levy upon the apprehensions of a timorous pedestrian a contribution which his charity would not be so blind as to bestow. The whole of this tribe constitute a monster-nuisance, which ought to be abated by the exertions of the police.

No. 6 are the *deformed, maimed, and crippled sweepers*, of whom there is a considerable number constantly at work, and, to do them justice, they appear by no means the least energetic of the brotherhood. Nature frequently compensates bodily defects by the bestowal of a vigorous temperament. The sweeper of one leg or one arm, or the poor cripple who, but for the support of his broom, would be crawling on all-fours, is as active, industrious, and efficient as the best man on the road; and he takes a pride in the proof of his prowess, surveying his work when it is finished with a complacency too evident to escape notice. He considers, perhaps, that he has an extra claim upon the public on account of the afflictions he has undergone, and we imagine that such claim must be pretty extensively allowed: we know no other mode of accounting for the fact, that now and then one of these supposed maimed or halt performers turns out to be an impostor, who, considering a broken limb, or something tantamount to that, essential to the success of his broom, concocts an impromptu fracture or amputation to serve his purpose. Some few years ago, a lively, sailor-looking fellow appeared as a one-handed sweeper in a genteel square on the Surrey side of the water. The right sleeve of his jacket waved empty in the wind, but he flourished his left arm so vigorously in the air, and completed the gyration of his weapon, when it stuck fast in the mud, so manfully by the impulse of his right leg, that he became quite a popular favourite, and won 'copper opinions from all sorts of men,' to say nothing of a shower of sixpences from the ladies in the square. Unfortunately for the continuance of his prosperity, a gentleman intimate with one of his numerous patronesses, while musing in the twilight at an upstairs window, saw the fellow enter his cottage after his day's work, release his right arm from the durance in which it had lain beneath his jacket for ten or twelve hours,

and immediately put the power of the long-imprisoned limb to the test by belabouring his wife with it. That same night every tenant in the square was made acquainted with the disguised arm, and the use for which it was reserved, and the ingenious performer was the next morning delivered over to the police. The law, however, allows a man to dispose of his limbs as he chooses; and as the delinquent was never proved to have said that he had lost an arm; and as he urged that one arm being enough for the profession he had embraced, he considered he had a right to reserve the other until he had occasion for it—he was allowed to go about his business.

No. 7, and the last in our classification, are the *Female Sweepers*.—It is singular, that among these we rarely if ever meet with young women, properly so called. The calling of a crossing-sweeper, so far as it is carried on by females, is almost entirely divided between children or young girls, and women above the age of forty. The children are a very wandering and fickle race, rarely staying for many weeks together in a single spot. This love of change must militate much against their success, as they lose the advantage of the charitable interest they would excite in persons accustomed to meet them regularly in their walks. They are not, however, generally dependent upon the produce of their own labours for a living, being for the most part the children of parents in extremely low circumstances, who send them forth with a broom to pick up a few halfpence to assist in the daily provision for the family. The older women, on the other hand, of whom there is a pretty stout staff scattered throughout the metropolis, are too much impressed with the importance of adhering constantly to one spot, capriciously to change their position. They would dread to lose a connection they have been many years in forming, and they will even cling to it after it has ceased to be a thoroughfare through the opening of a new route, unless they can discover the direction their patrons have taken. When a poor old creature, who has braved the rheumatism for thirty years or so, finds she can stand it no longer, we have known her induct a successor into her office by attending her for a fortnight or more, and introducing the new-comer to the friendly regard of her old patrons. The exceptions to these two classes of the old and the very juvenile, will be found to consist mostly of young widows left with the charge of an infant family more or less numerous. Some few of these there are, and they meet with that considerate reception from the public which their distressing cases demand. The spectacle of a young mother, with an infant on one arm muffled up from the driving rain, while she plies a broom single-handed, is one which never appeals in vain to a London public. With a keen eye for imposture, and a general inclination to suspect it, the Londoner has yet compassion, and coin, too, to bestow upon a deserving object. It is these poor widows who, by rearing their orphaned offspring to wield the broom, supplement the ranks of the professional sweepers. They become the heads of sweeping families, who in time leave the maternal wing, and slift for themselves. We might point to one whom we have encountered almost daily for the last ten years. In 1841, she was left a widow with three small children, the eldest under four, and the youngest in arms. Clad in deep mourning, she took up a position at an angular crossing of a square, and was allowed to accommodate the two elder children upon some matting spread upon the steps of a door. With the infant in one arm, she plied her broom with the other, and held out a small white hand for the reception of such charity as the passers-by might choose to bestow. The children grew up strong and hearty, in spite of their exposure to the weather at all seasons. All three of them are at the present moment sweepers in the same line of route, at no great distance from the mother, who, during the

whole period, has scarcely abandoned her post for a single day. Ten years' companionship with sun and wind, and frost and rain, have doubled her apparent age, but her figure still shews the outline of gentility, and her face yet wears the aspect and expression of better days. We have frequently met the four returning home together in the deepening twilight, the elder boy carrying the four brooms strapped together on his shoulder.

The sweeper does better at holiday seasons than at any other time. If he is blessed with a post for a companion, he decks it with a flower or sprig of green, and sweeps a clear stage round it, which is said to be a difficult exploit, though we have never tried it. At Christmas, he expects a double fee from his old patrons, and gets it too, and a substantial slice of plum-pudding from the old lady in the first floor opposite. He decks the entrance to his walk with laurel and holly, in honour of the day, and of his company, who walk under a triumphal arch of green, got up for that occasion only. He is sure of a good collection on that day, and he goes home with his pocket heavy and his heart light, and treats himself to a pot of old ale, warmed over a fire kindled with his old broom, and sipped sparingly to the melody of a good old song about the good old times, when crossing-sweepers grew rich, and bequeathed fortunes to their patrons.

INSECT WINGS.

ANIMALS possess the power of feeling, and of effecting certain movements, by the exercise of a muscular apparatus with which their bodies are furnished. They are distinguished from the organisations of the vegetable kingdom by the presence of these attributes. Every one is aware, that when the child sees some strange and unknown object he is observing start suddenly into motion, he will exclaim: 'It is alive!' By this exclamation, he means to express his conviction that the object is endowed with *animal* life. Power of voluntary and independent motion and animal organisation are associated together, as inseparable and essentially connected ideas, by even the earliest experience in the economy and ways of nature.

The animal faculty of voluntary motion, in almost every case, confers upon the creature the ability to transfer its body from place to place. In some animals, the weight of the body is sustained by immersion in a fluid as dense as itself. It is then carried about with very little expenditure of effort, either by the waving action of vibratile cilia scattered over its external surface, or by the oar-like movement of certain portions of its frame especially adapted to the purpose. In other animals, the weight of the body rests directly upon the ground, and has, therefore, to be lifted from place to place by more powerful mechanical contrivances.

In the lowest forms of air-living animals, the body rests upon the ground by numerous points of support; and when it moves, is wriggled along piecemeal, one portion being pushed forward while the rest remains stationary. The mode of progression which the little earthworm adopts, is a familiar illustration of this style of proceeding. In the higher forms of air-living animals, a freer and more commodious kind of movement is provided for. The body itself is raised up from the ground upon pointed columns, which are made to act as levers as well as props. Observe, for instance, the tiger-beetle, as it runs swiftly over the uneven surface of the path in search of its dinner, with its eager antennæ thrust out in advance. Those six long and slender legs that bear up the body of the insect, and still keep advancing in regular alternate order, are steadied and worked by cords laid along on the hollows and grooves of their own substance. While some of them uphold the weight of the superincumbent

body, the rest are thrown forwards, as fresh and more advanced points of support on to which it may be pulled. The running of the insect is a very ingenious and beautiful adaptation of the principles of mechanism to the purposes of life.

But in the insect organisation, a still more surprising display of mechanical skill is made. A comparatively heavy body is not only carried rapidly and conveniently along the surface of the ground, it is also raised entirely up from it at pleasure, and transported through lengthened distances, while resting upon nothing but the thin transparent air. From the top of the central piece—technically termed thoracic—of the insect's body, from which the legs descend, two or more membranous sails arise, which are able to beat the air by repeated strokes, and to make it, consequently, uphold their own weight, as well as that of the burden connected with them. These lifting and sustaining sails are the insect's wings.

The wings of the insect are, however, of a nature altogether different from the apparently analogous organs which the bird uses in flight. The wings of the bird are merely altered fore-legs. Lift up the front extremities of a quadruped, keep them asunder at their origins by bony props, fit them with freer motions and stronger muscles, and cover them with feathers, and they become wings in every essential particular. In the insect, however, the case is altogether different. The wings are not altered legs; they are superadded to the legs. The insect has its fore-legs as well as its wings. The legs all descend from the under surface of the thoracic piece, while the wings arise from its upper surface. As the wings are flapping above during flight, the unchanged legs are dangling below, in full complement. The wings are, therefore, independent and additional organs. They have no relation whatever to limbs, properly so called. But there are some other portions of the animal economy with which they do connect themselves, both by structure and function. The reader will hardly guess what those wing-allied organs are.

There is a little fly, called the May-fly, which usually makes its appearance in the month of August, and which visits the districts watered by the Seine and the Marne in such abundance, that the fishermen of these rivers believe it is showered down from heaven, and accordingly call its living clouds, manna. Reaumur once saw the May-flies descend in this region like thick snow-flakes, and so fast, that the step on which he stood by the river's bank was covered by a layer four inches thick in a few minutes. The insect itself is very beautiful: it has four delicate, yellowish, lace-like wings, freckled with brown spots, and three singular hair-like projections hanging out beyond its tail. It never touches food during its mature life, but leads a short and joyous existence. It dances over the surface of the water for three or four hours, dropping its eggs as it flits, and then disappears for ever. Myriads come forth about the hour of eight in the evening; but by ten or eleven o'clock not a single straggler can be found alive.

From the egg which the parent May-fly drops into the water, a six-legged grub is very soon hatched. This grub proceeds forthwith to excavate for himself a home in the soft bank of the river, below the surface of the water, and there remains for two long years, feeding upon the decaying matters of the mould. During this aquatic residence, the little creature finds it necessary to breathe; and that he may do so comfortably, notwithstanding his habits of seclusion, and his constant immersion in fluid, he pushes out from his shoulders and back a series of delicate little leaf-like plates. A branch of one of the air-tubes of his body enters into each of these plates, and spreads out into its substance. The plates are, in fact, gills—that is, respiratory organs, fitted for breathing beneath the water. The little

fellow may be seen to wave them backwards and forwards with incessant motion, as he churns up the fluid, to get out of it the vital air which it contains.

When the grub of the May-fly has completed his two years of probation, he comes out from his subterranean and subaqueous den, and rises to the surface of the stream. By means of his flapping and then somewhat enlarged gills, he half leaps and half flies to the nearest rush or sedge he can perceive, and clings fast to it by means of his legs. He then, by a clever twist of his little body, splits open his old fleshy skin, and slowly draws himself out, head, and body, and legs; and, last of all, from some of those leafy gills he pulls a delicate crumpled-up membrane, which soon dries and expands, and becomes lace-netted and brown-fretted. The membrane which was shut up in the gills of the aquatic creature, was really the rudiment of its now perfected wings.

The wings of the insect are then a sort of external lungs, articulated with the body by means of a movable joint, and made to subserve the purposes of flight. Each wing is formed of a flattened bladder, extended from the general skin of the body. The sides of this bladder are pressed closely together, and would be in absolute contact but for a series of branching rigid tubes that are spread out in the intervening cavity. These tubes are air-vessels; their interiors are lined with elastic, spirally-rolled threads, that serve to keep the channels constantly open; and through these open channels the vital atmosphere rushes with every movement of the membranous organ. The wing of the May-fly flapping in the air is a respiratory organ, of as much importance to the wellbeing of the creature in its way, as the gill-plate of its grub prototype is when vibrating under the water. But the wing of the insect is not the only respiratory organ: its entire body is one vast respiratory system, of which the wings are offsets. The spirally-lined air-vessels run everywhere, and branch out everywhere. The insect, in fact, circulates air instead of blood. As the prick of the finest needle draws blood from the flesh of the backboned creature, it draws air from the flesh of the insect. Who will longer wonder, then, that the insect is so light? It is aerial in its inner nature. Its arterial system is filled with the ethereal atmosphere, as the more stolid creature is with heavy blood.

If the reader has ever closely watched a large fly or bee, he will have noticed that it has none of the respiratory movements that are so familiar to him in the bodies of quadrupeds and birds. There is none of that heaving of the chest, and out-and-in movement of the sides, which constitute the visible phenomena of breathing. In the insect's economy, no air enters by the usual inlet of the mouth. It all goes in by means of small air-mouths placed along the sides of the body, and exclusively appropriated to its reception. Squeezing the throat will not choke an insect. In order to do this effectually, the sides of the body, where the air-mouths are, must be smeared with oil.

In the vertebrated animals, the blood is driven through branching tubes to receptacles of air placed within the chest; the air-channels terminate in blood extremities, and the blood-vessels cover these as a net-work. The mechanical act of respiration merely serves to change the air contained within the air-receptacles. In the insects, this entire process is reversed; the air is carried by branching tubes to receptacles of blood scattered throughout the body; the blood-channels terminate in blood-extremities, and a capillary net-work of air-vessels is spread over these. Now, in the vertebrated creature, the chest is merely the grand air-receptacle into which the blood is sent to be aerated; while in the insect, the chest contains but its own proportional share of the great air-system. In the latter case, therefore, there is a great deal of available space, which would have been, under other

circumstances, filled with the respiratory apparatus, but is now left free to be otherwise employed. The thoracic cavity of the insect serves as a storeroom for the bulky and powerful muscles that are required to give energy to the legs and wings. The portion of the body that is almost exclusively respiratory in other animals, becomes almost as exclusively motor in insects. It holds in its interior the chief portions of the cords by which the moving levers and membranes are worked, and its outer surface is adorned by those levers and membranes themselves. Both the legs and wings of the insect are attached to the thoracic segment of its body.

The extraordinary powers of flight which insects possess are due to the conjoined influences of the two conditions that have been named—the lightness of their air-filled bodies, and the strength of their chest-packed muscles. Where light air is circulated instead of heavy blood, great vascularity serves only to make existence more ethereal. Plethora probably takes the insect nearer to the skies, instead of dragging it towards the dust. The hawk-moth, with its burly body, may often be seen hovering gracefully, on quivering wings, over some favourite flower, as if it were hung there on cords, while it rifles it of its store of accumulated sweets by means of its long unfolded tongue. The common house-fly makes 600 strokes every second in its ordinary flight, and gets through five feet of space by means of them; but when alarmed, it can increase the velocity of its wing-strokes some five or six fold, and move through thirty-five feet in the second. Kirby believed, that if the house-fly were made equal to the horse in size, and had its muscular power increased in the same proportion, it would be able to traverse the globe with the rapidity of lightning. The dragon-fly often remains on the wing in pursuit of its prey for hours at a stretch, and yet will sometimes baffle the swallow by its speed, although that bird is calculated to be able to move at the rate of a mile in a minute. But the dexterity of this insect is even more surprising than its swiftness, for it is able to do what no bird can: it is able to stop instantaneously in the midst of its most rapid course, and change the direction of its flight, going sideways or backwards, without altering the position of its body.

As a general rule, insect wings that are intended for employment in flight are transparent membranes, with the courses of the air-tubes marked out upon them as opaque nervures. These air-tubes, it will be remembered, are lined by spires of dense cartilage; and hence it is that they become nervures so well adapted to act like tent-lines in keeping the expanded membranes stretched. In the dragon-flies, the nervures are minutely netted for the sake of increased strength; in the bees, the nervures are simply parallel. Most insects have two pairs of these transparent membranous wings; but in such as burrow, one pair is converted into a dense leather-like case, under which the other pair are folded away. In the flies, only one pair of wings can be found at all, the other pair being changed into two little club-shaped bodies, called balancers.

Butterflies and moths are the only insects that fly by means of opaque wings; but in their case the opacity is apparent rather than real, for it is caused by the presence of a very beautiful layer of coloured scales spread evenly over the outer surface of the membranes. When these scales are brushed off, membranous wings of the ordinary transparent character are disclosed. The scales are attached to the membrane by little stems, like the quill-ends of feathers, and they are arranged in overlapping rows. The variegated colours and patterns of the insects are entirely due to them. If the wings of a butterfly be pressed upon a surface of card-board covered with gum-water to the extent of their own outlines, and be left there until the gum-water is dry, the outer layer of scales may be rubbed off with a handkerchief, and the double membranes and

intervening nervures may be picked away piecemeal with a needle's point, and there will remain upon the card a most beautiful representation of the other surface of the wings, its scales being all preserved by the gum in their natural positions. If the outlines of the wings be carefully pencilled first, and the gum-water be then delicately and evenly brushed on, just as far as the outlines, a perfect and durable fac-simile, in all the original variety of colour and marking, is procured, which needs only to have the form of the body sketched in, to make it a very pretty and accurate delineation of the insect.

RUSTICATION IN A FRENCH VILLAGE.

POVERTY is difficult to bear under any circumstances, but when compelled entirely to alter our habits of life in the same place where we have lived differently, we certainly feel it more acutely than when we at once change the scene, and see around us nothing we can well compare with what is past. It is unnecessary to say by what means our easy fortune was reduced to a mere pittance; but, alas! it was so, and we found ourselves forced to seek another dwelling-place. Following the example of most of our country-people in a similar situation, therefore, we resolved to go abroad; not, indeed, to enjoy society on an income which would in England totally shut us out from it, but to live in absolute retirement upon next to nothing. A cousin of mine—whose friend, Mlle de Flotte, long resident in England, had married a countryman of her own, and settled in Normandy—wrote to Mme de Terelcourt accordingly, to ask if there was a habitable hut in her neighbourhood where we might find shelter for three years, before which time we were told the settlement of our affairs could scarcely be completed. The answer was favourable: there was, she said, near the village of Flotte, a cottage which contained a kitchen, three rooms, and a garret where a *bonne* might sleep. A large garden was attached to it full of fruit-trees, though in a most neglected condition, and even the house requiring to be made weather-tight; but as the landlord undertook this latter business, and the rent for the whole was only L.12 a year, we gladly closed with the offer, and at the end of the month of April proceeded to take possession of our new home.

The situation was most lovely. The garden surrounded three sides of the cottage; and a large green field, or rather thinly-planted apple-orchard, the other, where grazed four fine cows belonging to a farm on the opposite side of the lane, which supplied us with butter, eggs, and milk, and was near enough not to annoy but to gratify our ears with the country sounds so pleasant to those fond of rural things, and to give us the feeling of help at hand in case of any emergency. We were on the slope of a tolerably lofty hill; the high-road was below, where we could see and hear the diligence pass; but saving this, the farm-yard noises, and the birds and bees in the garden, were the only disturbers of our perfect quiet, except, indeed, the soothing sound of a small brook tinkling over a tiny waterfall, quite audible, although a good way on the other side of the *grande route*. The town of C— was seen to our right, the sea glittering beyond; and a rocky, shrubby dell, through which the little stream above mentioned murmured merrily on its way, turning a rustic mill, was the prospect from the windows. Two lime-trees stood at the gate, inside of which we joyfully discovered an unexpected lodge or cottage, containing

two little rooms and a large shed, which had not been mentioned in the description, and which we found most useful for stowing away packing-cases, hampers, and boxes, keeping potatoes and apples, and a hundred things besides. The short road—avenue, our landlord termed it—which led from this to the house, had a strawberry-bank on one side, a row of cherry-trees on the other; and the garden, although overgrown with weeds and sprawling shrubs, looked quite capable of being easily made very pretty indeed. The entrance to this our magnificent chateau was through the kitchen only; for the room next it, although it could boast of an outside-door likewise, had none which opened into the interior of the house, was neither lathed nor plastered, and the bare earth was all there was to tread upon. Upstairs the flooring consisted merely of planks laid down; and you could hear when below the pins dropped from above, unless, indeed, they fell, as they generally did, into the large crevices. The *bonne's mansarde* was but a garret, where, till you got into the very middle, you could not stand upright; and although the tiled roof had been just painted and repaired, the breath of heaven came woefully in every direction, even through the thick-leaved vines which covered it, closely trained up there, to make room for the apricots that grew against the wall below. Close by, a little stair led you out upon a terrace, where a road, bordered by peach-trees and backed by plums, gave a dry walk in all weathers; but you could go higher, higher, and higher still, terrace after terrace, till it terminated in a rock covered with briars and brambles—the fruit of which latter were as large and as good as mulberries. This we called our garden-wall, and it had a sunny seat commanding an extensive view, and from which all we saw was beautiful. How often have I sat there dreaming, lulled by the murmur of the insect world around, till the merry fife of a band of conscripts on their march, or the distant boom of a cannon from the forts, restored me to a consciousness that I was still at least in the world, although not of it.

But now I am going to descend to figures, and can assure my incredulous English readers, that what I relate is strictly true—*vraie*, although not *vraisemblable*. We hired a stout girl to weed and wash, without food, at 2½d. a day; and another for L.5 per annum undertook to be our sole servant—to clean, and cook, and dress madame, only stipulating that she was to have *soupe à la graisse* and brown bread *à discrétion* three times a day, two sous for cider, her aprons, and washing; but hoped if she gave satisfaction, that sometimes upon Sunday she might be allowed a bit of meat: on Fridays an egg and an apple contented her, and an occasional fish made her shout with joy. An old soldier, who had returned to his primitive employment of gardener, and lived near, undertook to dig, prune, and plant in the garden for a franc a day, during the time we ourselves were engaged with the inside of our mansion, and to come afterwards at 2d. an hour when we wanted him, either to go to C— for marketing, or to do anything else we required, for the hamlet of Flotte did not possess many shops. At this hamlet, however, we obtained bread and a variety of small articles on very moderate terms.

Having hired the requisite furniture, and papered the walls of our apartments, the humble tenement looked clean and comfortable. To get all into order, we both worked hard, and very soon could sit down by 'our own fireside' in a quiet, cheerful house, almost the work of our own hands, and therefore every creek and cranny in it full of interest. Mme de Terelcourt, with refined politeness, did not attempt

to visit us herself until she understood we could receive her *sans gêne*; but she sent fruit and vegetables, and kind messages constantly, and at last a note intimating that she would, if convenient, call upon us after church next day. Strawberries and cream, butter, eggs, fresh bread, and the commonest *vin ordinaire*, were easily procured, of which our guest ate heartily, saying she would bring the rest of the family next day to partake of a similar feast. They came accordingly, and with them a cart loaded with shrubs, plants, flowers, and a whole hive of honey-comb, and various little comforts besides, pretending that they were thankful to us for receiving their superabundance, instead of obliging them to throw it away. This hospitable, unaffected kindness continued unabated the whole time of our stay, and the kind beings always contrived to make out that they were the obliged persons, and we so polite and condescending for deigning to receive such trifles. M. and Mme de Terelcourt lived with M. le Marquis de Flotte and his wife; and her brother, the Count de Belgravin, occupied a house a quarter of a mile distant, which, although by no means a comfortable residence, he rented purposely to be near his sister. These amiable people spent a part of every day together, for they did not associate much with the inhabitants of C—; and I look back with much pleasure to our social evenings, when light-hearted merriment constantly prevailed; and I often thought how few of the many who talk so gravely of patience and resignation to the will of God, could or would understand that cheerfulness is, in fact, but a different way of shewing that resignation.

Our maid, Batilde, knew nothing about the *cuisine* beyond a good *roux* and a bad omelet; and except making a bed, appeared ignorant of all housework—even washing, dusting, or sweeping thoroughly. She, however, did everything we did not do for ourselves, and ironed the linen after a fashion. Tonette washed for us in the little river aforesaid, where she used an incredible quantity of soap, thumping our things with a piece of flat wood upon a great stone, most conveniently, as she observed, placed there for the purpose 'by the saints in heaven'; which method, if it hastened its wearing out, made our linen at least sweet and clean while it lasted. My husband shot and cultivated the garden in the respective seasons appropriate to these occupations, whilst I bought a cookery-book called '*Les Expériences de Mademoiselle Marguerite*,' and pretending to be learning myself, taught Batilde to prepare our food a little better, without hurting her self-conceit, of which she possessed more than the average of her countrywomen. Our time, therefore, was fully occupied. Our health improved and our spirits rose with the excitement; we had agreeable society in the excellent people named above, meeting *sans façon*, taking breakfast or luncheon with each other, instead of dinners, in winter, and in summer often spending the evening at one another's houses.

At a distance not innumerable there was an English chapel; but the character of the clergyman was not of a kind to recommend itself to persons who had some regard for the decencies of life; and so we contented ourselves with saying our prayers at home. The old curé of the place, with whom we became slightly acquainted, seemed to be a worthy sort of man, liberal in his ideas, and possessed of a considerable taste for music. He made rather an agreeable and obliging neighbour.

Talking of curés, I may mention that one came from a distance of several miles to pay his respects to us, and offer welcome to France. He said, he desired to make our acquaintance because we came from England, where he had found 'rest for twenty years, and received much kindness.' He was a rich man, had a pretty little church, a picturesque house in a sort of park, which he had stocked with pigs instead of

sheep; and every day that was not one of fasting or abstinence, he had pork for dinner. He took a great fancy to us, and wanted us to give up our cottage, and come and live with him, as he had plenty of room and desired society; but we declined. Had we done so, I doubt not that he would have left us his money, for he had no relations, and bequeathed the whole, for want of an heir, to his grocer. He grew cooler after our refusal, but still sometimes came to see us on a pot-bellied cart-horse—a most stolid-looking beast, but one which often took most laughably strange fits of friskiness. Once I saw the good curé's watch jump out of his pocket, fly over his head, and disappear amid a heap of nettles, where little Victor found it, and hoped for a rich reward; but he only received an old book of devotion, and a lecture on the duty of reading it.

I must relate a little adventure which might have been written fifty years ago, when it would have obtained more credence than it will in the present day, from those travellers at least who have kept to the highways, and those residents who have lived only in the towns of France. One morning Batilde asked permission to visit a friend who had come to spend a day with her sister at C—. 'They breed poultry; and as madame likes a goose as soon as the fête of St Michel comes, it would be worth her while to desire Mère Talbot to feed one up against that time. They live a good way off,' pursued she, 'in a poor hamlet called Les Briares. It would be almost worth madame's while to go there some day, for it is such a primitive place, and they are such primitive people.' I liked the idea, and begged Mère Talbot might be told that I would come and look out my goose for myself the following week.

A fine Thursday morning dawned; and as early as we could get coffee made and taken, Batilde and I set out on our expedition, each, after the fashion of the canton, seated on a donkey, our feet in one pannier and a large stone to balance in the other. I took as an offering to the hope and heir of the Talbots a toy much like what we in England call Jack-in-a-box, but in France is termed a *Diabie*, as it is intended to represent his Satanic majesty, and alarm the lifter of the lid by popping up a black visage. The rough roads shaded by high hedges, white and pink with hawthorn, and the wild apple-tree blossom, and redolent of early honeysuckle, reminded me of the secluded parts of England; while Scotland presented itself to my mind when we left these lanes and crossed still, rushy brooks, or dashing tiny torrents, climbed heather braes, pursuing the yellow-hammer and large mountain-bees as they flew on to the furze and broom-bushes, filling the air with their cheerful music; or when, again, we descended to birch-shaded hollows, refreshing ourselves from clear little spring-wells, that sparkled over white pebbles at the foot of a gray rock tufted over with blueberry and foxglove leaves. The poor thing chatted away like a child, inspired by the pure air, bracing, yet mild, and lost herself amongst recollections of her country home, talking of buttercups, hedge-sparrows' eggs, and *démouilles* or dragon-flies.

Several happy hours we spent *en route*; and at last, on turning down from a hilly road, we saw on a flat brown plain a collection of low cottages. The nearer we approached, the more Scotch everything appeared; in some cases I even saw my dear native 'middens afore the door,' the aspect of the houses and looks of the old women especially, with their stoups and country caps—so very like mutches—striped petticoats and short-gowns, brought northern climes before me vividly; and the children stared and shouted like true Scots callants. The very accent was so Scotch that I felt as though I was doing something altogether ridiculous in talking French.

Upon entering Mère Talbot's house, the resemblance became more real. The flags stuck here and there in the earthen floor, the form of the chairs and tables, the press-beds, large red-checked linen curtains, the

'rock and its wee pickle tow,' the reel, the bowls on the shelves—each and all recalled my native country; and I positively should have ended by believing myself there in a dream, if not in reality, had not a glance at the fireplace undeceived me: there was no fire—all was dim, dusky, and dark; no glowing embers and cheerful pipe-clayed hearth, but iron dogs and wood-ashes where blazing coals should be. Even here, however, I could not but think of 'Caledonia stern and wild,' for there stood a real Carron 'three-leggit pat,' to which my very heart warmed. I was asked to sit down; and soon the news spread that *une Anglaise* was to be seen at Mère Talbot's, and people glanced by the window, peeped in at the door, and came to speak upon one pretence or other, as if it was not an everyday sight. By and by a girl and man—whose names from their appearance might have been Jenny and Sawnie—arrived for their dinner—consisting of brown bread, an apple, and cider, which they discussed on their knees—not sitting down at the table—and when finished, returned to their field-labour without speaking. The little boy, meanwhile, had disappeared with his toy-box, which greatly delighted him, and elevated him for the nonce above his fellows; for he was the undisputed possessor of a curiosity imported from England itself, over the sea, by the very lady who was to be seen at his grandmother's house eating pancakes.

The fire was lighted; it crackled and blazed in two minutes; a stand was placed over it, upon which they put what they called a *tuile*; eggs, flour, and milk were mixed, and a bit of butter, the size of a bean in the first instance, of a pea afterwards—*c'est de rigueur*, to hinder every fresh *crêpe* thrown in from burning. Most capital pancakes they were; thin, crisp, hot, and sweet; and the kind people pressed them upon me so hospitably, that I ate till I felt I really could eat no longer, and was glad to finish with a draught of sour cider. I bought seven geese, to be brought to me one at a time, as *fat as caterpillars*, for two francs ten sous each. Mère Talbot was content with her bargain, and so was I with mine. When I rose to take leave, I was reminded again of Scotland, for a large parcel of cakes was put into the off-pannier; and as I should have mortally offended the kind creatures by refusing their gift, I carried them home, toasted them on a fork, and found it made them eat quite as crisp and good as at first. This sketch may appear perhaps very odd to be taken from nature so late as the year 1840, but I can assure my readers it is 'no less strange than true.'

All the summer we wandered about the woods and fields of Flotte, making little excursions in the neighbourhood, and sedulously avoiding the town; but after we had made ourselves acquainted with every beech-shaded hollow, every little fig-forest, every apple-orchard, climbed every broomy knove, gathered heather from the highest rock and mushrooms from the oldest pasture, we turned our steps sometimes towards C—in search of variety. There, every Thursday, the military band of the 44th Regiment played in the alley of the mountain-ash, and there all the dames and demoiselles assembled, dressed in a wonderfully neat way. We asked how these women, who were mostly in humble circumstances, were enabled to dress so finely. Batilde explained the phenomenon.

'Ah! they have infinite merit,' responded the Frenchwoman; 'two of them, whom I chance to know, in order to be enabled to do so, live on eggs and bread, in one room, where they sit, eat, and sleep, nay, sometimes cook; and they have their just reward, for they are universally admired and respected.'

This is a pretty fair specimen of the effort made by Frenchwomen of the humbler orders to maintain a tasteful exterior. To make themselves neat is a principle; and they seem to have an inherent perception of what constitutes taste. They may sometimes

go too far in this direction, and think more of dress and ornaments than they should do. One can at least say, that they are on the safe side. Better to love outward show, than, as is often visible in Scotland, have no regard for appearances. Better cleanliness on any terms than utter slovenliness. I really must say, we saw some most creditable efforts in France to maintain self-respect, among the female population.

About this time, an old gentleman, who was distantly related to us, died—without having, however, an idea of the extent of our poverty—leaving my husband L.50 for a ring. Here was riches—unexpected riches! and I verily believe few who succeed to L.50,000 ever felt more or as much rapture as we did; and we spent an evening very happily settling how we should employ the money. In the first place, we hired a good servant for L.8! and dismissed Batilde; we then, by paying half, induced the landlord to lath, plaster, paper, and paint the large lumber-room, and open a door of communication into the passage, by which we avoided entering through the kitchen. Our late sitting-room we dined in, and made the dining-room a dressing-room; got several small comforts besides; and though last not least, hired an old piano; and every evening enjoyed music in a degree none but real lovers of that delightful art, long deprived of it, can have the slightest conception of—and all this happiness and comfort for L.50! Think of that, ye ladies who give as much for a gown!

Our new servant, Olive, was as clean, orderly, and active as our late one had been the reverse. The difference it made in our comfort was as great as if we had had our former establishment restored, and really our *bonne* was a host within herself. The house was always clean, but we never saw her cleaning: she went to market, baked all our bread, yet never seemed oppressed with work: her cookery was capital; she made excellent dishes out of what Batilde would have wasted: went to mass every morning, and was back in time to prepare everything for our breakfast. After staying a month, she begged permission to leave the cockloft and bring her 'effects' to the gate-house, which we willingly permitted; and her wardrobe was worth a journey to see, when we remembered that her wages had never been quite L.8 until she came to us, and her age only thirty. I shall give the list I copied, hoping some of our English Betties may read and profit by her example: twenty-four good strong linen shifts, made and marked neatly by herself; two dozen worsted and thread stockings, knit by herself; twelve pocket-handkerchiefs; six stout petticoats; four flannel do.; six pair of shoes; eight caps; eight neck-frills; umbrella; prayer-book; gold earrings and cross—which two last, with a beautiful lace-cap, she inherited, but everything else was of her *own earning*. She bought a wardrobe and bedstead, and was by degrees getting furniture; and as I exacted no sewing, every leisure moment she was spinning her future sheets. With all this she was also very kind to a married sister, who had a large family; but she wore no flowers, flounces, nor finery; her six gowns were of a stuff the Scotch call linsey-woolsey; and so in sixteen years' services she had amassed what I have just described. Why can't our girls do as much where wages are higher and clothes cheaper?

We spent three years in this happy solitude, and felt almost sorry when an unexpected legacy, and the settlement of our affairs together, enabled us to return to all the comforts and many of the luxuries of life. It gives me much pleasure to record the many kindnesses we received from all ranks of people. Upon one occasion we were forced to ask the butcher to wait three months longer for his bill: he not only consented, but his wife insisted upon lending us money, and was quite cross when we gratefully declined her kindness. Near the time of our departure, as we were paying a large account, the shopkeeper said: 'At this time you

must have many calls upon you; transmit me the amount from England, for I can afford to wait.' Another of our tradesmen, a shoemaker, was a most singular character—a great physiognomist, and would not serve those he did not like. A dashing English family wished to employ him, but he fought shy, and made himself so disagreeable that they went to another: he told me this before his wife, who seemed annoyed at his conduct. He explained that he did not like their appearance, and was sure they would not pay for what they had. He was right; they left the place in debt to his *confère* and everybody else. I rejoice in this opportunity of assuring my countrymen that there is as much true kindness to be met with in France as in England, and the selfishness we complain of in our neighbours on the other side of the Channel, is often but a preconceived fancy, or induced by our own cold behaviour. The above true sketch shews at least that we met with substantial kindness, and I hope it also proves that we are sensible of it.

PHANTOMS OF THE FAR EAST.

THE form assumed by superstition in India is not very different from the European type, otherwise than in a certain exaggeration, impressed on it, no doubt, by the grotesque grandeur of the mythology. Witchcraft is pretty nearly the same in both regions—the old women being the chief professors of the art; but in many districts of the former country, the evil power is bestowed upon every old woman without exception. Girls will not marry into a family without a witch, for how could their infants be protected from the spells of the other old women? It is dangerous to jostle an old woman on the street, however accidentally, lest she take vengeance on the spot. A man came into this unpleasant contact while he was walking along, carelessly chewing a piece of sugar-cane; and hearing the muttered oburgations of the hag, as he turned round to apologise, he was not surprised to find the juice of the cane turned into blood. The spectators, likewise, recognised the metamorphosis as soon as it was pointed out to them; and when the terrified victim instantly leaped on his horse, and put ten or twelve miles between him and the sorceress before drawing bridle, he was believed to have saved his life by this dispatch.

The operations of the men-sorcerers are less spontaneous and more scientific. They set about their work in a business-like way; and within sight of the house of their intended victim the mystic caldron begins to boil and bubble. The victim, however, is not to be terrified out of his senses. What are his enemy's fires and incantations to him? He will only just take no notice, and continue to live on as if there was not a sorcerer in the world. But that smoke: it meets his eye the first object every morning. That ruddy glare: it is the last thing he sees at night. That measured but inarticulate sound: it is never out of his ear. His thoughts dwell on the mystical business. He is preoccupied even in company. He wonders what they are now putting into the pot; and whether it has any connection with the spasm that has just shot through him. He becomes nervous; he feels unwell; he cannot sleep for thinking; he cannot eat for that horrid broth that bubbles for ever in his mind. He gets worse, and worse, and worse. He dies!

But this empire of the imagination is beaten hollow in Java, where it is supposed that a housebreaker, by throwing a handful of earth upon the beds of the inmates, completely incapacitates them from moving to

save their property. And this is no mere speculative belief, but an actual fact. The man who is to be robbed, on feeling the earth fall upon him, lies as motionless as if he was bound hand and foot. He is under a spell; a spell which, in our own country, even knowledge and refinement have power only to modify.

In England, there is a large class of persons who believe that a certain pill is able to cure all diseases, however opposite their natures, and however different the constitutions of the patients. It is in vain the analytical chemist describes publicly the component parts and real qualities of the quack medicine—their faith is unshaken. In India, this low and paltry credulity acquires a character of the poetical; for there the popular confidence reposes—not more irrationally—on the prayers and incantations of the practitioner. But this sort of practice, in the wilder parts of the country, renders the medical profession somewhat unsafe to its professors; for the doctor is looked upon as a wizard, with power to cure or kill as he chooses. In such places—the jungly districts—there are diseases of the liver and spleen, to which the children, more especially, are subject; and when so affected, the patient pines away and dies without any external token of disease. This result is, of course, attributed to preternatural means; and if there is not an old woman at hand obnoxious to suspicion, the doctor is set down as the murderer. 'I have in these territories,' says Colonel Sleeman, 'known a great many instances of medical practitioners being put to death for not curing young people for whom they were required to prescribe. Several cases have come before me as a magistrate, in which the father has stood over the doctor with a drawn sword, by the side of the bed of his child, and cut him down, and killed him the moment the child died, as he had sworn to do when he found the patient sinking under his prescriptions.'

Another superstition of the country, originating no doubt in local circumstances, found its way into Europe, where no such circumstances existed. In India, a man suddenly vanishes. His family, perhaps, are expecting him at home, but from that moment he is never more heard of. He has been destroyed in the jungle by a tiger, and his remains so completely devoured by other animals, that there is scarcely a relic of his body left to give assurance of a man, far less as a proof of his identity. These mysterious disappearances, however, are connected with their real cause; and men are believed to be frequently metamorphosed—sometimes voluntarily, sometimes involuntarily—into tigers. The voluntary transformation is effected merely by eating a certain root, whereupon the man is instantly changed into a tiger; and when tired of his new character, he has only to eat another, when, *præsto!* he subsides from a tiger into a man. But occasionally mistakes happen. An individual of an inquiring disposition once felt a strong curiosity to know what were the sensations attendant on such a transformation; but being a prudent person, he set about the experiment with all necessary precaution. Having provided himself with

—the insane root

That takes the reason prisoner,

he gave one likewise to his wife, desiring her to stand by and watch the event, and as soon as she saw him fairly turned into a tiger, to thrust it into his mouth. The wife promised, but her nerves were not equal to the performance. As soon as she saw her husband fixed in his new form, she took to flight—carrying in her hand, in the confusion of her mind, the root that would have restored him to her faithful arms! And so

it befell that the poor man-tiger was obliged to take to the woods, where for many a day he dined on his old neighbours of the village, till he was at length shot, and recognised! In this superstition will be seen the prototype of the wolf-mania of mediæval Europe. In Brittany, men betook themselves to the forests in the shape of wolves, out of a morbid passion for the amusement of howling and ravening; but if they left in some secure place the clothes they had thrown off to prepare for the metamorphosis, they had only to reassume them in order to regain their natural forms. But sometimes a catastrophe like the above occurred: the wife discovered the hidden clothes, and carrying them home in the innocent carelessness of her heart, the poor husband lived and died a wolf.

The Hindoos, like other ancient peoples, predict good or evil fortune from certain phenomena of nature; but one instance of this has been described to us in a communication from our Old Indian, which far excels in the poetical the finest fancies of the Greeks. We cannot undertake to say that the thing is new, although we ourselves never heard of it before; but as the knowledge of it was imparted to her by her moonshee as a profound secret, we present it as such to our readers, recommending them to make the experiment for themselves. At the initiation of our informant, she was about to undertake a distant journey, and the old moonshee was anxious to consult the fates as to the fortunes that might be in store for his beloved mistress. He, accordingly, prevailed upon her to walk forth one night from the veranda, and with many quaint expressions of respect and anxiety, besought her to follow his directions with an attentive mind, abstracted as much as possible from the common thoughts of life.

It was a clear, calm night; the moon was full, and not the faintest speck in the sky disturbed her reign. The Ganges was like a flood of silver light, hastening on in charmed silence; while on the green smooth sward on which they walked, a tall shrub, here and there, stood erect and motionless. The young lady, whose impressions were probably deepened by the mystical words of the moonshee, felt a kind of awe stealing over her: she looked round upon the accustomed scene, as if in some new and strange world; and when the old man motioned her to stop, as they reached an open space on the sward, she obeyed with an indescribable thrill.

'Look there,' said he, pointing to her shadow, which fell tall and dark upon the grass. 'Do you see it?'

'Yes,' said she faintly, yet beginning to be ashamed. 'How sharply defined are its edges! It looks like something you could touch.'

'But look longer—look better—look steadfastly. Is it still so definite?'

'A kind of halo begins to gather round it: my eyes dazzle!'

'Then raise them to the heavens; fix them on yonder blue sky. What do you see?'

'I see it still! But it is as white as mist, and of a gigantic size.'

'Has it a head?' asked the moonshee in an anxious whisper.

'Yes; it is complete in all its parts: but now it melts—floats—disappears.'

'Thank God!' said the old man: 'your journey shall be prosperous—such is the will of Heaven!' The experiment was tried on many other occasions by the young lady, and always with similar success, although never without a certain degree of trepidation, even after she had learned that the spectral appearance in the heavens was nothing more than the picture retained on the retina of the eye. She never saw the phantom without a head, which accounts for her being alive to this day; or even wanting a limb, although she has not been without her share of the trials of the world. It can easily be conceived, however, that certain

conditions of the atmosphere may produce these phenomena, which are regarded by the Hindoo seer as sure tokens of death or disaster.

This superstition is not more unreasonable than the mistakes of our early travellers, who were accustomed to attribute a meaning to the phenomena of nature, of which more accurate knowledge has entirely stripped them. But the notions of the Hindoo are always peculiar—his fancy, even in its wildest excursions, is bounded by the circle of his mythology. When our Old Indian's wanderings led her to Pinang, in the Straits of Malacca, she found a Hindoo convict there, trembling even in his chains as his fancy connected the wonders of the place with the dogmas in which he had been reared. This most beautiful island, as our readers may remember, came into the possession of an Englishman in the latter part of last century in rather a romantic way—forming the dowry of a native princess, the daughter of the king of Quedah, whom he married. Captain Light transferred it to the East India Company, who were not slow in discovering the advantages of its fine harbour, rich soil, and salubrious climate. Its inhabitants at that time were a few fishermen on the coast; and the interior was covered with an almost impervious forest; but now there is a population of Europeans and Americans, and Asiatics of almost all countries; and plantations of sugar, coffee, pepper, and other intertropical produce. Among the inhabitants are invalids, who proceed thither from continental India for the restoration of their health; and convicts, who are compelled to compensate by their labour the injuries they have inflicted on society.

The man alluded to belonged to the latter class, having probably travelled for his country's good from the tamer lowlands of Bengal; and when the traveller asked him how he liked the region, he expressed the utmost awe, united with the bitterest condemnation of the Europeans, for desecrating by their roads and other works a place so obviously the abode of deities and spirits. He said, that when they had begun to carry the up-hill road through these primeval forests, they were warned of their impiety by the voices of the gods themselves, in bursts of unearthly music, blasts of the trumpet, and the clash of cymbals and gongs.

'The first tree we struck with the axe,' added he with a shudder, 'ran milk; and the second, blood!' Of these two substances, the former is still more ominous in the Brahminical faith than the latter, for everything connected with the cow is sacred and mysterious.

'Well,' said the inquirer, 'what happened—since in spite of these omens you persisted in your task? Did the gods take vengeance?'

'Yes,' said he solemnly; 'but we were only instruments, like the axes in our hands; and the vengeance, therefore, fell upon the prime mover. The governor'—coming close up to the lady, and putting his mouth to her ear—'the governor died!' Now, all this was true—music, milk, blood, and death; and yet none of these was more the work of supernatural agency than any of the common circumstances of life.

The supposed unearthly sounds proceed neither from birds nor men, and the effect is either pleasing or awful, according to the mood of the listener. Some, in such circumstances, instead of receiving impressions of awe, like the Hindoo convict, would exclaim:

Where should this music be—if the air, or the earth?

It sounds no more: and sure it waits upon

Some god of the island.

And again:

—The isle is full of noises,
Sounds, and sweet airs, that give delight and hurt not.
Sometimes a thousand twangling instruments
Will hum about mine ears; and sometimes voices,
That, if I then had waked after long sleep,
Will make me sleep again.

One would think Shakspeare had actually been in some tropical forest when the daylight began to fade, and the myriads of insects to take up their evening-song! One of these extraordinary musicians is distinguished as the trumpeter; another produces a tinkle like a bell; and a third gives forth a sound which the imagination may ascribe to any instrument, or band of instruments, it pleases. This species of cricket buries himself in a centre, to which converge seven holes, which he has drilled in a circle; and from these seven tubes a sound rushes forth, which almost stuns the passer-by. It may be conceived, therefore, that a forest peopled with myriads upon myriads of such 'executants,' must have a strain for every ear, every mood, and every conscience.

The tree which welled forth milk when struck by the axe was the *Ficus elastica*—a sort of gigantic vine, as thick as a man's arm, which creeps along the ground, sending forth new roots from the joint, and, climbing at length some lofty tree, expands in branches. This is the chief caoutchouc-plant, and its sap has not only the colour, but many of the chemical properties of animal milk, and is frequently drunk as food. The blood came from one of the *eucalypta*, popularly called the blue gum-tree. The governor did die soon after his arrival on the island, and no doubt immediately after he had disturbed, in the manner related, the *genius loci*.

Pinang contains about 160 square miles of surface, nearly the whole of which is laid out in hills and dales, the loftiest of the former reaching a height of 2500 feet above the sea-level. On the slopes of this hill are built the governor's rural residence, and a bungalow, where invalids resort for country air. It is possible that great changes may have taken place here of late years, when efforts have been made to dot the island with sugar-plantations; but at the time we speak of, this was a solitary spot, behind which dark forests stretched upwards to the summit. Among these forests, on the shoulder of the hill, there occurs an optical phenomenon, not unknown in Europe, which is here an object of superstitious terror to the natives.

The first European who observed it was a gentleman who, taking advantage of the coolness of the hour, had strolled away in the early morning from the inhabited district, and was skirting round a deep valley, dotted at the bottom, and overhung at the sides with lofty trees. The beams of the sun had already begun to acquire some power, although his disk was scarcely yet above the horizon; and the traveller watched with interest the effect of the dawning light upon a sea of vapour which nearly filled the valley. This slowly-moving cloud, as it was acted upon by the sun, swelled higher and higher, and became whiter and whiter, till it finally settled, filling the whole valley with a substance that looked like alabaster, in the midst of which the topmost branches of the tall trees hung motionless. The scene was strangely beautiful; and the spectator, who was screened from the now risen sun by a belt of forest, lingered for awhile to contemplate it. When at length he resumed his walk, and, emerging from the trees, found himself in the full blaze of the rising sun, he turned once more to observe the effect on the vapour; and a cry of wonder which arose to his lips was only repressed by a feeling of awe, as he saw upon that alabaster surface a dark human figure of gigantic dimensions, surrounded by a halo that seemed formed of the rainbow. A confused rush of associations half acquainted him at the moment with the nature of the phenomenon; but giving way to the feeling of poetical delight, he clasped his hands above his head in admiration—a movement which the Phantom of the Alabaster Valley instantaneously imitated! It was indeed his own shadow—and a shadow he was not to recall, even when he turned away to journey homewards. There, in that lonely place, it seemed to him to remain for

ever—a link connecting him with the spirit of nature, and ever and anon drawing him back into her domain from the meanness, and folly, and wickedness of the world.

DECIMAL SYSTEM OF WEIGHTS AND MEASURES.

THE state of our national weights and measures has been a fertile subject of legislative enactment ever since the signing of the Magna Charta, which proclaims that 'there shall be one weight and one measure.' 'We will and establish,' said an act of Edward III. nearly 500 years ago, 'that one weight, one measure, and one yard, be used throughout the land.' Act has followed act from that time to this, and still we have not only different weights and measures for different commodities, but for the same in different parts of the realm. An ounce means one thing to the grocer, another to the apothecary. A stone is 8 pounds to the London butcher or fishmonger, 14 to the provincial; 5 pounds to the dealer in glass, 16 to the cheesemonger, and 32 to the dealer in hemp. The corn-trade exhibits still greater varieties. Prices are quoted in official circulars in every fashion, from the Mark-Lane quarter to the Scotch boll, the fliriot, the load (which may be of various dimensions), the coomb, the last, the barrel (which also may be various), the ton, the hundredweight, and the pound. We have seen an extract from an actual account-sales, by which it appeared, that at the same port the merchant had sold a cargo of foreign wheat by five different bushels according to the customs of the buyers. In paying the duty, these various bushels had to be converted into imperial quarters, and in calculating tonnage and other dues, it was necessary to reduce all to tons! Here is surely a source of endless confusion, if not an opening for fraud. Our legislature has gone on from century to century, mending or mutilating the statutes as the case might be, but laying down no principles scientific enough to command the approval of the educated, or simple enough to prevail over the established usages of the commonalty.

Our neighbours in France, who are particularly fond of framing theories and experimenting on them for the edification of other nations, availed themselves of the general upturning of affairs in 1789, to introduce a universal decimal system, to be applied to everything whatever that could be counted, weighed, or measured. They started from the measurement of the globe itself, and took as the basis of their whole system the ten-millionth part of a quadrant of a meridian, equal to 39,370,790 inches English. This they called a *mètre* (measure), and to it, as a unit, they prefixed the Greek numerals to express increase in the decimal ratio; thus decamètres, tens of meters; hectamètres, hundreds of meters; and so on. To express diminution in the decimal ratio, they used the Latin numerals; thus, decimètres, tenths of meters; centimètres, hundredths of meters; millimètres, thousandths of meters. The unit adopted for square measure was the *are*, equal to 100 square meters; for solid measure, the *stère*, equal to one cubic meter; and for measure of capacity, the *litre*, a cubic decimeter. The weights were derived from these measures; the *gramme* being the weight of one cubic centimeter of distilled water. The system of decimal gradation was applied to all of these; that is, each denomination represented a tenth part of the one above it, and ten times as much as the one next below it, the Latin and Greek numerals being prefixed as we have already described with reference to the meter. In conformity with this decimal law, the quadrant was divided, for astronomical purposes, into 100 degrees instead of 90; and the thermometer likewise into 100 degrees from the boiling to the freezing point. At the same time, a system of reckoning money by tens was introduced; and it must be owned, that the whole

system of computation in weights, measures, and money established in France at this period, is one of the greatest triumphs of civilisation. In ordinary transactions, old denominations of money are still used by the French; the *sous*, in particular, being apparently ineradicable. But in book-keeping, the furnishing of accounts, and in literature, the modern and legal standards are invariably adhered to.

About thirty years ago, the Americans took it into serious consideration whether they should adopt the ready-made scale of France entire. On that occasion (1821), Mr John Quincy Adams produced a most elaborate report to Congress, containing an immense amount of information on the subject of metrology. He found great fault with the French nomenclature, so puzzling to the unlearned. 'Give the people,' said he, 'but their accustomed words, and they will call 16 a dozen; 120, 112, or any other number, a hundred.' He disapproved, likewise, of thrusting the decimal principle upon things incompatible with it. 'Decimal arithmetic,' said he, 'is a contrivance of man for computing numbers, and not a property of time, space, or matter. It belongs essentially to the keeping of accounts, but is merely an incident to the transactions of trade. Nature has no partiality for the number 10; and the attempt to shackle her freedom with them [decimal gradations], will for ever prove abortive.' And again: 'To the mensuration of the surface and the solid, the number 10 is of little more use than any other. If decimal arithmetic is incompetent to give the dimensions of most artificial forms, the square and the cube, still more incompetent is it to give the circumference, the area, and the contents of the circle and the sphere.' And once more: 'The new metrology of France, after trying the principle of decimal division in its almost universal application, has been compelled to renounce it for all the measures of astronomy, geography, navigation, time, the circle, and the sphere; to modify it even for superficial and cubical linear measure.' The conclusion of the Americans was, that it was better to continue the use of the system of weights and measures inherited from the father-land. Partly on account of our intimate commercial relations with them, they are content to wait, and allow us to take the lead in the work of reform.

Taking our stand on the ground of mere practical utility, according to the views suggested, we do not advocate any interference with the foot, the rood, the acre, the mile, which would lead to the removal of old landmarks, and would render almost every chart and map and book in the country obsolete. But we suggest that the time has arrived when our national weights and measures may be finally adjusted on simple and scientific principles. Within the last thirty years, a principle that goes far towards clearing our way has been laid down, and in part carried into practice. By an act of the British legislature, which came into operation on the 1st January 1826, our standards were accurately adjusted, and certain rules were laid down, by which they could be restored if lost; while the uniform use of these in the business of the country was strictly enjoined. The imperial yard, which is the basis of the whole, is to be found in the following manner:—'Take a pendulum, vibrating seconds of time, in the latitude of London, in vacuum and at the level of the sea; divide all that part thereof which lies between the axis of suspension and the centre of oscillation into 391,393 equal parts; then will 10,000 of these parts be an imperial inch, 12 whereof make a foot, and 36 whereof make a yard.' All other measures of linear extension are to be computed from this. Thus, 'the foot, the inch, the pole, the furlong, and the mile, shall bear the same proportion to the imperial standard yard as they have hitherto borne to the yard measure in general use.' For the determination of weights, take a cube of an imperial inch of distilled water at 62

degrees Fahrenheit; let this be weighed with any weight, and let such weight be divided into 252,458 equal parts; then will a thousand of such parts be a troy grain, of which 5760 make a pound troy, and 7000 a pound avoirdupois.

'This troy-weight,' said the commissioners, 'appeared to us to be the ancient weight of this kingdom, having existed in the same state from the time of Edward the Confessor.' 'We were induced, moreover,' said they, 'to preserve the troy-weight, because all the coinage has been uniformly regulated by it, and all medical prescriptions and formulæ have always been estimated by troy-weight, under a peculiar subdivision which the college of physicians have expressed themselves most anxious to preserve.' It was resolved, therefore, to continue the use of troy-weight for drugs, bullion, &c. and to raise the avoirdupois on its basis. The commissioners went on to say: 'The avoirdupois pound, by which all heavy goods have been for a long time weighed, seems not to have been preserved with such scrupulous accuracy as the troy, by which more precious articles have been weighed;' but it was so nearly equivalent to 7000 grains troy, that they determined this should be its standard for the future. Measures of capacity were to be based upon this weight, and not, as heretofore, on cubic inches. Ten lbs. avoirdupois of distilled water weighed in air at the temperature of 62 degrees Fahrenheit, and the barometer at 30 inches, were henceforth to determine the imperial gallon, to the utter abolition of three distinct gallons for wine, ale, and corn, based respectively on the specific bulk and gravity of Bordeaux wine, English ale, and grains of wheat. All other measures were to be taken in parts or multiples of the said imperial standard gallon, according to the proportions hitherto in use. A great reform in this connection, was the obligation of dealers to sell most solid commodities—as coal, bread, potatoes, &c.—by weight and not by measure, which had been liable to great abuses. Corn, however, was not included in this provision; nor has even the use of the imperial bushel been universally enforced where it interfered with the long-established usages of corporate bodies.

To carry thus far into effect these newly-established measures, required no common exercise of authority. Every dealer, wholesale or retail, was obliged to have his weights verified and stamped. The brewer was compelled to get new casks; the retailer new pots and pints; the farmer new bushels, and, consequently, new corn-sacks. The expense thus incurred was enormous, and the grumbling was of course in due proportion.

It is believed that the units above mentioned—the yard, the pound avoirdupois, and the imperial gallon—cannot now be superseded by any other. It remains to shew, as Mr Taylor has very satisfactorily done,* how that which has been well begun may be followed out and completed by the establishment of more complete uniformity, and the legalisation of decimal gradations for facilitating calculation.

The two co-existing pounds originally adjusted in relation to the specific gravities of wheat and spring-water, are now the sole remains and representatives of a fanciful theory spun in the middle ages; and the first question that occurs is, whether the pound troy, having served its purpose, might not be done away with, and the pound avoirdupois ascertained by reference to a cubic inch of distilled water. We were told forty years ago, that for the introduction of a uniform and scientific system, we must wait for the spread of education in the community; and we feel somewhat ashamed now to find that the members of the medical profession, which is understood to be one of the most highly-educated bodies, offer the most formidable opposition to reformation in this respect. 'The testimony,

* *The Decimal System*. By Henry Taylor. London: Groombridge & Sons.

however,' says Mr Taylor, 'of many individuals of the medical profession, especially the younger portion, and certainly that of the retailers and dispensers of drugs, tends entirely to shew the practicability of a beneficial and convenient change. With all these, there appears no more serious difficulty to encounter than that involved in altered editions of their usual dispensatories, or books of reference'—an amount of trouble and expense, we should say, not greater, certainly, in proportion to the position of the parties concerned, than that which was forced on the poor chandlers and milkwomen by the act of 1826.

Then, to adapt the *avoirdupois* pound to the further objects in view, it must be reconstructed as to its divisional parts. In order to this, it is not necessary that the nomenclature should be changed, or that our poor people should be puzzled with the *decas*, and *hexas*, and *millias* which has formed the greatest practical difficulty in the decimal system of France. It is proposed simply to divide the pound *avoirdupois* into 10,000 parts instead of 7000, and to employ names at present in use for the minor denominations; but if it be thought incongruous to retain the term *grain*, which had reference to the weight of wheat or barley, *minim* might be substituted. Then the multiples of the pound, which have hitherto been so various, are to be decimally graduated—*as*, stones of 10 lbs., cwt. of 10 stone (or, literally, 100 lbs.), and tons of 10 cwt. The decimal measures below the gallon would correspond of course with the weights, as it is decided by the act, that a gallon is to contain ten pounds of water. The measures above gallons, it is proposed to call *firkins* and *butts*.

It is taken for granted that quarts and pints, as well as half-pounds and quarter-pounds, would still be continued in use. In France, the government was obliged to relax its decimal principles in favour of permitting a partial return to the binary mode of subdivision. Mr Adams, who is high authority on such a point, avers that such divisions are 'as necessary to the practical use of weights and measures, as the decimal divisions are convenient for calculations resulting from them.' If this be admitted, almost the only change to retailers of ordinary commodities would be the introduction of the new ounce weight, altered to the tenth of a pound, with price in correspondence; and perhaps the fluid pound, or tenth of a gallon. If, however, the latter were likely to be generally used by the masses, it would be desirable that it should bear a more familiar name. But probably it would be little known, except as the highest denomination generally used by the apothecary; in which case the nomenclature would be all the better for expressing the value of the measure scientifically in relation to distilled water, as is now usually done by this class.

It is easy to shew the practical advantages that would result in mercantile calculations if such a scale were adopted, and especially in connection with the decimal system of money advocated in a former number of this Journal.* If a parcel of goods weighs 18 cwt., 7 stone, 8 lbs., and it be desired to know how many pounds it contains, it is unnecessary to change a single figure to shew that there are 1878; an additional cipher gives the number of ounces (187,80); another the number of drachms (187,800), instead of requiring the present tedious process of reduction. Again: if any commodity costs, for instance, 2 fl. 3 cents per lb., we know without taking up a pen that it is 2 cents 3 mil. per ounce; that it is L.2, 8 fl. per stone; L.28 per cwt.; L.280 per ton; and so on. Here is a cargo—no matter of what—weighing 874 tons, 7 cwt. 4 st. If the value is, for instance, L.2, 8s. per ton, we have but to multiply the figures 87474 by 28, and point the amount thus—L.8619.0.2. If, however, the price be L.2, 8s. per cwt., the point after the pounds, which is the only essen-

tial one, must be removed a step further to the right—thus, L.8619.0.2; and if L.2, 8s. per stone, it will be L.86190.2. Let any one try the difference between these operations and similar calculations according to our present system, and he will confess it is no mean advantage that the advocates of decimal gradations are seeking to obtain for the community.

We are happy to add, that since our article on Decimal Coinage appeared, we have received numerous communications on the subject; and while there are minor differences of opinion as to the details, there appears to be perfect unanimity as to the desirableness of the system, and the possibility of bringing it into general use.

THE LITTLE GRAY GOSSIP.

Soon after Cousin Con's marriage, we were invited to stay for a few weeks with the newly-married couple, during the festive winter season; so away we went with merry hearts, the clear frosty air and pleasant prospect before us invigorating our spirits, as we took our places inside the good old mail-coach, which passed through the town of P—, where Cousin Con resided, for there were no railways then. Never was there a kinder or more genial soul than Cousin Con; and David Danvers, the Goodman, as she laughingly called him, was, if possible, kinder and more genial still. They were surrounded by substantial comforts, and delighted to see their friends in a sociable, easy way, and to make them snug and cosy, our arrival being the signal for a succession of such convivialities. Very mirthful and enjoyable were these evenings, for Con's presence always shed radiant sunshine, and David's honest broad face beamed upon her with affectionate pride. During the days of their courtship at our house, they had perhaps indulged in billing and cooing a little too freely when in company with others, for sober middle-aged lovers like themselves; thereby lying open to animadversions from prim spinsters, who wondered that Miss Constance and Mr Danvers made themselves so ridiculous. But now all this nonsense had sobered down, and nothing could be detected beyond a sly glance, or a squeeze of the hand now and then; yet we often quizzed them about by-gones, and declared that engaged pairs were insufferable—we could always find them out among a hundred!

'I'll bet you anything you like,' cried Cousin Con, with a good-humoured laugh, 'that among our guests coming this evening' (there was to be a tea-junketing), 'you'll not be able to point out the engaged couple—for there will be only one such present—though plenty of lads and lasses that would like to be so happily situated! But the couple I allude to are real turtle-doves, and yet I defy you to find them out!'

'Done, Cousin Con!' we exclaimed; 'and what shall we wager?'

'Gloves! gloves to be sure!' cried David. 'Ladies always wager gloves; though I can tell you, my Con is on the safe side now;' and David rubbed his hands, delighted with the joke; and we already, in perspective, beheld our glove-box enriched with half-a-dozen pair of snowy French sevens!

Never had we felt more interested in watching the arrivals and movements of strangers, than on this evening, for our honour was concerned, to detect the lovers, and raise the veil. Papas and mammas, and masters and misses, came trooping in; old ladies, and middle-aged; old gentlemen, and middle-aged—until the number amounted to about thirty, and Cousin Con's drawing-rooms were comfortably filled. We closely scrutinised all the young folks, and so intently but covertly watched their proceedings, that we could have revealed several innocent flirtations, but nothing appeared that could lead us to the turtle-doves and their engagement. At length, we really

* See No. 428.

had hopes, and ensconced ourselves in a corner, to observe the more cautiously a tall, beautiful girl, whose eyes incessantly turned towards the door of the apartment; while each time it opened to admit any one, she sighed and looked disappointed, as if that one was not the one she yearned to see. We were deep in a reverie, conjuring up a romance of which she was the heroine, when a little lady, habited in gray, whose age might average threescore, unceremoniously seated herself beside us, and immediately commenced a conversation, by asking if we were admiring pretty Annie Mortimer—following the direction of our looks. On receiving a reply in the affirmative, she continued: 'Ah, she's a good, affectionate girl; a great favourite of mine is sweet Annie Mortimer.'

'Watching for her lover, no doubt?' we ventured to say, hoping to gain the desired information, and thinking of our white kid-gloves. 'She is an engaged young lady?'

'Engaged! engaged!' cried the little animated lady: 'no indeed. The fates forbid! Annie Mortimer is not engaged.' The expression of the little lady's countenance at our bare supposition of so natural a fact, amounted almost to the ludicrous; and we with some difficulty articulated a serious rejoinder, disavowing all previous knowledge, and therefore erring through ignorance. We had now time to examine our new acquaintance more critically. As we have already stated, she was habited in gray; but not only was her attire gray, but she was literally gray all over: gray hairs, braided in a peculiar obsolete fashion, and quite uncovered; gray gloves; gray shoes; and, above all, gray eyes, soft, large, and peculiarly sad in expression, yet beautiful eyes, redeeming the gray, monotonous countenance from absolute plainness. Mary Queen of Scots, we are told, had gray eyes; and even she, poor lady, owned not more speaking or history-telling orbs than did this little unknown gossip in gray. But our attention was diverted from the contemplation, by the entrance of another actor on the stage, to whom Annie Mortimer darted forward with an exclamation of delight and welcome. The newcomer was a slender, elderly gentleman, whose white hairs, pale face, and benignant expression presented nothing remarkable in their aspect, beyond a certain air of elegance and refinement, which characterised the whole outward man.

'That is a charming-looking old gentleman,' said we to the gray lady; 'is he Annie's father?'

'Her father! O dear, no! That gentleman is a bachelor; but he is Annie's guardian, and has supplied the place of a father to her, for poor Annie is an orphan.'

'Oh! we exclaimed, and there was a great deal of meaning in our oh! for had we not read and heard of youthful wards falling in love with their guardians? and might not the fair Annie's taste incline this way? The little gray lady understood our thoughts, for she smiled, but said nothing; and while we were absorbed with Annie and her supposed antiquated lover, she glided into the circle, and presently we beheld Annie's guardian, with Annie leaning on his arm, exchange a few words with her in an undertone, as she passed them to an inner room.

'Who is that pleasing-looking old gentleman?' said we to our hostess; 'and what is the name of the lady in gray, who went away just as you came up? That is Annie Mortimer we know, and we know also that she isn't engaged!'

Cousin Con laughed heartily as she replied: 'That nice old gentleman is Mr Worthington, our poor curate; and a poor curate he is likely ever to continue, so far as we can see. The lady in gray we call our "little gray gossip," and a darling she is! As to Annie, you seem to know all about her. I suppose little Bessie has been lauding her up to the skies.'

'Who is little Bessie?' we inquired.

'Little Bessie is your little gray gossip: we never call her anything but Bessie to her face; she is a harmless little old maid. But come this way: Bessie is going to sing, for they won't let her rest till she complies; and Bessie singing, and Bessie talking, are widely different creatures.'

Widely different indeed! Could this be the little gray lady seated at the piano, and making it speak? while her thrilling tones, as she sang of 'days gone by,' went straight to each listener's heart, she herself looking ten years younger! When the song was over, I observed Mr Worthington, with Annie still resting on his arm, in a corner of the apartment, shaded by a projecting piece of furniture; and I also noted the tear on his furrowed cheek, which he hastily brushed away, and stooped to answer some remark of Annie's, who, with fond affection, had evidently observed it too, endeavouring to dispel the painful illusion which remembrances of days gone by occasioned.

We at length found the company separating, and our wager still unredeemed. The last to depart was Mr Worthington, escorting Annie Mortimer and little Bessie, whom he shawled most tenderly, no doubt because she was a poor forlorn little old maid, and sang so sweetly.

The next morning at breakfast, Cousin Con attacked us, supported by Mr Danvers, both demanding a solution of the mystery, or the scented sevens! After a vast deal of laughing, talking, and discussion, we were obliged to confess ourselves beaten, for there had been an engaged couple present on the previous evening, and we had failed to discover them. No; it was not Annie Mortimer: she had no lover. No; it was not the Misses Halliday, or the Masters Burton: they had flirted and danced, and danced and flirted indiscriminately; but as to serious engagements—pooh! pooh!

Who would have conjectured the romance of reality that was now divulged? and how could we have been so stupid as not to have read it at a glance? These contradictory exclamations, as is usual in such cases, ensued when the riddle was unfolded. It is so easy to be wise when we have learned the wisdom. Yet we cheerfully lost our wager, and would have lost a hundred such, for the sake of hearing a tale so far removed from matter-of-fact; proving also that enduring faith and affection are not so fabulous as philosophers often pronounce them to be.

Bessie Prudholm was nearly related to David Danvers, and she had been the only child of a talented but improvident father, who, after a short, brilliant career as a public singer, suddenly sank into obscurity and neglect, from the total loss of his vocal powers, brought on by a violent rheumatic cold and lasting prostration of strength. At this juncture, Bessie had nearly attained her twentieth year, and was still in mourning for an excellent mother, by whom she had been tenderly and carefully brought up. From luxury and indulgence the descent to poverty and privation was swift. Bessie, indeed, inherited a very small income in right of her deceased parent, sufficient for her own wants, and even comforts, but totally inadequate to meet the thousand demands, caprices, and fancies of her ailing and exigent father. However, for five years she battled bravely with adversity, eking out their scanty means by her exertions—though, from her father's helpless condition, and the constant and unremitting attention he required, she was in a great measure debarred from applying her efforts advantageously. The poor, dying man, in his days of health, had contributed to the enjoyment of the affluent, and in turn been courted by them; but now, forgotten and despised, he bitterly reviled the heartless world, whose hollow heed of applause it had formerly been the sole aim of his existence to secure. Wealth became to his disordered imagination the desideratum of existence, and

he attached inordinate value to it, in proportion as he felt the bitter stings of comparative penury. To guard his only child—whom he certainly loved better than anything else in the world, save himself—from this dreaded evil, the misguided man, during his latter days, extracted from her an inviolable assurance, never to become the wife of any individual who could not settle upon her, subject to no contingencies or chances, the sum of at least one thousand pounds.

Bessie, who was fancy-free, and a lively-spirited girl, by no means relished the slights and privations which poverty entails. She therefore willingly became bound by this solemn promise; and when her father breathed his last, declaring that she had made his mind comparatively easy, little Bessie half smiled, even in the midst of her deep and natural sorrow, to think how small and easy a concession her poor father had exacted, when her own opinions and views so perfectly coincided with his. The orphan girl took up her abode with the mother of David Danvers, and continued to reside with that worthy lady until the latter's decease. It was beneath the roof of Mrs Danvers that Bessie first became acquainted with Mr Worthington—that acquaintance speedily ripening into a mutual and sincere attachment. He was poor and patronless then, as he had continued ever since, with slender likelihood of ever possessing L.100 of his own, much less L.1000 to settle on a wife. It is true, that in the chances and changes of this mortal life, Paul Worthington might succeed to a fine inheritance; but there were many lives betwixt him and it, and Paul was not the one to desire happiness at another's expense, nor was sweet little Bessie either.

Yet was Paul Worthington rich in one inestimable possession, such as money cannot purchase—even in the love of a pure devoted heart, which for him, and for his dear sake, bravely endured the life-long loneliness and isolation which their peculiar circumstances induced. Paul did not see Bessie grow old and gray: in his eyes, she never changed; she was to him still beautiful, graceful, and enchanting; she was his betrothed, and he came forth into the world, from his books, and his arduous clerical and parochial duties, to gaze at intervals into her soft eyes, to press her tiny hand, to whisper a fond word, and then to return to his lonely home, like a second Josiah Cargill, to try and find in severe study oblivion of sorrow.

Annie Mortimer had been sent to him as a ministering angel: she was the orphan and penniless daughter of Mr Worthington's dearest friend and former college-chum, and she had come to find a shelter beneath the humble roof of the pious guardian, to whose earthly care she had been solemnly bequeathed. Paul's curacy was not many miles distant from the town where Bessie had fixed her resting-place; and it was generally surmised by the select few who were in the secret of little Bessie's singular history, that she regarded Annie Mortimer with especial favour and affection, from the fact, that Annie enjoyed the privilege of solacing and cheering Paul Worthington's declining years. Each spoke of her as a dear adopted daughter, and Annie equally returned the affection of both.

Poor solitaires! what long anxious years they had known, separated by circumstance, yet knit together in the bonds of enduring love!

I pictured them at festive winter seasons, at their humble solitary boards; and in summer prime, when song-birds and bright perfumed flowers call lovers forth into the sunshine rejoicingly. They had not dared to rejoice during their long engagement; yet Bessie was a sociable creature, and did not mope or shut herself up, but led a life of active usefulness, and was a general favourite amongst all classes. They had never contemplated the possibility of evading Bessie's solemn promise to her dying father; to their tender consciences, that fatal promise was as binding and stringent, as if the

gulf of marriage or conventual vows yawned betwixt them. We had been inclined to indulge some mirth at the expense of the little gray gossip, when she first presented herself to our notice; but now we regarded her as an object of interest, surrounded by a halo of romance, fully shared in by her charming, venerable lover. And this was good Cousin Con's elucidation of the riddle, which she narrated with many digressions, and with animated smiles, to conceal tears of sympathy. Paul Worthington and little Bessie did not like their history to be discussed by the rising frivolous generation; it was so unworldly, so sacred, and they looked forward with humble hope so soon to be united for ever in the better land, that it pained and distressed them to be made a topic of conversation.

Were we relating fiction, it would be easy to bring this antiquated pair together, even at the eleventh hour; love and constancy making up for the absence of one sweet ingredient, evanescent, yet beautiful—the ingredient we mean of youth. But as this is a romance of reality, we are fain to divulge facts as they actually occurred, and as we heard them from authentic sources. Paul and Bessie, divided in their lives, repose side by side in the old church-yard. He dropped off first, and Bessie doffed her gray for sombre habiliments of darker hue. Nor did she long remain behind, loving little soul! leaving her property to Annie Mortimer, and warning her against long engagements.

The last time we heard of Annie, she was the happy wife of an excellent man, who, fully coinciding in the opinion of the little gray gossip, protested strenuously against more than six weeks' courtship, and carried his point triumphantly.

THE WET SHROUD.

'Ach, Sohn! was hält dich zurück?'
'Siehe, Mutter, das sind die Thänen.'

MUTTERTHÄNEN.

THEY gave her back again:
They never asked to see her face;
But gazed upon her vacant place,
Moaning, like those in pain.

There was a brief hot thirst;
A thirsting of the heart for streams
Which never more save in sweet dreams
From that lost fount should burst.

There was a frightful cry,
As if the whole great earth were dead;
Yet was one arrow only sped,
One, only, called to die.

Then all grew calm as sleep;
And they in household ways once more
Did go: the anguish half was o'er,
For they had learned to weep.

They stood about her bed,
And whispered low beneath their cloud;
For she might hear them speaking loud—
She was so near, they said.

Softly her pillow pressing,
With reverend brows they mutely lay;
They scarcely missed the risen clay
In her pure soul's caressing.

Last, from their eyes were driven
Those heart-drops, lest—so spoke their fears—
Her robes all heavy with their tears
Might clog her flight to Heaven!

PHILOSOPHY OF LAUGHTER.

From the time of King Solomon downwards, laughter has been the subject of pretty general abuse. Even the laughers themselves sometimes vituperate the cachinnation they indulge in, and many of them

— 'laugh in such a sort,
As if they mocked themselves, and scorned the spirit
That could be moved to laugh at anything.'

The general notion is, that laughter is childish, and unworthy the gravity of adult life. Grown men, we say, have more to do than to laugh; and the wiser sort of them leave such an unseemly contortion of the muscles to babes and blockheads.

We have a suspicion that there is something wrong here—that the world is mistaken not only in its reasonings, but its facts. To assign laughter to an early period of life, is to go contrary to observation and experience. There is not so grave an animal in this world as the human baby. It will weep, when it has got the length of tears, by the pailful; it will clench its fists, distort its face into a hideous expression of anguish, and scream itself into convulsions. It has not yet come up to a laugh. The little savage must be educated by circumstances, and tamed by the contact of civilisation, before it rises to the greater functions of its being. Nay, we have sometimes received the idea from its choked and tuneless screams, that *they* were imperfect attempts at laughter. It feels enjoyment as well as pain, but has only one way of expressing both.

Then, look at the baby when it has turned into a little boy or girl, and come up in some degree to the cachinnation. The laughter is still only rudimental: it is not genuine laughter. It expresses triumph, scorn, passion—anything but a feeling of natural amusement. It is provoked by misfortune, by bodily infirmities, by the writhings of agonised animals; and it indicates either a sense of power or a selfish feeling of exemption from suffering. The 'light-hearted laugh of children!' What a mistake! Observe the gravity of their sports. They are masters or mistresses, with the care of a family upon their hands; and they take especial delight in correcting their children with severity. They are washer-women, housemaids, cooks; soldiers, policemen, postmen; coach, horsemen, and horses, by turns; and in all these characters they scour, sweep, fry, fight, pursue, carry, whirl, ride, and are ridden, without changing a muscle.

At the games of the young people there is much shouting, argument, vituperation—but no laughter. A game is a serious business with a boy, and he derives from it excitement, but no amusement. If he laughs

at all, it is at something quite distinct from the purpose of the sport: for instance, when one of his comrades has his nose broken by the ball, or when the feet of another make off from him on the ice, and he comes down upon his back like a thunderbolt. On such occasions, the laugh of a boy puts us in mind of the laugh of a hyæna: it is, in fact, the broken, asthmatic roar of a beast of prey.

It would thus appear that the common charge brought against laughter, of being something babyish, or childish, or boyish—something properly appertaining to early life—is unfounded. But we of course must not be understood to speak of what is technically called giggling, which proceeds more from a looseness of the structures than from any sensation of amusement. Many young persons are continually on the giggle till their muscles strengthen; and indeed, when a company of them are met together, the affection, aggravated by emulation, acquires the loudness of laughter, when it may be likened, in Scripture phrase, to the crackling of thorns. What we mean is a regular guffaw; that explosion of high spirits, and the feeling of joyous excitement, which is commonly written ha! ha! ha! This is altogether unknown in babyhood; in boyhood, it exists only in its rudiments; and it does not reach its full development till adolescence ripens into manhood.

This train of thought was suggested to us a few evenings ago, by the conduct of a party of eight or ten individuals, who meet periodically for the purpose of philosophical inquiry. Their subject is a very grave one. Their object is to mould into a science that which as yet is only a vague, formless, and obscure department of knowledge; and they proceed in the most cautious manner from point to point, from axiom to axiom—debating at every step, and coming to no decision without unanimous conviction. Some are professors of the university, devoted to abstruse studies; some are clergymen; and some authors and artists. Now, at the meeting in question—which we take merely as an example, for all are alike—when the hour struck which terminates their proceedings for the evening, the jaded philosophers retired to the refreshment-room; and here a scene of remarkable contrast occurred. Instead of a single deep, low, earnest voice, alternating with a profound silence, an absolute roar of merriment began, with the suddenness of an explosion of gunpowder. Jests, bon-mots, anecdotes, barbarous plays upon words—the more atrocious the better—flew round the table; and a joyous and almost continuous ha! ha! ha! made the ceiling ring. This, we venture to say it, *was* laughter—genuine, unmistakable laughter, proceeding from no sense of triumph, from no self-gratulation, and mingled with no bad feeling of any kind.

It was a spontaneous effort of nature, coming from the head as well as the heart: an unbending of the bow, a reaction from study, which study alone could occasion, and which could occur only in adult life.

There are some people who cannot laugh, but these are not necessarily either morose or stupid. They may laugh in their heart, and with their eyes, although by some unlucky fatality, they have not the gift of oral cachinnation. Such persons are to be pitied; for laughter in grown people is a substitute devised by nature for the screams and shouts of boyhood, by which the lungs are strengthened and the health preserved. As the intellect ripens, that shouting ceases, and we learn to laugh as we learn to reason. The society we have mentioned studied the harder the more they laughed, and they laughed the more the harder they studied. Each, of course, to be of use, must be in its own place. A laugh in the midst of the study would have been a profanation; a grave look in the midst of the merriment would have been an insult to the good sense of the company.

If there are some people who cannot laugh, there are others who will not. It is not, however, that they are ashamed of being grown men, and want to go back to babyhood, for by some extraordinary perversity, they fancy unalterable gravity to be the distinguishing characteristic of wisdom. In a merry company, they present the appearance of a Red Indian whitewashed, and look on at the strange ways of their neighbours without betraying even the faintest spark of sympathy or intelligence. These are children of a larger growth, and have not yet acquired sense enough to laugh. Like the savage, they are afraid of compromising their dignity, or, to use their own words, of making fools of themselves. For our part, we never see a man afraid of making a fool of himself at the right season, without setting him down as a fool ready made.

A woman has no natural grace more bewitching than a sweet laugh. It is like the sound of flutes on the water. It leaps from her heart in a clear, sparkling rill; and the heart that hears it feels as if bathed in the cool, exhilarating spring. Have you ever pursued an unseen fugitive through the trees, led on by her fairy laugh; now here, now there—now lost, now found? We have. And we are pursuing that wandering voice to this day. Sometimes it comes to us in the midst of care, or sorrow, or irksome business; and then we turn away, and listen, and hear it ringing through the room like a silver bell, with power to scare away the ill spirits of the mind. How much we owe to that sweet laugh! It turns the prose of our life into poetry; it dings showers of sunshine over the darksome wood in which we are travelling; it touches with light even our sleep, which is no more the image of death, but gemmed with dreams that are the shadows of immortality.

But our song, like Dibdin's, 'means more than it says;' for a man, as we have stated, may laugh, and yet the cachinnation be wanting. His heart laughs, and his eyes are filled with that kindly, sympathetic smile which inspires friendship and confidence. On the sympathy within, these external phenomena depend; and this sympathy it is which keeps societies of men together, and is the true freemasonry of the good and wise. It is an imperfect sympathy that grants only sympathetic tears: we must join in the mirth as well as melancholy of our neighbours. If our countrymen laughed more, they would not only be happier, but better; and if philanthropists would provide amusements for the people, they would be saved the trouble and expense of their fruitless war against public-houses. This is an indisputable proposition. The French and Italians, with wine growing at their doors, and spirits almost as cheap as beer in England, are sober nations. How comes this? The laugh will answer that leaps up from group after group—the dance on the village-green—the family dinner under the trees—the thousand

merry-meetings that invigorate industry, by serving as a relief to the business of life. Without these, business is care; and it is from care, not from amusement, men fly to the bottle.

The common mistake is to associate the idea of amusement with error of every kind; and this piece of moral asceticism is given forth as true wisdom, and, from sheer want of examination, is very generally received as such. A place of amusement concentrates a crowd, and whatever excesses may be committed, being confined to a small space, stand more prominently forward than at other times. This is all. The excesses are really fewer—far fewer—in proportion to the number assembled, than if no gathering had taken place. How can it be otherwise? The amusement is itself the excitement which the wearied heart longs for; it is the reaction which nature seeks; and in the comparatively few instances of a coarser intoxication being superadded, we see only the craving of depraved habit—a habit engendered, in all probability, by the want of amusement.

No, good friends, let us laugh sometimes, if you love us. A dangerous character is of another kidney, as Cæsar knew to his cost:—

'He loves no plays,
As thou dost, Antony; he hears no music;
Seldom he laughs;'

and when he does, it is on the wrong side of his mouth.

Let us be wiser. Let us laugh in fitting time and place, silently or aloud, each after his nature. Let us enjoy an innocent reaction rather than a guilty one, since reaction there must be. The bow that is always bent loses its elasticity, and becomes useless.

MARGARET FULLER OSSOLI*

THE authoress of *Woman in the Nineteenth Century*, known also in this country by her *Papers on Literature and Art*, occupied among her own people a station as notable as that of De Staël among the French, or of Rahel von Ense in Germany. Mystic and transcendental as she was, her writings teem with proof of original power, and are the expression of a thoughtful and energetic, if also a wayward and undisciplined, mind. One of the two compilers of these Memoirs (Emerson and W. H. Channing) observes, that his first impression of her was that of a 'Yankee Corinna'; and such is not unlikely to be the last impression of ordinary readers, ourselves among the number. In a letter, dated 1841, we find her saying: 'I feel all Italy glowing beneath the Saxon crust'—an apt illustration of her mental structure and tone of sentiment, compounded of New Worldedness, as represented by Margaret Fuller, and of the feelings of Southern Europe, as embodied in the Marchesa Ossoli. Without at this time pausing to review her literary position, and her influence upon contemporary minds, we proceed to draw from these interesting, but frequently eccentric and extravagantly worded Memoirs, a sketch of her remarkable life-history.

Margaret Fuller was born at Cambridge-Port, Massachusetts, in May 1810. Her father was a shrewd, practical, hard-headed lawyer, whose love for his wife 'was the green spot on which he stood apart from the commonplaces of a mere bread-winning, bread-bestowing existence.' That wife is described as a fair and flower-like nature, bound by one law with the blue sky, the dew, and the frolic birds. 'Of all persons whom I have known, she had in her most of the angelic—of that spontaneous love for every living thing, for man, and beast, and tree, which

* Memoirs of Margaret Fuller Ossoli. 3 vols. London: Bentley. 1852.

restores the Golden Age.* Mr Fuller, in undertaking the education of his daughter, committed the common error of excessive stimulation—thinking to gain time by forwarding the intellect as early as possible. He was himself a scholar, and hoped to make her the heir of all he knew, and of as much more as might be elsewhere attained. He was a severe and exacting disciplinarian, and permanently marred the nervous system of his child by the system he adopted of requiring her to recite her tasks on his return home at night, which was frequently very late. Hence a premature development of the brain, which, while it made her a youthful prodigy by day—one such youthful prodigy, it has been justly said, is often the pest of a whole neighbourhood—rendered her the nightly victim of spectral illusions, somnambulism, &c.; checked her growth; and eventually brought on continual headaches, weakness, and various nervous affections. As soon as the light was removed from her chamber at night, this ill-tended girl was haunted by colossal faces, that advanced slowly towards her, the eyes dilating, and each feature swelling loathsomely as they came; till at last, when they were about to close upon her, she started up with a shriek, which drove them away, but only to return when she lay down again. 'No wonder the child arose and walked in her sleep, moaning all over the house, till once, when they heard her, and came and waked her, and she told what she had dreamed, her father sharply bade her "leave off thinking of such nonsense, or she would be crazy"—never knowing that he was himself the cause of all these horrors of the night.' Her home seems to have been deficient in the charms and associations appropriate to childhood. Finding no relief from without, her already overexcited mind was driven for refuge from itself to the world of books. She tells us she was taught Latin and English grammar at the same time; in Latin, which she began to read at six years old, her father, and subsequently a tutor, trained her to a high degree of precision, expecting her to understand the mechanism of the language thoroughly, and to translate it tersely and unhesitatingly, with the definite clearness of one perfectly *au fait* in the philosophy of the classics. Thus she became imbued with an abiding interest in the genius of old Rome—the power of will, the dignity of a fixed purpose—where man takes a 'noble bronze in camps and battle-fields,' his brow well furrowed by the 'wrinkles of council,' and his eye 'cutting its way like the sword;' and thence she loved to escape, at Ovid's behest, to the enchanted gardens of the Greek mythology, to the gods and nymphs born of the sunbeam, the wave, the shadows on the hill—delighted to realise in those Greek forms the faith of a refined and intense childhood. Reading was now to her a habit and a passion. Its only rival attraction was the 'dear little garden' behind the house, where the best hours of her lonely child-life were spent. Within the house, everything, she says, was socially utilitarian; her books told of a proud world, but in another temper were the teachings of the little garden, where her thoughts could lie callow in the nest, and only be fed and kept warm, not called to fly or sing before the time. A range of blue hills, at about twelve miles' distance, allured her to reverie, and bred within her thoughts not too deep for tears. The books which exercised most power over her at this period were Shakespeare, Cervantes, and Molière—all three students of the 'natural history of man,' and inspired by fact, not fancy; reconstructing the world from materials which they collected on every side, not spinning from the desires of their own special natures; and accordingly teaching her, their open-eyed disciple, to distrust all invention which is not based on a wide experience, but, as she

confesses, also doing her harm, since the child, fed with meat instead of milk, becomes too soon mature. For a few months, this bookish life was interrupted, or varied, by the presence of an English lady, whom Margaret invested with ideal perfections as her 'first friend,' and whom she worshipped as a star from the east—a morning-star; and at whose departure she fell into a profound depression. Her father sought to dispel this rooted melancholy, by sending her to school—a destiny from which her whole nature revolted, as something alien to its innermost being and cherished associations. To school, however, she went, and at first captivated, and then scandalised her fellow-pupils by her strange ways. Now, she surprised them by her physical faculty of rivaling the spinning dervishes of the East—now, by declaiming verses, and acting a whole *répertoire* of parts, both laughter-raising and tear-compelling—now, by waking in the night, and cheating her restlessness by inventions that alternately diverted and teased her companions. She was always devising means to infringe upon the school-room routine. This involved her at last in a trouble, from which she was only extricated by the judicious tenderness of her teacher—the circumstances attending which 'crisis' are detailed at length in her story of 'Mariana.'

Her personal appearance at this time, and for some following years, is described by one of her friends as being that of a blooming girl of a florid complexion and vigorous health, with a tendency to robustness, which she unwisely endeavoured to suppress or conceal at the price of much future suffering. With no pretensions to beauty then, or at any time, her face was one that attracted, but baffled physiognomical art. 'She escaped the reproach of positive plainness, by her blond and abundant hair, by her excellent teeth, by her sparkling, busy eyes, which, though usually half-closed from near-sightedness, shot piercing glances at those with whom she conversed, and, most of all, by the very peculiar and graceful carriage of her head and neck.' In conversation she was already distinguished, though addicted to 'quizzing'—the not unreasonable ground of unpopularity with her female friends. Emerson alludes to her dangerous reputation for satire, which, in addition to her great scholarship, made the women dislike one who despised them, and the men cavil at her as 'carrying too many guns.' A fragment from a letter in her sixteenth year will illustrate her pursuits at that period:—'I rise a little before five, walk an hour, and then practise on the piano till seven, when we breakfast. Next, I read French—Sismondi's *Literature of Southern Europe*—till eight; then, two or three lectures in Brown's *Philosophy*. About half-past nine, I go to Mr Perkins's school, and study Greek till twelve, when, the school being dismissed, I recite, go home, and practise again till dinner, at two. Sometimes, if the conversation is very agreeable, I lounge for half an hour over the dessert, though rarely so lavish of time. Then, when I can, I read two hours in Italian, but I am often interrupted. At six, I walk, or take a drive. Before going to bed, I play or sing, for half an hour or so, to make all sleepy, and, about eleven, retire to write a little while in my journal, exercises on what I have read, or a series of characteristics which I am filling up according to advice.' Greek, French, Italian, metaphysics, and private authorship—pretty well for a miss in her teens, and surely a promissory-note on the *bas bleu* joint-stock company!—a note which she discharged in full when it became due. Next year (1826), we find her studying M^{me} de Staël, Epictetus, Milton, Racine, and Spanish ballads, 'with great delight.' Anon she is engrossed with the elder Italian poets, from Berni down to Pulci and Politian; then with Locke and the ontologists; then with the *opera omnia* of Sir William Temple. She pursued at this time no systematic

* Mr Fuller's Autobiography, which comprises the first sixty pages of these Memoirs.

study, but 'read with the heart, and was learning more from social experience than from books.' The interval of her life, between sixteen and twenty-five, is characterised by one of her biographers as a period of 'ponderating sentimentality, of romance and dreams, of yearning and of passion.' While residing at Cambridge, she suffered from profound despondency—conscious of the want of a home for her heart. A sterner schooling awaited her at Groton, whither her father removed in 1833. Here he died suddenly of cholera in 1835. Now she was taught the miserable perplexities of a family that has lost its head, and was called to tread a path for which, as she says, she had no skill and no call, except that it must be trodden by some one, and she alone was ready. In 1836 she went to Boston, to teach Latin and French in an academy of local repute; and in the ensuing year she accepted a 'very favourable offer,' to become 'lady-superior' in an educational institution at Providence, where she seems to have exercised an influence analogous to that of Dr Arnold at Rugby—treating her pupils as ladies, and thus making them anxious to prove that they deserved to be so treated.

By this time, she had attracted around her many and devoted friends. Her conversational powers were of a high order, by common consent. Mr Hedge describes her speech as remarkably fluent and correct; but deriving its strength not from fluency, choice diction, wit, or sentiment, but from accuracy of statement, keen discrimination, and a certain weight of judgment; together with rhetorical finish, it had an air of spontaneity which made it seem the grace of the moment: so that he says, 'I do not remember that the vulgar charge of talking "like a book" was ever fastened upon her, although, by her precision, she might seem to have incurred it.' The excitement of the presence of living persons seems to have energised her whole being. 'I need to be called out,' are her words, 'and never think alone, without imagining some companion. It is my habit, and bespeaks a second-rate mind.' And again: 'After all, this writing,' she says in a letter, 'is mighty dead. Oh, for my dear old Greeks, who talked everything—not to shine as in the Parisian saloons, but to learn, to teach, to vent the heart, to clear the head!' Mr Alcott of Boston considered her the most brilliant talker of the day. Miss Martineau was fascinated by the same charm. It is thus characterised by the author of *Representative Men*: 'Talent, memory, wit, stern introspection, poetic play, religion, the finest personal feeling, the aspects of the future, each followed each in full activity, and left me, I remember, enriched and sometimes astonished by the gifts of my guest.' Her self-complacency staggered many at first—as when she spoke, in the quietest manner, of the girls she had formed, the young men who owed everything to her, the fine companions she had long ago exhausted. 'I now know,' she has been heard to say in the coolest style, 'all the people worth knowing in America, and I find no intellect comparable to my own.' Well may Mr Emerson talk of her letting slip phrases that betrayed the presence of 'a rather mountainous *me*.' Such phrases abound in her conversation and correspondence—mountainous enough to be a hill of offence to the uninitiated and untranscendental. At anyrate, there was no affectation in this; she thoroughly believed in her own superiority; her subscription to *that* creed was implicit and *ex animo*. Nor do we detect affectation in her most notable vagaries and crotchets. She loved the truth, and spoke it out—we were about to write, manfully; and why not? At heart, she was, to use the words of an intimate and discerning friend, a right brave and heroic woman—shrinking from no duty because of feeble nerves. Numerous illustrations of this occur in the volumes before us. Thus we find her going

from a bridal of passing joyfulness to attend a near relative during a formidable surgical operation—or drawing five hundred dollars to bestow, on a New-York 'ne'er-do-weel,' half-patriot, half-author, always in such depths of distress, and with such squadrons of enemies that no charity could relieve, no intervention save him.

In 1839, she removed from Groton, with her mother and family, to Jamaica Plain, a few miles from Boston; and thence, shortly, to Cambridge and New York. Boston, however, was her *point d'appui*, and in it she formed acquaintances of every class, the most utilitarian and the most idealistic. In 1839, she published a translation of Goethe's *Conversations with Eckermann*; in 1841, the *Letters of Bettina*; in 1843, the *Summer on the Lakes*—a narrative of her tour to Lake Superior and Michigan. During the same period she was editor of the *Dial*, since conducted by Emerson and Ripley, and in which appeared her papers on Goethe and Beethoven, the Rhine, the Romaic Ballads, John Sterling's Poems, &c.

Exhausted by continuous exertion in teaching and writing for the press, Miss Fuller, in 1844, sought refreshment and health in change of scene; and, desiring rather new employments than cessation from work, she accepted a liberal offer from Mr Horace Greeley of New York, to become a regular contributor to the *Tribune*; and for that purpose to take up her abode in his house, first spending some time in the Highlands of the Hudson. At New York, she took an active interest, after Mrs Fry's manner, in the various benevolent institutions, and especially the prisons on Blackwell's Island. For more than a year she wrote regularly for the *Tribune*, 'always freshly, vigorously, but not always clearly.' The notice attracted by her articles insured fresh hosts of acquaintances, and she became a distinguished character at Miss Lynch's réunions, and at literary soirées of a similar order. In 1846, she left her native land—for ever, as the melancholy event proved—to join Mr and Mrs Spring in a European tour. Her letters home contain much pleasant gossip about some of the Old-World notabilities. Thus she records her interviews with Wordsworth in his Rydal retreat, with Dr Chalmers, Dr Andrew Combe, Mr De Quincey, the Howitts, &c. She visited Paris in the winter, and became acquainted with Lamennais, Béranger, Mme Dudevant, and others. Thence, in the spring of 1847, she went to Italy, where she remained until she embarked in 1850 on board that doomed ship, the *Elizabeth*. As a resident in Rome, her safety was seriously imperiled during the French siege of 1849. She was appointed by the 'Roman Commission for the succour of the wounded,' to the superintendence of an hospital, and all along took the liveliest interest in the fortunes of Mazzini and the republic. She was then a wife and a mother, having been married privately to the Marquis Ossoli, a Roman, 'of a noble but impoverished house,' whom she described, in a letter to her mother, as 'not in any respect such a person as people in general would expect to find with her,' being a man 'absolutely ignorant of books, and with no enthusiasm of character,' but endowed with excellent practical sense, a nice sense of duty, native refinement, and much sweetness of temper. The peculiar circumstances attending the marriage in that country, and at that agitated crisis, involved Margaret in numerous afflictions, and taxed her powers of endurance to the very uttermost.

She had to suffer compulsory separation from husband and child—the one in hourly peril of a bloody death, the other neglected and pining away in the hands of strangers: penury, loneliness, prostrating sickness, and treachery on the part of those around her, were meanwhile her own lot in the land of strangers. How this season of trial affected her character, may be inferred from the remarks of her friend Mrs. Story, then

journing in Italy, who says, that in Boston she had regarded Margaret as a person on intellectual stilts, with a large share of arrogance, and little sweetness of temper; and adds: 'How unlike to this was she now!—so delicate, so simple, confiding, and affectionate; with a true womanly heart and soul, sensitive and generous, and, what was to me a still greater surprise, possessed of so broad a charity, that she could cover with its mantle the faults and defects of all about her.' Her devotion to her husband, and her passionate attachment to her little Angelo, were exhibited in the liveliest colour: the influence she exercised, too, by love and sympathy, over Italians of every class with whom she came in contact, appears of a kind more tender, chastened, and womanly than that which previously characterised her. When the republican cause at Rome left no hope of present restoration, Margaret found a tranquil refuge in Florence, devoting her mornings to literary labours, and her evenings to social intercourse with cultivated natives and a few foreign visitors, among whom the Brownings occupied a distinguished place. Greatly straitened in means at this time, the repose she and her husband enjoyed at Florence, in their small and scantily-furnished room, seems to have been peculiarly grateful to both. Soon, however, arrangements were made for their departure to the United States; for Margaret was heart-weary at the political reaction in Europe, and the pecuniary expediency of publishing to advantage her chronicles of the revolution, seconded by a yearning to see her family and friends once more, constrained to this step.

From motives of economy, they took passage in a merchantman from Leghorn, the *Elizabeth*, the expense being one-half what a return by way of France would have been. The remonstrances of her acquaintance, founded on the fatigues of a two months' voyage—the comparative insecurity of such a bark—the exposed position of the cabin (on deck)—and so on, were not unaided by Margaret's own presentiments. Ossoli, when a boy, had been told by a fortune-teller, to 'beware of the sea,' and this was the first ship he had ever set his foot in. In a letter where she describes herself 'suffering, as never before, all the horrors of indecision,' his wife expresses a fervent prayer that it 'may not be my lot to lose my boy at sea, either by unsolaced illness, or amid the howling waves; or if so, that Ossoli, Angelo, and I may go together, and that the anguish may be brief.' That 'or if so' is affecting—and was realised, except, indeed, that the anguish was not brief, for it lasted twelve terrible hours—a long communion face to face with Death! The bark sailed May 17, 1850. Captain Hasty, 'so fine a model of the New-England seaman,' inspired the passengers with cheerful confidence, and for a few days all went prosperously. But early in June, Captain Hasty died of confluent small-pox. The child Angelino caught it, but recovered, and won all hearts by his playful innocence, loving especially to be walked up and down in the arms of the steward, who had just such a boy at home waiting his arrival. On Thursday, July 15, the *Elizabeth* was off the Jersey coast: at evening-tide, a breeze sprang up, which by midnight had become a hurricane. About four o'clock next morning, she struck on Fire Island beach, and lay at the mercy of the maddened ocean. Mr Channing's description of the wreck is a most picturesque narrative, but too long for quotation. Very touching is the sketch of the Ossoli group, remaining on board after nearly all the passengers and crew had perished or escaped to land, which was distant only a few hundred yards—the infant crying passionately, hovering in the wet, till soothed and lulled to sleep by his mother, a calm expectant of death; and Ossoli, dissuading by counsel and prayer their affrighted friends from Italy; all exchanging kindly partings, and sending messages home, if any should survive to be their bearer. Though persons were busy gathering

into carts, on the shore, whatever spoil was stranded, no life-boat appeared; and the few remaining on the wreck were now fain to trust themselves to the rioting surf. Margaret would not go alone. With her husband and attendant (Celeste), she was just about to try the planks prepared by four seamen, and the steward had just taken little Nino in his arms, pledged to save him or die, 'when a sea struck the fore-castle, and the foremast fell, carrying with it the deck and all upon it. The steward and Angelino were washed upon the beach, both dead, though warm, some twenty minutes after. Celeste and Ossoli were caught for a moment by the rigging, but the next wave swallowed them up. Margaret sank at once. When last seen, she had been seated at the foot of the foremast, still clad in her white night-dress, with her hair fallen loose upon her shoulders.' No trace was found of her manuscript on Italy: her love-correspondence with Ossoli was the only relic—the last memorial of that howling hurricane, pitiless sea, wreck on a sand-bar, an idle life-boat, beach-pirates, and not one friend!

With the exception of certain sections of laboured, writhing wordiness, the feverish restlessness and hectic symptoms of which are but too familiar to persons read in the literature of second-rate transcendentalism, these volumes comprise a large amount of matter that will well repay perusal, and portray a character of no ordinary type—a 'large-brained woman and large-hearted man.'

THE COUNTER-STROKE.

Just after breakfast one fine spring morning in 1837, an advertisement in the *Times* for a curate caught and fixed my attention. The salary was sufficiently remunerative for a bachelor, and the parish, as I personally knew, one of the most pleasantly situated in all Somersetshire. Having said that, the reader will readily understand that it could not have been a hundred miles from Taunton. I instantly wrote, enclosing testimonials, with which the Rev. Mr Townley, the rector, was so entirely satisfied, that the return-post brought me a positive engagement, unclogged with the slightest objection to one or two subsidiary items I had stipulated for, and accompanied by an invitation to make the rectory my home till I could conveniently suit myself elsewhere. This was both kind and handsome; and the next day but one I took coach, with a light heart, for my new destination. It thus happened that I became acquainted, and in some degree mixed up, with the train of events it is my present purpose to relate.

The rector I found to be a stout, portly gentleman, whose years already reached to between sixty and seventy. So many winters, although they had plentifully besprinkled his hair with gray, shone out with ruddy brightness in his still handsome face, and keen, kindly, bright-hazel eyes; and his voice, hearty and ringing, had not as yet one quaver of age in it. I met him at breakfast on the morning after my arrival, and his reception of me was most friendly. We had spoken together but for a few minutes, when one of the French windows, that led from the breakfast-room into a shrubbery and flower-garden, gently opened and admitted a lady, just then, as I afterwards learned, in her nineteenth spring. I use this term almost unconsciously, for I cannot even now, in the glowing summer of her life, dissociate her image from that season of youth and joyousness. She was introduced to me, with old-fashioned simplicity, as 'My grand-daughter, Agnes Townley.' It is difficult to look at beauty through other men's eyes, and, in the present instance, I feel that I should fail miserably in the endeavour to stamp upon this blank, dead paper, any adequate idea of the fresh loveliness, the rose-bud beauty of that young girl. I will merely say, that her perfectly Grecian

head, wreathed with wavy *bandeaux* of bright hair, undulating with golden light, vividly brought to my mind Raphael's halo-tinted portraits of the Virgin—with this difference, that in place of the holy calm and resignation of the painting, there was in Agnes Townley a sparkling youth and life, that even amidst the heat and glare of a crowded ball-room or of a theatre, irresistibly suggested and recalled the freshness and perfume of the morning—of a cloudless, rosy morning of May. And, far higher charm than feature-beauty, however exquisite, a sweetness of disposition, a kind gentleness of mind and temper, was evidenced in every line of her face, in every accent of the low-pitched, silver voice, that breathed through lips made only to smile.

Let me own, that I was greatly struck by so remarkable a combination of rare endowments; and this, I think, the sharp-eyed rector must have perceived, or he might not perhaps have been so immediately communicative with respect to the near prospects of his idolised grandchild, as he was the moment the young lady, after presiding at the breakfast-table, had withdrawn.

'We shall have gay doings, Mr Tyrrel, at the rectory shortly,' he said. 'Next Monday three weeks will, with the blessing of God, be Agnes Townley's wedding-day.'

'Wedding-day!'

'Yes,' rejoined the rector, turning towards and examining some flowers which Miss Townley had brought in and placed on the table. 'Yes, it has been for some time settled that Agnes shall on that day be united in holy wedlock to Mr Arbuthnot.'

'Mr Arbuthnot of Elm Park?'

'A great match, is it not, in a worldly point of view?' replied Mr Townley, with a pleasant smile at the tone of my exclamation. 'And much better than that: Robert Arbuthnot is a young man of a high and noble nature, as well as devotedly attached to Agnes. He will, I doubt not, prove in every respect a husband deserving and worthy of her; and that from the lips of a dotting old grandpapa must be esteemed high praise. You will see him presently.'

I did see him often, and quite agreed in the rector's estimate of his future grandson-in-law. I have not frequently seen a finer-looking young man—his age was twenty-six; and certainly one of a more honourable and kindly spirit, of a more genial temper than he, has never come within my observation. He had drawn a great prize in the matrimonial lottery, and, I felt, deserved his high fortune.

They were married at the time agreed upon, and the day was kept not only at Elm Park, and in its neighbourhood, but throughout 'our' parish, as a general holiday. And, strangely enough—at least I have never met with another instance of the kind—it was held by our entire female community, high as well as low, that the match was a perfectly equal one, notwithstanding that wealth and high worldly position were entirely on the bridegroom's side. In fact, that nobody less in the social scale than the representative of an old territorial family ought, in the nature of things, to have aspired to the hand of Agnes Townley, appeared to have been a foregone conclusion with everybody. This will give the reader a truer and more vivid impression of the bride, than any words or colours I might use.

The days, weeks, months of wedded life flew over Mr and Mrs Arbuthnot without a cloud, save a few dark but transitory ones which I saw now and then flit over the husband's countenance as the time when he should become a father drew near, and came to be more and more spoken of. 'I should not survive her,' said Mr Arbuthnot, one day in reply to a chance observation of the rector's, 'nor indeed desire to do so.' The gray-headed man seized and warmly pressed the husband's hand, and tears of sympathy filled his eyes; yet did he,

nevertheless, as in duty bound, utter grave words on the sinfulness of despair under any circumstances, and the duty, in all trials, however heavy, of patient submission to the will of God. But the venerable gentleman spoke in a hoarse and broken voice, and it was easy to see he felt with Mr Arbuthnot that the reality of an event, the bare possibility of which shook them so terribly, were a cross too heavy for human strength to bear and live.

It was of course decided that the expected heir or heiress should be intrusted to a wet-nurse, and a Mrs Danby, the wife of a miller living not very far from the rectory, was engaged for that purpose. I had frequently seen the woman; and her name, as the rector and I were one evening gossiping over our tea, on some subject or other that I forget, came up.

'A likely person,' I remarked; 'healthy, very good-looking, and one might make oath, a true-hearted creature. But there is withal a timidity, a frightenedness in her manner at times which, if I may hazard a perhaps uncharitable conjecture, speaks ill for that smart husband of hers.'

'You have hit the mark precisely, my dear sir. Danby is a sorry fellow, and a domestic tyrant to boot. His wife, who is really a good, but meek-hearted person, lived with us once. How old do you suppose her to be?'

'Five-and-twenty perhaps.'

'Six years more than that. She has a son of the name of Harper by a former marriage, who is in his tenth year. Anne wasn't a widow long. Danby was caught by her good looks, and she by the bait of a well-provided home. Unless, however, her husband gives up his corn speculations, she will not, I think, have that much longer.'

'Corn speculations! Surely Danby has no means adequate to indulgence in such a game as that?'

'Not he. But about two years ago he bought, on credit, I believe, a considerable quantity of wheat, and prices happening to fly suddenly up just then, he made a large profit. This has quite turned his head, which, by the by, was never, as Cockneys say, quite rightly screwed on.' The announcement of a visitor interrupted anything further the rector might have had to say, and I soon afterwards went home.

A sad accident occurred about a month subsequent to the foregoing conversation. The rector was out riding upon a usually quiet horse, which all at once took it into its head to shy at a scarecrow it must have seen a score of times, and thereby threw its rider. Help was fortunately at hand, and the reverend gentleman was instantly conveyed home, when it was found that his left thigh was broken. Thanks, however, to his temperate habits, it was before long authoritatively pronounced that, although it would be a considerable time before he was released from confinement, it was not probable that the lusty winter of his life would be shortened by what had happened. Unfortunately, the accident threatened to have evil consequences in another quarter. Immediately after it occurred, one Matthews, a busy, thick-headed lout of a butcher, rode furiously off to Elm Park with the news. Mrs Arbuthnot, who daily looked to be confined, was walking with her husband upon the lawn in front of the house, when the great burly blockhead rode up, and blurted out that the rector had been thrown from his horse, and it was feared killed!

The shock of such an announcement was of course overwhelming. A few hours afterwards, Mrs Arbuthnot gave birth to a healthy male-child; but the young mother's life, assailed by fever, was for many days utterly despaired of—for weeks held to tremble so evenly in the balance, that the slightest adverse circumstance might in a moment turn the scale deathward. At length the black horizon that seemed to encompass us so hopelessly, lightened, and afforded the

lover-husband a glimpse and hope of his vanished and well-nigh despaired of Eden. The promise was fulfilled. I was in the library with Mr Arbuthnot awaiting the physician's morning report, very anxiously expected at the rectory, when Dr Lindley entered the apartment in evidently cheerful mood.

'You have been causelessly alarmed,' he said. 'There is no fear whatever of a relapse. Weakness only remains, and that we shall slowly, perhaps, but certainly, remove.'

A gleam of lightning seemed to flash over Mr Arbuthnot's expressive countenance. 'Blessed be God!' he exclaimed. 'And how,' he added, 'shall we manage respecting the child? She asks for it incessantly.'

Mr Arbuthnot's infant son, I should state, had been consigned immediately after its birth to the care of Mrs Danby, who had herself been confined, also with a boy, about a fortnight previously. Scarlatina being prevalent in the neighbourhood, Mrs Danby was hurried away with the two children to a place near Bath, almost before she was able to bear the journey. Mr Arbuthnot had not left his wife for an hour, and consequently had only seen his child for a few minutes just after it was born.

'With respect to the child,' replied Dr Lindley, 'I am of opinion that Mrs Arbuthnot may see it in a day or two. Say the third day from this, if all goes well. I think we may venture so far; but I will be present, for any untoward agitation might be perhaps instantly fatal.' This point provisionally settled, we all three went our several ways: I to cheer the still suffering rector with the good news.

The next day but one, Mr Arbuthnot was in exuberant spirits. 'Dr Lindley's report is even more favourable than we had anticipated,' he said; 'and I start to-morrow morning, to bring Mrs Danby and the child.'—The postman's subdued but unmistakable knock interrupted him. 'The nurse,' he added, 'is very attentive and punctual. She writes almost every day.' A servant entered with a salver heaped with letters. Mr Arbuthnot tossed them over eagerly, and seizing one, after glancing at the post-mark, tore it eagerly open, muttering as he did so: 'It is not the usual handwriting; but from her, no doubt!'—'Merciful God!' I impulsively exclaimed, as I suddenly lifted my eyes to his. 'What is the matter?' A mortal pallor had spread over Mr Arbuthnot's before animated features, and he was glaring at the letter in his hand as if a basilisk had suddenly confronted him. Another moment, and the muscles of his frame appeared to give way suddenly, and he dropped heavily into the easy-chair from which he had risen to take the letters. I was terribly alarmed, and first loosening his neckerchief, for he seemed choking, I said: 'Let me call some one; and I turned to reach the bell, when he instantly seized my arms, and held me with a grip of iron. 'No—no—no!' he hoarsely gasped; 'water—water!' There was fortunately some on a side-table. I handed it to him, and he drank eagerly. It appeared to revive him a little. He thrust the crumpled letter into his pocket, and said in a low, quick whisper: 'There is some one coming! Not a word, remember—not a word!' At the same time, he wheeled his chair half round, so that his back should be towards the servant we heard approaching.

'I am sent, sir,' said Mrs Arbuthnot's maid, 'to ask if the post has arrived.'

'Yes,' replied Mr Arbuthnot, with wonderful mastery of his voice. 'Tell your mistress I shall be with her almost immediately, and that her—her son is quite well.'

'Mr Tyrrel,' he continued, as soon as the servant was out of hearing, 'there is, I think, a liqueur-stand on the sideboard in the large dining-room. Would you have the kindness to bring it me, unobserved—mind that—unobserved by any one?'

I did as he requested; and the instant I placed the liqueur-frame before him, he seized the brandy *carafe*, and drank with fierce eagerness. 'For goodness' sake,' I exclaimed, 'consider what you are about, Mr Arbuthnot: you will make yourself ill.'

'No, no,' he answered, after finishing his draught. 'It seems scarcely stronger than water. But I—I am better now. It was a sudden spasm of the heart; that's all. The letter,' he added, after a long and painful pause, during which he eyed me, I thought, with a kind of suspicion—'the letter you saw me open just now, comes from a relative, an aunt, who is ill, very ill, and wishes to see me instantly. You understand?'

I did understand, or at least I feared that I did too well. I, however, bowed acquiescence; and he presently rose from his chair, and strode about the apartment in great agitation, until his wife's bedroom bell rang. He then stopped suddenly short, shook himself, and looked anxiously at the reflection of his flushed and varying countenance in the magnificent chimney-glass.

'I do not look, I think—or, at least shall not, in a darkened room—odder, more out of the way—that is, more agitated—than one might, that one *must* appear, after hearing of the dangerous illness of—of—an aunt?'

'You look better, sir, than you did awhile since.'

'Yes, yes; much better, much better. I am glad to hear you say so. That was my wife's bell. She is anxious, no doubt, to see me.'

He left the apartment; was gone perhaps ten minutes; and when he returned, was a thought less nervous than before. I rose to go. 'Give my respects,' he said, 'to the good rector; and as an especial favour,' he added, with strong emphasis, 'let me ask of you not to mention to a living soul that you saw me so unmannered as I was just now; that I swallowed brandy. It would appear so strange, so weak, so ridiculous.'

I promised not to do so, and almost immediately left the house, very painfully affected. His son was, I concluded, either dead or dying, and he was thus bewilderedly casting about for means of keeping the terrible, perhaps fatal tidings from his wife. I afterwards heard that he left Elm Park in a postchaise, about two hours after I came away, unattended by a single servant!

He was gone three clear days only, at the end of which he returned with Mrs Danby and—his son—in florid health, too, and one of the finest babies of its age—about nine weeks only—I had ever seen. Thus vanished the air-drawn Doubting Castle and Giant Despair which I had so hastily conjured up! The cause assigned by Mr Arbuthnot for the agitation I had witnessed, was doubtless the true one; and yet, and the thought haunted me for months, years afterwards, he opened only *one* letter that morning, and had sent a message to his wife that the child was well!

Mrs Danby remained at the Park till the little Robert was weaned, and was then dismissed very munificently rewarded. Year after year rolled away without bringing Mr and Mrs Arbuthnot any additional little ones, and no one, therefore, could feel surprised at the enthusiastic love of the delighted mother for her handsome, nobly-promising boy. But that which did astonish me, though no one else, for it seemed that I alone noticed it, was a strange defect of character which began to develop itself in Mr Arbuthnot. He was positively jealous of his wife's affection for their own child! Many and many a time have I remarked, when he thought himself unobserved, an expression of intense pain flash from his fine, expressive eyes, at any more than usually fervent manifestation of the young mother's gushing love for her first and only born! It was altogether a mystery to me, and I as much as possible forbore to dwell upon the subject.

Nine years passed away without bringing any material change to the parties involved in this narrative, except those which time brings ordinarily in his

train. Young Robert Arbuthnot was a healthy, tall, fine-looking lad of his age; and his great-grandpapa, the rector, though not suffering under any actual physical or mental infirmity, had reached a time of life when the announcement that the golden bowl is broken, or the silver cord is loosed, may indeed be quick and sudden, but scarcely unexpected. Things had gone well, too, with the nurse, Mrs Danby, and her husband; well, at least, after a fashion. The speculative miller must have made good use of the gift to his wife for her care of little Arbuthnot, for he had built a genteel house near the mill, always rode a valuable horse, kept, it was said, a capital table; and all this, as it seemed, by his clever speculations in corn and flour, for the ordinary business of the mill was almost entirely neglected. He had no children of his own, but he had apparently taken, with much cordiality, to his step-son, a fine lad, now about eighteen years of age. This greatly grieved the boy's mother, who dreaded above all things that her son should contract the evil, dissolute habits of his father-in-law. Latterly, she had become extremely solicitous to procure the lad a permanent situation abroad, and this Mr Arbuthnot had promised should be effected at the earliest opportunity.

Thus stood affairs on the 16th of October 1846. Mr Arbuthnot was temporarily absent in Ireland, where he possessed large property, and was making personal inquiries as to the extent of the potato-rot, not long before announced. The morning's post had brought a letter to his wife, with the intelligence that he should reach home that very evening; and as the rectory was on the direct road to Elm Park, and her husband would be sure to pull up there, Mrs Arbuthnot came with her son to pass the afternoon there, and in some slight degree anticipate her husband's arrival.

About three o'clock, a chief-clerk of one of the Taunton banks rode up in a gig to the rectory, and asked to see the Rev. Mr Townley, on pressing and important business. He was ushered into the library, where the rector and I were at the moment rather busily engaged. The clerk said he had been to Elm Park, but not finding either Mr Arbuthnot or his lady there, he had thought that perhaps the Rev. Mr Townley might be able to pronounce upon the genuineness of a cheque for £300, purporting to be drawn on the Taunton Bank by Mr Arbuthnot, and which Danby the miller had obtained cash for at Bath. He further added, that the bank had refused payment, and detained the cheque, believing it to be a forgery.

'A forgery!' exclaimed the rector, after merely glancing at the document. 'No question that it is, and a very clumsily executed one, too. Besides, Mr Arbuthnot is not yet returned from Ireland.'

This was sufficient; and the messenger, with many apologies for his intrusion, withdrew, and hastened back to Taunton. We were still talking over this sad affair, although some hours had elapsed since the clerk's departure—in fact, candles had been brought in, and we were every moment expecting Mr Arbuthnot—when the sound of a horse at a hasty gallop was heard approaching, and presently the pale and haggard face of Danby shot by the window at which the rector and myself were standing. The gate-bell was rung almost immediately afterwards, and but a brief interval passed before 'Mr Danby' was announced to be in waiting. The servant had hardly gained the passage with leave to show him in, when the impatient visitor rushed rudely into the room in a state of great, and it seemed angry excitement.

'What, sir, is the meaning of this ill-mannered intrusion?' demanded the rector sternly.

'You have pronounced the cheque I paid away at Bath to be a forgery; and the officers are, I am told, already at my heels. Mr Arbuthnot, unfortunately, is not at home, and I am come, therefore, to seek shelter with you.'

'Shelter with me, sir!' exclaimed the indignant rector, moving, as he spoke, towards the bell. 'Out of my house you shall go this instant.'

The fellow placed his hand upon the reverend gentleman's arm, and looked with his bloodshot eyes keenly in his face.

'Don't!' said Danby; 'don't, for the sake of yourself and yours! Don't! I warn you: or, if you like the phrase better, don't, for the sake of me and mine.'

'Yours, fellow! Your wife, whom you have so long held in cruel bondage through her fears for her son, has at last shaken off that chain. James Harper sailed two days ago from Portsmouth for Bombay. I sent her the news two hours since.'

'Ha! Is that indeed so?' cried Danby, with an irrepressible start of alarm. 'Why, then— But no matter: here, luckily, comes Mrs Arbuthnot and her son. All's right! She will, I know, stand bail for me, and, if need be, acknowledge the genuineness of her husband's cheque.'

The fellow's insolence was becoming unbearable, and I was about to seize and thrust him forcibly from the apartment, when the sound of wheels was heard outside. 'Hold! one moment,' he cried with fierce vehemence. 'That is probably the officers: I must be brief, then, and to the purpose. Pray, madam, do not leave the room for your own sake: as for you, young sir, I command you to remain!'

'What! what does he mean?' exclaimed Mrs Arbuthnot bewilderedly, and at the same time clasping her son—who gazed on Danby with kindled eyes, and angry boyish defiance—tightly to her side. Did the man's strange words give form and significance to some dark, shadowy, indistinct doubt that had previously haunted her at times? I judged so. The rector appeared similarly confused and shaken, and had sunk nerveless and terrified upon a sofa.

'You guess dimly, I see, at what I have to say,' resumed Danby with a malignant sneer. 'Well, hear it, then, once for all, and then, if you will, give me up to the officers. Some years ago,' he continued, coldly and steadily—'some years ago, a woman, a nurse, was placed in charge of two infant children, both boys: one of these was her own; the other was the son of rich, proud parents. The woman's husband was a gay, jolly fellow, who much preferred spending money to earning it, and just then it happened that he was more than usually hard up. One afternoon, on visiting his wife, who had removed to a distance, he found that the rich man's child had sickened of the small-pox, and that there was no chance of its recovery. A letter containing the sad news was on a table, which he, the husband, took the liberty to open and read. After some reflection, suggested by what he had heard of the lady-mother's state of mind, he recopied the letter, for the sake of embodying in it a certain suggestion. That letter was duly posted, and the next day brought the rich man almost in a state of distraction; but his chief and mastering terror was lest the mother of the already dead infant should hear, in her then precarious state, of what had happened. The tidings, he was sure, would kill her. Seeing this, the cunning husband of the nurse suggested that, for the present, his—the cunning one's—child might be taken to the lady as her own, and that the truth could be revealed when she was strong enough to bear it. The rich man fell into the artful trap, and that which the husband of the nurse had speculated upon, came to pass even beyond his hopes. The lady grew to idolise her fancied child—she has, fortunately, had no other—and now, I think, it would really kill her to part with him. The rich man could not find it in his heart to un deceive his wife—every year it became more difficult, more impossible to do so; and very generously, I must say, has he paid in purse for the forbearance of the nurse's husband. Well now, then, to sum up: the nurse was Mrs Danby;

the rich, weak husband, Mr Arbuthnot; the substituted child, that handsome boy—*my son!*’

A wild scream from Mrs Arbuthnot broke the dread silence which had accompanied this frightful revelation, echoed by an agonised cry, half tenderness, half rage, from her husband, who had entered the room unobserved, and now clasped her passionately in his arms. The carriage-wheels we had heard were his. It was long before I could recall with calmness the tumult, terror, and confusion of that scene. Mr Arbuthnot strove to bear his wife from the apartment, but she would not be forced away, and kept imploring with frenzied vehemence that Robert—that her boy should not be taken from her.

‘I have no wish to do so—far from it,’ said Danby with gleeful exultation. ‘Only folk must be reasonable, and not threaten their friends with the hulks!’

‘Give him anything, anything!’ broke in the unhappy lady. ‘O Robert! Robert!’ she added with a renewed burst of hysterical grief, ‘how could you deceive me so?’

‘I have been punished, Agnes,’ he answered in a husky, broken voice, ‘for my well-intending but criminal weakness; cruelly punished by the ever-present consciousness that this discovery must one day or other be surely made. What do you want?’ he after awhile added with recovering firmness, addressing Danby.

‘The acknowledgment of the little bit of paper in dispute, of course; and say a genuine one to the same amount.’

‘Yes, yes,’ exclaimed Mrs Arbuthnot, still wildly sobbing, and holding the terrified boy strained in her embrace, as if she feared he might be wrenched from her by force. ‘Anything—pay him anything!’

At this moment, chancing to look towards the door of the apartment, I saw that it was partially opened, and that Danby’s wife was listening there. What might that mean? But what of helpful meaning in such a case could it have?

‘Be it so, love,’ said Mr Arbuthnot soothingly. ‘Danby, call to-morrow at the Park. And now, begone at once.’

‘I was thinking,’ resumed the rascal with swelling audacity, ‘that we might as well at the same time come to some permanent arrangement upon black and white. But never mind: I can always put the screw on; unless, indeed, you get tired of the young gentleman, and in that case, I doubt not, he will prove a dutiful and affectionate son—Ah, devil! What do you here? Begone, or I’ll murder you! Begone, do you hear?’

His wife had entered, and silently confronted him. ‘Your threats, evil man,’ replied the woman quietly, ‘have no terrors for me now. My son is beyond your reach. Oh, Mrs Arbuthnot,’ she added, turning towards and addressing that lady, ‘believe not!’

Her husband sprang at her with the bound of a panther. ‘Silence! Go home, or I’ll strangle!’—His own utterance was arrested by the fierce grasp of Mr Arbuthnot, who seized him by the throat, and hurled him to the further end of the room. ‘Speak on, woman; and quick! quick! What have you to say?’

‘That your son, dearest lady,’ she answered, throwing herself at Mrs Arbuthnot’s feet, ‘is as truly your own child as ever son born of woman!’

That shout of half-fearful triumph seems even now as I write to ring in my ears! I felt that the woman’s words were words of truth, but I could not see distinctly: the room whirled round, and the lights danced before my eyes, but I could hear through all the choking ecstasy of the mother, and the fury of the baffled felon.

‘The letter,’ continued Mrs Danby, ‘which my husband found and opened, would have informed you,

sir, of the swiftly approaching death of *my* child, and that yours had been carefully kept beyond the reach of contagion. The letter you received was written without my knowledge or consent. True it is that, terrified by my husband’s threats, and in some measure reconciled to the wicked imposition by knowing that, after all, the right child would be in his right place, I afterwards lent myself to Danby’s evil purposes. But I chiefly feared for my son, whom I fully believed he would not have scrupled to make away with in revenge for my exposing his profitable fraud. I have sinned; I can hardly hope to be forgiven, but I have now told the sacred truth.’

All this was uttered by the repentant woman, but at the time it was almost wholly unheard by those most interested in the statement. They only comprehended that they were saved—that the child was theirs in very truth. Great, abundant, but for the moment, bewildering joy! Mr Arbuthnot—his beautiful young wife—her own true boy (how could she for a moment have doubted that he was her own true boy!—you might read that thought through all her tears, thickly as they fell)—the aged and half-stunned rector, whilst yet Mrs Danby was speaking, were exclaiming, sobbing in each other’s arms, ay, and praising God too, with broken voices and incoherent words it may be, but certainly with fervent, pious, grateful hearts.

When we had time to look about us, it was found that the felon had disappeared—escaped. It was well, perhaps, that he had; better, that he has not been heard of since.

THE TAXES ON KNOWLEDGE.

To all appearance, the abolition of the taxes on the spread of knowledge through the press is only a matter of time. The principal of these taxes is the Excise-duty on paper, which, as we have repeatedly urged, acts most detrimentally on the issue of a cheap class of publications. The duty next in importance is that which is charged on advertisements. Our belief is, that a relief from this taxation would be a prodigious advantage to all departments of trade and commerce, as well as to various social interests. That the sum of eightpence should be exacted by the state from every person—a poor housemaid, for example—on advertising for a situation, is, to say the least of it, inexpressibly shabby. The stamp-duty of one penny on each newspaper is reckoned to be the third of these taxes on knowledge. There can be no doubt that this duty is a tax, as applied to those newspapers which circulate in a locality without going through the post-office; but, as matters stand, we are inclined to think that much the larger proportion of newspapers, metropolitan and provincial, actually are posted, either by the publishers, or by parties sending their copies to be read at second-hand. It is not quite clear that the remission of the stamp-duty would be an entire gain; for a postage of a penny in sending to second, third, and fourth readers—each fresh hand requiring to adhibit a fresh postage label—might come to a very much more severe tax than the existing stamp. Much, however, can be said on both sides; and we desire to let each party state its own case.

The *British Quarterly Review*, in an able article on the Newspaper Stamp and its proposed abolition, argues for that measure on one particular ground—namely, its certain result in allowing of the existence of small local papers. The writer says: ‘Take the *Leeds Mercury*, the *Manchester Guardian*, or the *Manchester Examiner*, for example—all first-class papers, of the

largest size allowed by law, and all giving four-page supplements once a week. In spite of their immense size, there is not one of these journals which can give a faithful weekly record of all that is worthy of note in the forty or fifty towns and villages by which they are surrounded, and through which these papers circulate. An attempt, indeed, is made to give as many "Town-Council Meetings," "Board of Guardian Proceedings," "Temperance Demonstrations," and "Meetings of Rate-payers"—with a due mixture of change-rings, friendly anniversaries, elections of church-wardens, elections of town-councillors, elections of guardians, offences, accidents, and crimes—as can be crammed, by rapid abridgment, into a certain number of columns. But after all has been done in this way that the most skilful and industrious editor, aided by the most indefatigable sub-editor, can accomplish, or that any reasonable newspaper reader in any of the smaller towns could possibly require, there still remains a great number of equally important events, which are necessarily left unnoticed altogether by the mammoth journal, for sheer want of space, or given in a form so much abridged as to render them of little or no value. The people of Oldham are perhaps waiting with intense anxiety for a long and amusing account of the "Extraordinary Scene" at the last meeting of the board of poor-law guardians; or those of Ashton are looking forward with equal interest to Saturday's paper, for a report of the animated debate in the town-council on the proposed increase of two policemen for that borough; or perhaps the news-agents of Rochdale, in anticipation of a brisk demand, have ordered twice the usual number of papers because of a church-rate contest, in which the vicar has been beaten by an overwhelming majority. But the columns of the *Manchester Guardian*, though nearly double what they were twenty years ago, are not made of India rubber; and therefore, much as the editor may wish to give all due latitude to Ashton, Bolton, Bury, Middleton, Oldham, Rochdale, Stockport, or Wigan news, he is generally forced, by the pressure of advertisements, or some other equally potent cause, to compress everything within the narrowest limits. Whatever interest a piece of district news may possess in its own locality, it must not be allowed to encroach upon the space belonging to "the general reader," who buys nine-tenths of every newspaper, and who does not care a farthing for Rochdale or Ashton news, unless when it happens to be a very horrid murder, or an exceedingly destructive fire. Were the stamp-duty abolished, the large town papers would be relieved from all the drudgery and annoyance attendant upon this department of editorial work. There would no longer be any necessity for devoting six or eight closely-printed columns of the paper to local news, which are not read by one-twentieth part of those who purchase it. Each small town in Lancashire and Yorkshire, as well as elsewhere, would have its penny or twopenny newspaper, in which local news, local politics, and local talent, would have fair play; while large papers, like the *Manchester Guardian* or the *Leeds Mercury*, would be greatly improved by the change. They would be enabled to substitute good readable matter, literary or political, of which there is always abundance, for the very dull stuff which they are now obliged to give under the head of "District News." By this improvement in character, and by the reduction of price, in such papers as we have named, from 5d. to 3½d., their

circulation would be greatly increased, in spite of the number of penny and twopenny papers which would then supply the demand for news among that numerous portion of the working-classes who cannot afford such a luxury at present.

Such is a fair statement of certain advantages to be derived from the abolition of the penny stamp, and the substitution of the penny label. The advocates of the stamp-duty allege that, while the foregoing line of argument may be perfectly valid, something, on the contrary, is due to the advantage of having well-supported metropolitan newspapers as centres of intelligence. These newspapers, say some of their publishers, are put to vast expense for early news, foreign and domestic; such news they at present permit every one freely to copy; but, if a host of small country papers are to spring up, piracy of this kind will no longer be tolerated. As newspapers go pretty much on the principle of giving and taking in the way of intelligence, any tendency to prosecute on the ground of piracy would, in all probability, soon cure itself; and, therefore, we would not greatly rely on this as a reason for maintaining an exclusiveness in the business of newspaper publication. A more serious argument against the creation of a host of cheap local papers, is the probable dissemination of much petty scandal, and matter of a partially libellous or offensive character; at the least, much bad writing. Supposing, however, that there is a chance of literature being thus to a certain extent deteriorated, it will not do to oppose an improvement, if it be such, from fears of this nature. Should the matter treated of in small local papers be sometimes of an objectionable character, the public taste will surely go far towards its correction; and why should not each provincial town have an opportunity of educating writers up to the proper degree of literary accomplishment? It is undeniable, that small towns stand in pressing need of local channels for advertisements, and here, we think, is their strongest ground. How much more important, in a town of 5000 inhabitants, that the principal mercer should have his fresh arrival of goods advertised in a paper which circulates 500 copies in that town, than in some county-town journal which sends to it only some thirty or forty copies! A sale of growing crops must, in like manner, be much more effectually advertised in a paper which circulates largely in a small district, than in one which is diffused sparsely over a large one. All this, indeed, is amply proved by the tendency which has been shewn of late years, in Scotland at least, to set up unstamped monthly local papers containing advertisements, and by the comparative success which these journals have met with.

Among the arguments for such arrangements as would promote the sale of newspapers, we see little or no stress laid upon the *educational*, which to us appears as the very strongest of all. The interest felt in the occurrences of the passing day is one of the most vigorous of all intellectual appetences. Give a man ready access to a journal in which this taste can be gratified, and his intellectual progress is certain. The utterly uneducated, seeing the pleasure which his fellows derive from the paper, will desire to learn to read, that he may enjoy the like pleasure. The man just able to read will be drawn on to reflect and judge, and in time he will desire intellectual food from books also. The cheap newspaper thus becomes a most powerful instrument for nursing the popular mind; and, if we consider how essential it is, where there are free institutions, that the bulk of the people should be enlightened, we must see what a great public end is to be served by this simple means. A place in the apparatus is, we

think, rightly claimed by the small local newspaper, as a kind of A B C, or *first form*, where the young and untutored mind may be entered by way of preparation for higher studies.

THE VEGETATION OF EUROPE.

THE publication of the volume, the title of which appears below,* is to be regarded as additional evidence that the tendency of science in the present day is towards wider and more comprehensive generalisations. Many readers who may be more or less familiar with certain species or even families of plants, will hardly have prepared themselves for a view of the phytology of a quarter of the globe, such as is given in outline in the interesting work now before us. The subject is one that has been largely investigated within the past twenty years, as may be seen in the records of the British Association, in the transactions of learned societies, and in the writings of numerous observers on the continent. Attempt after attempt has been made to explain the causes of the variations and effects of climate, their influence on vegetation, the appearance of certain floras in localities where they might be least expected, and to separate the natural and regular from the accidental. Different countries have been examined and compared with each other, and many of the differences accounted for; and in Mr Henfrey's volume we have an acceptable *résumé* of these various researches.

It becomes necessary, first of all, to study the influences—whether general or special—which affect the distribution of vegetation; to inquire into those freaks or aberrations of nature which favour in one place the production of plants that will not grow in another, under apparently similar circumstances; and why similar plants are found in places widely separated. Oranges will ripen on one side the Alps, but not on the other; grapes scarcely come to perfection out of doors in England, while on the other side of the Channel they ripen by thousands of acres; and several fruits which fail in our northern counties, are grown without difficulty in Denmark in the open air. Investigation soon shewed that temperature alone, mere heat and cold, was insufficient to account for the phenomena; but that moisture and dryness, the prevalence of certain winds, the chemical and physical conditions of soil, and the constitution of the plants themselves, would have to be considered in a proper inquiry into the subject.

Here we must notice a fact which has proved of essential service in the study of botanical geography—namely, the discovery 'that there is some law presiding over the distribution of plants which causes the appearance of particular species arbitrarily—if we may so say it—in particular places;' from which, the conclusion has been arrived at, 'that countries have become populated with plants partly by the spreading of some special kinds from centres within those countries where they were originally exclusively created; and while these have spread outward into the neighbouring regions, colonists from like centres lying in the surrounding countries have invaded and become intermingled with the indigenous inhabitants.'

Looking at the effect of climate on vegetation, we find that as we proceed from the north towards the south, the number and luxuriance of plants increase

in a remarkable degree, and the same result is observable in altitude as in latitude. 'Step by step,' writes Mr Henfrey, 'as the land rises in any mountain region, the vegetation assumes, more and more, a polar character; and in the mountains of the tropics, a succession of stages has been distinguished, corresponding in the general peculiarities of the plants which clothe them, to tracts extending horizontally, in succession, on the sea-level, from the base of these mountains to the frozen regions within the arctic and antarctic circles. Increase of elevation is accompanied by an alteration of climate, bringing with it a set of conditions analogous to those prevailing at certain distances further from the sun. Ascending the Peak of Teneriffe, a series of regions are traversed, one above another, displaying with the approach to the summit a continually closer approximation in character to the polar regions, till the traveller who left the palm, the cactus, and the thousand varied forms of tropical vegetation at the foot, finds himself at last among the stunted shrubs and scaly lichens, the borderers who hold the outposts on the limits of the eternal snow.'

It might be expected that places on the same parallel of latitude would be equal in temperature; but on tracing out the distribution of heat over the globe, and laying it down in what are called *isothermal* lines on a map, most striking deviations are found to exist, and the contour of the lines is anything but regular. The line of greatest cold, for example, which leaves the eastern coast of Labrador at about the 54th degree of latitude, rises six degrees as it approaches Greenland, and strikes the coast of Lapland a little above the 70th degree, or sixteen degrees nearer the pole than at its starting-point—thus shewing that the northern parts of Europe have a more genial climate than those of America. The line then curves fifteen degrees to the south across Siberia, rises again on the western coast of America, and falls once more as it advances towards the east. Again, 'the isotherms of Canada pass through Iceland, across about the middle of Norway and Sweden, St Petersburg and Kamtschatka. Those of New York through the north of Ireland and England, twelve degrees further north, North and Central Germany, and the Crimea. That which leaves the United States at about 36 degrees north latitude, crosses Southern Europe from the north of Spain to the Adriatic in a tolerably straight line, some eight degrees further north, and then falls south again, where the influence of the north-east polar current is more felt, in Greece and Turkey.'

But although these are marked as lines of equal heat, it is only in the average temperature that the equality consists; and it is clear that a country with 80 degrees of summer heat and 20 of winter cold, would have a very different climate from another with 60 and 40 as the highest and lowest degrees of temperature, although the mean of the two would be the same. And herein we have an explanation of what at first sight appear to be anomalies: we know, for instance, 'that plants will flourish perennially in the British isles which are killed by the frosts of winter in places lying considerably to the south upon the continent; thus the laurel, that bears our winters steadily in Ireland and the west of England, and is only affected by very severe frosts in our eastern counties, is killed by the winters of Berlin, equally fatal to the myrtle, the fuchsia, and a host of other shrubs which attain

* The Vegetation of Europe, its Conditions and Causes. By Arthur Henfrey, F.L.S. London: John Van Voorst. 1839.

considerable age and size in the western portions of the British isles. Again, Canada, which lies south of Paris, has the climate of Drontheim, in Norway; while at New York, lying in the latitude of Naples, the flowers open simultaneously with those of Upsala, in Sweden. Moreover, those very countries suffering so severe a winter's cold, enjoy a summer's heat far exceeding ours, since the snow lies for months on parts of Germany which yet receive sufficient heat in summer to ripen the grape and Indian corn.

The principal modifying causes are winds and water. Islands, and countries bordering on the ocean, have a much more equable climate than those which lie in the interior of continents, and will have a greater prevalence of moist south-westerly winds. The average annual quantity of rain in the British islands is from 28 to 30 inches; on the continent, it is less; the fall in Holland is estimated at 26 inches, and in Denmark and North Germany, at 20 inches—the greatest fall occurring in summer and autumn, as in England. Then with respect to winds, we find those from the west most prevalent over what Mr Henfrey distinguishes as the north European plain, as is the case in our country. 'The west wind blows more frequently in England than in Denmark, more there than in Russia. The predominance is most marked in summer; in the winter, the easterly winds are almost as frequent as the westerly upon the continent, which is not true of the British isles.' Sometimes, however, the south-westerly winds, which bring our genial April showers, continue to arrive with their watery burden until late in the summer, to the detriment or destruction of grain-crops; and yet this same wind, losing its excessive moisture as it sweeps onward over the continent, is highly favourable to the husbandman in Southern Russia. The years 1816 and 1817 were cases in point.

The meteorology of Russia affords some striking contrasts: the yearly rain-fall in St Petersburg is 21 inches, 'and the westerly winds are most prevalent, although not to the same extent as in Western Europe; they are also predominant in Moscow and Kasan. In the southern steppes, it is stated that the average of four years has given only 6 inches fall of rain, occurring in 47 days of the year; but the irregularity is so great, that single years gave 59, 35, 39, and 53 rainy days. In 1832-3, twenty months elapsed without rain, and in some years the quantity is only one-tenth of that which falls in wet years. In the summer, there is no dew, and the ground dries up and cracks, the plants withering up: 1841, not considered as a dry year, gave only 8½ inches of rain; but in 1831, one of the wettest, the moisture interfered with agriculture more than the drought does, saturating the soil, which rests on a deep impermeable clayey formation.' In April and May, when the snows melt, the steppe is a vast sea of mud, liable to be hardened by occasional frosts, until, as the season advances, myriads of crocuses, tulips, and hyacinths, cover the soil, which perhaps a few days later will be hidden by north-east snow-storms, or drenched by gales from the north-west. No rain falls for two months after the middle of June, the luxuriant herbage withers more rapidly than it grew, and, except in a few spots near the streams, the steppe becomes a black, arid waste. Yet in some parts of these regions the vegetation is extraordinary: 'the wormwoods and thistles grow to a size unknown in the west of Europe; it is said that the thistle-bush, found where these abound, is tall enough to hide a Cossack horseman. The natives call all these rank weeds, useless for pasture, *burian*, and, with the dry dung of the flocks, this constitutes all the fuel they possess. One curious plant of the thistle tribe has attracted the notice of most travellers—the wind-witch, as it is called by the German colonists, or leap-the-field, as the Russian name may be translated. It forms a large globular mass of light wiry

branches interlaced together, and in autumn decays off at the root, the upper part drying up. It is then at the mercy of the autumn blast, and it is said that thousands may sometimes be seen coursing over the plain, rolling, dancing, and leaping over the slight inequalities, often looking at a distance like a troop of wild horses. It is not uncommon for twenty or thirty to become entangled into a mass, and then roll away, as Mr Kohl says, "like a huge giant in his seven-league boots." Thousands of them are annually blown into the Black Sea, and here, once in contact with water, in an instant lose the fantastic grace belonging to their dry, unsubstantial texture.'

Any one who has seen the feather-like seeds of thistles and dandelions floating about in the air, will have little difficulty in comprehending the effect of winds on the distribution of vegetation. Such seeds, as Mr Henfrey observes, might readily be carried across Europe by a powerful autumn gale, blowing steadily in one direction. In physiological language, they belong to the *sporadic*, not to the *endemic* class, of which a remarkable instance is afforded in the flea-bane (*Eriogon canadensis*), a plant which, having found its way to this side the Atlantic only since the discovery of America, is now a common weed on the continent of Europe. Running streams and ocean currents also transport seeds from one locality to another. The gulf-stream, as is well known, carries occasionally branches of trees to the north coast of Scotland and Norway; and 'Mr Brown found that six hundred plants collected about the river Zaire, in Africa, included thirteen species, natives also of Guyana and Brazil. These species mostly occurred near the mouth of the Zaire, and were of such kind as produced fruits capable of resisting external agencies for a long time.' Then, again, the agency of birds, of quadrupeds, and of man, in the distribution of seeds and plants, is too important to be overlooked, as Sir Charles Lyell has ably shewn in his *Principles of Geology*; and there is 'a certain number of plants which seem to accompany man wherever he goes, and to flourish best in his vicinity. Thus, the docks, the goosefoots, the nettle, the chickweed, mallows, and many other common weeds, seem to be universal, though unwelcome companions to man—dogging his footsteps, affording by their presence, even in now deserted districts, an almost certain index of the former residence of human beings on the spot.'

From an examination of the causes affecting distribution, Mr Henfrey passes to a survey of the characteristics of the countries of Europe, from north to south—from the peninsula of Scandinavia to those of Spain, Italy, and Greece. The remarkable contrast is pointed out between the climate and cultivation of the east and west sides of the mountains of Sweden and Norway. Barley ripens as far north as the 70th degree, in latitudes whose mean temperature is below the freezing-point; while in Switzerland, corn ceases to ripen at 9 degrees above the same point, and in the plateaux of South America, at 22½ degrees—a fact which goes to shew, 'that the growth of grain is much more dependent on the summer temperature than on the annual mean. The long summer days of the polar regions afford a very brief, but a comparatively exalted summer heat.' It is, however, only the barley which ventures so far north: the limit of rye is 67 degrees, of oats, 65 degrees, of wheat, 64 degrees, on the west side of the peninsula, and from 1 to 2 degrees less on the east. In Southern Norway, the spruce-fir ceases to grow beyond the line of 2900 feet above the sea-level; while in Switzerland, it is commonly met with at the height of 5500 feet, and in some situations, 7000; shewing that the influences which affect the growth of grain do not similarly affect that of trees—proximity of the sea decreases the summer temperature. Again: 'In Scandinavia the tree-limit is indicated by the birch; in the Alps, by firs. The two lower mountain zones of

the Alps, the regions of the beech and the chestnut, do not exist in the Scandinavian mountains. Compared with the climate and tree-limits, the cultivation of corn does not go so high in the Alps as it does toward the north; for it ceases about with the beech in the Alps, and grazing is the regular pursuit in the region of firs; while in Scandinavia, the beech only goes to 59 degrees, and corn-culture to 70 degrees—that is, as far as the conifers. Corn succeeds in the latter under a mean temperature below the freezing-point, while in the Alps it ceases at 41 degrees Fahrenheit. The cause of this is the hot though short summer of the north. The Alps have maize and the vine, which will not grow around the Scandinavian mountains; the meadows are throughout richer in the Alps, and grazing is therefore much more extensively pursued.

The peculiarities and comparisons afforded by other countries, are not less interesting than those we have selected, and we might multiply instances, if space permitted. Enough, however, have been adduced to shew that the mode of accounting for differences of vegetation is so far satisfactory, that it appears to be in perfect accordance with discoverable natural laws; and it is no longer a surprise or mystery to find plants of Southern Russia and of Asia Minor on the high table-lands of Spain; or that the effects of an unvarying temperature, as at Quito, in the table-land of Peru, are to cause the culture of wheat to cease at the mean temperature of Milan, and woods to disappear at the mean of Penzance. A few remarks respecting our own country is all that we can now find room for.

Including snow-falls, the number of rainy days in Dublin in a year is 208, in London, 178, while in Copenhagen it is not more than 134. The number of British plants indigenous or naturalised is from 1400 to 1500, comprising mostly the vegetation of Central Europe, but including specimens from Scandinavia and the Pyrenees. The highest point at which grain has been known to grow, is 1600 feet above the sea-level, at the outlet of Loch Collater, in the Highlands. In Drumochter Pass, an elevation of 1530 feet, potatoes can scarcely be raised; and from 1000 to 1200 feet is the more common limit of the cereal and the esculent. On this point a statement is made, which may be useful to cultivators in the hill districts: it is, that 'the common brake-fern (*Pteris aquilina*), distributed throughout Britain, is found to be limited by a line running nearly level with the limit of cultivation, and thus affords a test, when cultivation may be absent, where nature does not deny it success. In one sheltered spot in the woods of Loch-na-gar, it was observed at 1900 feet; and in another part of the same woods, at 1700 feet; but on the exposed moors it is very seldom seen beyond 1200 feet, unless in hollows, or on declivities facing the sun.'

In accounting for the varieties of plants in Britain, it is assumed that, during the glacial period, when the tops of our mountains were mere islands in a great sea, under which lay the greater part of modern Europe, they were then peopled by the arctic and alpine species, which now inhabit them. Then came an upheaval; a vast tract of land rose above the water, without any break, as at present between England and the continent; and at this period 'there appears to have been a migration of both plants and animals from east to west, the descendants of which still constitute the great body of the flora and fauna of the British lowlands.' Meantime, the elevation of the former islands into mountain summits, placed them in a temperature suited to the perpetuation of their vegetation. Then, to account for the presence of a Spanish flora in the west of Ireland, a bold hypothesis, started by Professor Edward Forbes, is put forward—that the west of Ireland was geologically united with the north of Spain; admitting which, there is no difficulty in supposing the plants to have travelled along the intervening land, which has

subsequently disappeared, and that, owing to climatic changes, the harder sort of plants, such as saxifrages and heaths, have alone survived.

A HALF-PENNYWORTH OF NAVIGATION.

Who's for a cheap ride on what a pleasant writer calls the 'silent highway?'—silent no longer, since the steamers have taken to plying above Bridge at a charge which has made the surface of the Thames, where it runs through the heart of London, populous with life, and noisy with the clash of paddles and the rush of steam, to say nothing of the incessant chorus of captains, engine-boys, and gangway-men—with their 'Ease her,' 'Stop her,' 'Back her,' 'Turn ahead,' 'Turn astarn,' 'Now, marm, with the bundle, be alive,' 'Heave ahead there, will you?' &c., all the day long.

Come this way, my friend; here we are opposite the Adelphi Theatre, and this is the man who used to be a black man, or else it's another, who does duty as talking finger-post, and shews you, if you are a stranger, how you are to get at the half-penny boat. Come, we must dive down this narrow lane, past the 'Fox under the Hill,' a rather long and not very slightly, cleanly, smooth, or fragrant thoroughfare; and here, in this shed-looking office, you must pay your half-penny, which guarantees you a passage all the way to London Bridge. Look alive! as the money-taker recommends—the *Bee*, you see, is already discharging her living cargo, and others are hurrying on board. The boat won't lose time in turning round—she goes backwards and forwards as straight as a saw, and carries a rudder at her nose as well as one at her tail. Never mind these jolting planks, you haven't time to tumble down—on with you! That's it: here, on this floating-pier, manufactured from old barges, we may rest a moment, while the boat discharges her freight, and takes on board the return cargo. You see the landing-stage or pier is divided into two equal portions; the people who are leaving the boat have not yet paid their fare; they will have to disburse their coppers at the office where we paid ours, there being but one paying-place for the two termini.

'Tis a motley company, you see, which comes and goes by the half-penny boat. Here is a Temple barrister, with his red-taped brief under his arm, and at his heels follows a plasterer, and a tiler's labourer with a six-foot chimney-pot upon his shoulders. There goes a foreigner—foreigners like to have things cheap—with a bushy black beard and a pale face, moustached and whiskered to the eyes, and puffing a volume of smoke from his invisible mouth; and there is a washer-woman, with a basket of clothes weighing a hundredweight. Yonder young fellow, with the dripping sack on his back, is staggering under a load of oysters from Billingsgate, and he has got to wash them and sell them for three a penny, and see them swallowed one at a time, before his work will be done for the day—and behind him is a comely lassie, with a monster oil-glazed sarcophagus-looking milliner's basket, carrying home a couple of bonnets to a customer. See! there is lame Jack, who sweeps the crossing in the borough, followed by a lady with her 'six years' darling of a pigmy size,' whom she calls 'Little Poppo,' both hurrying home to dinner after a morning's shopping. All these, and a hundred others of equally varied description, go off on the landing-stage, whence they will have to pay their obolus to the Charon of the Thames ere they are swallowed up in the living tide that rolls along the Strand from morn to night.

Now, if we mean to go, we had better get on board, for in another minute the deck will be covered, and we shall not find room to stand. That's right; make sure of a seat while you may! How they swarm on board, and what a choice sample they present of the mixed multitude of London! The deck is literally jammed with every variety of the pedestrian population—

red-breasted soldiers from the barracks, glazed-hatted policemen from the station, Irish labourers and their wives, errand-boys with notes and packages, orange-girls with empty baskets, working-men out for a mouthful of air, and idle boys out for a 'spree'—men with burdens to carry, and men with hardly a rag to cover them; unctuous Jews, jabbering Frenchmen, and drowsy-looking Germans—on they flock, squeezing through the gangway, or clambering over the bulwarks, while the little vessel rolls and lurches till the water laves the planks on which you stand. In three minutes from her arrival she has discharged her old cargo, and is crammed to overflowing with a new one. 'Back, there: overloaded already!' roars the captain. 'Let go; turn ahead; go on!'—and *fix!* away we go, leaving full half of the intending voyagers to wait for the next boat, which, however, will not be long in coming.

'Bless me, how we roll about from side to side!' says an anxious old lady. 'Is anything the matter with the boat, that it wabbles so?'

'Only a little krank, marm; it's all right,' says the person addressed.

'It's all right, of course,' says another, glancing at the nervous lady, 'whether we goes up or whether we goes down, so long as we gets along. The *Cricket* blowed herself up, and the *Ant* got tired on it, and laid down to rest herself at the bottom t'other day. Howasever, a steamer never blows up nor goes to the bottom but once, and, please God, 't aint goin' to be this time.'

While the old lady, unsatisfied with this genuine specimen of Cockney philosophy, is vowing that if she once gets safe on shore, she will never again set foot in a half-penny boat, we are already at Waterloo Bridge. Duck goes the funnel, and we dart under the noble arch, and catch a passing view of Somerset House. The handsome structure runs away in our rear; the Chinese Junk, with its tawdry flags, scuttles after it; we catch a momentary glimpse of Temple Gardens, lying in the sunlight, where half-a-dozen children are playing on the grass; then comes Whitefriars, the old Alsatia, the sanctuary of blackguard ruffianism in bygone times; then there is a smell of gas, and a vision of enormous gasometers; and then down goes the funnel again, and Blackfriars Bridge jumps over us. On we go, now at the top of our speed, past the dingy brick warehouses that lie under the shadow of St Paul's, whose black dome looks down upon us as we scud along. Then Southwark Bridge, with its Cyclopean masses of gloomy metal, disdains to return the slightest response to the fussy splashing we make, as we shoot impudently through. Then come more wharfs and warehouses, as we glide past, while our pace slackens, and we stop gently within a stone's-throw of London Bridge, at Dyers' Hall, where we are bundled out of the boat with as little ceremony as we were bundled in, and with as little, indeed, as it has ever been the custom to use since ceremony was invented—which, in matters of business, is a very useless thing.

And now, my friend, you have accomplished a half-penny voyage; and without being a conjuror, you can see how it is that this cheap navigation is so much encouraged. In the first place, it is cheaper than shoe-leather, leaving fatigue out of the question; it saves a good two miles of walking, and that is no trifle, especially under a heavy burden, or in slippery weather. In the second place, it may be said to be often cheaper than dirt, seeing that the soil and injury to clothing which it saves by avoiding a two miles' scamper through the muddy ways, would damage the purse of a decent man more than would the cost of several journeys. These are considerations which the humbler classes appreciate, and therefore they flock to the cheap boats, and spend their halfpence to save their pence and their time. This latter consideration of time-saving it is that brings another class of customers to the boats. In order that

it may be remunerative to the projectors, every passage must be made with a regular and undeviating rapidity; and this very necessity becomes in its turn a source of profit, because it is a recommendation to a better class of business men and commercial agents, to whom a saving of time is daily a matter of the utmost importance. Hence the motley mixture of all ranks and orders that crowd the deck.

Besides these half-penny boats, there are others which run at double and quadruple fares; but they carry a different class of passengers, and run greater distances, stopping at intermediate stations. They are all remunerative speculations; and they may be said to have created the traffic by which they thrive. They have driven the watermen's wherries off the river almost as effectually as the railways have driven the stage-coaches from the road; but, like them, they have multiplied the passengers by the thousand, and have awakened the public to a new sense of the value of the river as a means of transit from place to place. The demand for safe, cheap, and speedy conveyance to and from all parts of the river between London Bridge and Battersea, and beyond, is becoming daily more urgent; and we hear that it will shortly be met by the launching of a fleet of steam gondolas constructed on an improved principle, combining accommodation for enlarged numbers, with appliances calculated to insure at once security and speed.

A LONDON NEWSPAPER IN 1667.

In a recent number of this Journal (14th February), some particulars were given relating to a newspaper of a hundred years ago; and the contrast—sufficiently strong—was shewn between the infant press of that time and its developed form in our own. We propose now to make research a century earlier, and to shew in what condition the 'fourth estate of the realm' appeared in the early part of Charles II.'s reign. Surely that great power was then in its very infancy and weakness; and if the subject entered into our plan, it would be both instructive and entertaining to trace its growth in this country from the small beginning now before us.

We have on our table some numbers of the *London Gazette* of 1667 to 1681; and, so far as we know, this newspaper was the only source of information to the people of public and passing events. In the Venetian territory, that republic issued its gazette so early as 1586. In the days of our own Civil Wars, when matters of the last importance were continually arising, the English newspaper commenced, each party having one such organ. Under Cromwell, a more regular journal was published in 1652; but it was not until Queen Anne's reign that the *Daily Courant* appeared each morning, and pioneered that enormous power of our own day which disseminates perhaps 80,000,000 newspapers annually throughout the country.

It would be curious to compare the *London Gazette* of 1667 with the *Times* of 1852. In form, it is slightly larger than one leaf of this Journal; but in type, and in appearance, it is quite equal to the newspapers of a hundred years later. It is published 'by authority,' and contains pithy paragraphs, void of detail and without comment, under the headings of the different places whence the news is brought—the first and the last paragraphs being devoted to 'home news,' the latter dating usually from Whitehall, and supplying the place of the Court Circular. The first number was probably issued shortly after the Restoration, as our earliest date is No. 236, from Thursday, 17th February, to Monday, 20th February 1667. We purpose making some extracts from these veracious records as they arise; and first, let us view in familiar guise a historical character, better known to us by heading charges of cavalry at Naseby—a daring cavalier, a valiant soldier; though now we see him *en déshabille*, and only as Prince Rupert, who, poor

gentleman, has lost his pet dog! 'Lost,' says the advertisement—'lost on Friday last, about noon, a light fallow-colored greyhound, with a sore under her jaw, and a scar on her side; whoever shall give notice of her at Prince Rupert's apartments in Whitehall, shall be well rewarded for their pains.' The next month, we find the prince assisting at a launch. 'This day (3 March), was happily launched at Deptford, in presence of his majesty, his Royal Highness Prince Rupert, and many persons of the court, a very large and well-built ship, which is to carry 106 great guns, and is like to prove a ship of great force and excellent service, called *Charles the Second*.'

A little later, we find an account of the visit of 'Madam,' Duchess of Orleans, and sister to Charles II. Her reception, her return, and her death, follow quickly one upon another; so sudden, indeed, was her decease, that her death was not, says history, without suspicion of poison. 'DOVER, May 21, 1670.—The 15 ins., about 6 in the morning, arrived here Her Royal Highness the Duchess of Orleans, attended, among other persons of quality, by the Marshal de Plessis Praslin; her brother, Bishop of Tournay; Madam de Plessis, the marshal's son's lady; and the Countess of Grammont; having the day before, at about the same hour, embarked with her train upon the men-of-war and several yachts under the command of the Earl of Sandwich, vice-admiral of England, &c.

'The same evening, the court was entertained with a comedy, acted by his Royal Highnesses servants, who attend here for their diversion.'

'Yesterday was acted, by the said servants, another comedy, in the midst whereof Madam and the rest of the ladies were entertained with an excellent banquet.'

In the notice of 5th June, Madam embarked on her return to France. On the 20th, she and the duke arrive at Paris; and on the 25th go to 'St Clou.' The following is the official notice of her death:—

'WHITEHALL.—This day arrived an express from Mr Montague, His Majesty's ambassador at Paris, with the sad news of the death of Madam, His Majesty's only sister, to the infinite grief and affliction of their Majesties' and Royal Highnesses, as well for the greatness of this loss as for the suddenness of it. She died at St Clou about 4 of the clock on Monday morning, of a sudden and violent distemper, which had seized her at 5 of the evening before, and was by her physician taken for a kind of bilious colic.'

Confining ourselves to home news, there appears an edict from Whitehall, commanding the Duke of York's (James II.) absence. 'WHITEHALL, 3 Mar. 1678.—His Majesty, having thought fit to command the Duke to absent himself, his Royal Highness and the Duchess took leave of their majesties, and embarked this morning, intending to pass into Holland.' But three years afterwards, he must have stood better with the city, for in 1681 we find the lord mayor and court of aldermen offering a reward of £500 for the discovery of the person who offered an indignity to the picture of his Royal Highness in the Guildhall, to shew their deep resentment at that 'insolent and villainous act.'

The many allusions to Algerines and pirates of all kinds, and the audacity which seems to mark their acts, are good evidence of the inefficient state of our navy in King Charles's reign. Witness the following extract. 'LYME, April 21, 1679.—Yesterday, a small vessel called the *William and Sarah*, bound for Holland from Morlaix, put in here to avoid two Turks men-of-war, as he very much suspects them to be, because he saw them chase a small vessel, who likewise escaped them. It is reported that some of these pyrrats have been as high as the Isle of Wight, and that Sir Robert Robinson met with five of them, whom he chased into Brest.' There are many accounts of the pirates of Sally (Sallee), and an account of an engagement with one of them by an old collier, called the *Lisborne Merchant*, on

her voyage from London to Lisbon. The description is almost as formidable as Falstaff's with his men of buckram, and we should have liked a little confirmatory evidence beyond the narrator's. All our naval feelings of British supremacy on the water would be gratified by the gallant conduct of our trading captain.

'He had the fortune,' the account declares, 'to be set upon by the admiral of the *Argur*, of 60 guns, and his consort of 40 guns, the former with 700 men, and the latter with 500 men. The admiral immediately boarded the poor merchant, who had only 25 men and 16 guns, clapping on as many men as they thought sufficient to have mastered her. But the English entertained them with so much courage, that they in little time cleared the ship, forcing all the Turks overboard, with little loss besides that of the master of the ship, one seaman, a young man who was knocked on the head.' The Turk repeated his attack, and boarded the merchant; the 'dispute' continues for about three glasses—the admiral assaults them the third time, but his men are so terrified, that only 'seven' durst adventure on board, whereof six were killed, and the other taken prisoner. 'This done, the Turks left her to pursue her course, wearing very eminent marks of that encounter.'

We are at a loss what to make of this report from Dublin; but perhaps some more learned authority can explain it: 'Dublin, April 9, 1679.—This morning the Lord Lieutenant signed a warrant for the pardon of Lawry, a Scotch man, minister in the county of Fermanagh, and his five servants, for killing five notorious Tories in that country, wounding two others to death, as is believed, and taking the eighth. The parson killed three of them with his own hand; and while another of the Tories was going to draw the trigger of his gun to shoot him, his hand was cut off by one of the parson's servants.' Here, again, is a singular announcement to be published 'by authority.'

'A warm report having been spread about of some unusual effects of witchcraft in the province of Daleicary, near the best copper-mines in Suedeland, it is said several persons are sent to make an enquiry in to the matter of fact, with power to proceed to the punishment of such persons as shall be found guilty.' In another number, there has been an inquiry among the Jews in Germany, who were supposed to have sacrificed young children in their ceremonies.

The slow growth of the newspaper press from these times is very remarkable. Even so late as sixty years since, a London paper was a very meagre and timid affair. Before us lies a copy of the *Times* of 1797, insignificant in size and appearance. The small modicum of news is entirely foreign: no brilliant leaders, models of composition—no fearless correction of abuse, or withering sarcasm of folly. The parliamentary debates are merely alluded to as with permission, and the simple propositions said to be advanced and seconded, disputed and amended. How strange is the comparison suggested with the present aspect of the *Times*, or indeed any of the London daylies! We live in an age of wonders, and not the least of these is the well-written, well-filled, and capacious-minded newspapers.

A SCENE IN BOSTON.

A coloured girl, eighteen years of age, a few years ago escaped from slavery in the South. Through scenes of adventure and peril, almost more strange than fiction can create, she found her way to Boston. She obtained employment, secured friends, and became a consistent member of the Methodist church. She became interested in a very worthy young man of her own complexion, who was a member of the same church. They were soon married. Their home, though humble, was the abode of piety and contentment. Industrious, temperate, and frugal, all their wants were supplied. Seven years passed

away. They had two little boys, one six, and the other four years of age. These children, the sons of a free father, but of a mother who had been a slave, by the laws of the Southern States were doomed to their mother's fate. These Boston boys, born beneath the shadow of Faneuil Hall, the sons of a free citizen of Boston, and educated in the Boston Free Schools, were, by the compromises of the constitution, admitted to be slaves, the property of a South Carolinian planter. The Boston father had no right to his own sons. The law, however, had long been considered a dead-letter. This was not to continue. The Fugitive Slave Law was enacted. It revived the hopes of the slave-owners. A young, healthy, energetic mother, with two fine boys, was a rich prize. She would make an excellent mother. Good men began to say: 'We must enforce this law; it is one of the compromises of the constitution.' Christian ministers began to preach: 'The voice of law is the voice of God. There is no higher rule of duty.' As may be supposed, the poor woman was panic-stricken. Her friends gathered around her, and trembled for her. Her husband was absent from home, a seaman on board one of the Liverpool packets. She was afraid to go out of doors, lest some one from the South should see her, and recognise her. One day, as she was going to the grocery for some provisions, her quick anxious eye caught a glimpse of a man prowling around, whom she immediately recognised as from the vicinity of her old home of slavery. Almost fainting with terror, she hastened home, and taking her two children by the hand, fled to the house of a friend. She and her trembling children were hid in the garret. In less than an hour after her escape, the officer, with a writ, came for her arrest. It was a dark and stormy day. The rain, freezing as it fell, swept in floods through the streets of Boston. Night came, cold, black, and tempestuous. At midnight, her friends took her in a hack, and conveyed her, with her children, to the house of her pastor. Hence, after an hour of weeping, for the voice of prayer had passed away into the sublimity of unutterable anguish, they conveyed this mother and her children to one of the Cunard steamers, which fortunately was to sail for Halifax the next day. They took them in the gloom of midnight, through the tempest-swept streets, lest the slave-hunter should meet them. Her brethren and sisters of the church raised a little money from their scanty means to pay her passage, and to save her, for a few days, from starving, after her first arrival in the cold land of strangers. Her husband soon returned to Boston, to find his home desolate, his wife and children exiles in a foreign land. These facts need no word-painting.—*Burritt's Bond of Brotherhood.*

THE TONGUE OF FIRE.

BY MRS NEWTON CROSLAND.

I HEAR December's biting blast,
I see the slippery hail-drops fall—
That shot which frost-sprites laughing cast
In some great Arctic arsenal;
I lean my cheek against the pane,
But start away, it is so chill,
And almost pity tree and plain
For bearing Winter's load of ill.

The sombre sky hangs dark and low,
It looks a couch where mists are born—
A throne whence they in clusters flow,
Or by the tempest's wrath are torn.
I turn me to the chamber's Heart,
Low pulsing like a vague desire,
And strike an ebon block apart,
Till up there springs a Tongue of Fire!

It hath a jovial roaring tone,
Like one rebuking half in jest—
Yet ah! I wish there could be shewn
The wisdom that it hath exprest—

Or sinking to a lambent glow,
Its arched and silent cavern seems
A magic glass whereon to shew,
And shape anew, our broken dreams!

I vow the Fiery Tongue hath caught
Quaint echoes of the passing time;
Thus laughs it at my idle thought,
My longing for a fairer clime:
'So—so you'd like some southern shore,
To gather flowers the winter through,
As if there were on earth no more
For busy human hands to do!

'And guard your Own!—In this, oh mark
High duty and the world's far fate;
Thou art poor deluged Europe's Ark,
Her fortunes on Thy Safety wait;
And—couching lion at her feet—
In all her matron graces drest,
Let free Britannia smiling greet
Her radiant Daughter of the West!

'The broad Atlantic flows between,
But love can bridge the ends of earth;
Of all the lands my race have seen,
These two the rest are more than worth;
Not for their skies, or fruits, or gold,
But for their sturdy growth of Man,
Who walks erect, and will not hold
His life beneath a tyrant's ban.

'Yet do not curl your lips with scorn
That others are not great as ye;
Your fathers fought ere ye were born,
And died that thus it now should be!
I tell ye, spirits walk unseen,
Excepting by the soul's strong sight;
Hampden and Washington, I ween,
Are leaders yet in Freedom's fight!'

It ceased; but oh, Its words of fire
Had dropped upon my Northman's heart,
Rebuked a moment's vain desire,
And slain it like a hunter's dart;
Oh, welcome now the slippery hail,
And welcome winter's biting blast,
Ye brace our sires; they still prevail
Who triumphed through the stormy past.

And as beside the ruddy blaze
We muse or talk of mighty things,
In clarion tone one little phrase
Still through the heart's deep echoes rings:
'Our Hearths—our Homes—beyond compare!'
Those charmed circles whence there rise
The steadfast souls that do and dare,
And shape a Nation's destinies!

There, pile the fagots high—assant—
And let them crackle out their hymn;
There is no logic—that I grant—
In wilful words of woman's whim:
And yet I feel the links that glide
'Twixt English Hearths and Liberty,
And track how We—our truest pride—
First sheltered Her Divinity!

SATURDAY, MAY 29, 1852.

PRICE 1½d.

THEREFORE AND BECAUSE.

A DISTINGUISHED general-officer being appointed to a command in which he would be called on to discharge judicial as well as military duties, expressed to Lord Mansfield his apprehensions, that he would execute his office but ill in the former respect, and that his inexperience and ignorance of technical jurisprudence would prove a serious impediment to his efficient administration of justice. 'Make your mind perfectly easy,' said the great judge; 'trust to your native good sense in forming your opinions, but beware of attempting to state the grounds of your judgments. The judgment will probably be right—the argument infallibly wrong.'

This is a common case, especially with practical men, who rarely have either leisure or inclination to recall the workings of their own minds, or observe the intellectual process by which they have been conducted to any conclusion. By what they are prone to consider as a kind of instinct—if by chance they are philosophers, and delight in what old Wilson, the essayist, calls 'inkhorn terms,' they designate it 'intuition'—they arrive at a truth, but have no recollection whatever of the road they travelled to reach it, and are able neither to retrace their own steps nor indicate to another the way they came. The poet, in describing and contrasting the intellectual characteristics of the two sexes, attributes to the softer something of this instinct as a distinguishing mental peculiarity, and seems to consider it as somewhat analogous in its constitution to those animal senses by means of which the mind becomes cognisant of external objects, of their existence, their qualities, and their relations. In his view, the reasoning process is vitally and essentially distinct, as it is exercised by men and by women—

'Her rapid mind decides while his debates;
She feels a truth which he but calculates.'

And certainly this is a very pretty, very poetical, and very convenient way of accounting for a phenomenon that, if examined with common care, suggests a solution more accurate and complete, if not exactly so complimentary. In sober truth, a positive incapacity clearly to point out the precise manner in which a conviction has been formed, is one of the commonest of logical deficiencies, and no more to be ascribed exclusively to the softer sex, than it is an attribute of intellectual excellency in either.

When, in Euripides's beautiful play, the untranslatable *Hippolytus*, Phœdra's nurse is made to conclude that ~~certain~~ ^{careless} men she refers to cannot be otherwise than lax in their morals, because they have finished the roofs of their houses in a very imperfect manner, her reasoning

is inconsequential enough; but not more so than that of the renowned French chancellor, Michael L'Hôpital, who, when employed in negotiating a treaty between Charles IX. and our Elizabeth, insisted on the well-known line of the Latin poet—

'Et penitus toto divisos orbe Britannos,'

as a reason that Calais should not be returned to the English. The connection between the premises and the conclusion was not more real in one case than in the other. A learned member of the medical profession, in an elaborate work on the climate and the people of Malta, enjoins on the invalid a participation in the amusements of cheerful society; and the propriety of his injunction few will be disposed to dispute: they may well, however, marvel at the reason he assigns for such sensible advice—that, so far as invalids are concerned, society has a direct tendency to promote cutaneous perspiration!

Cardinal de Retz severely reprehends the historians of his time for their pedantic affectation of explaining and accounting for every event they record—the motives that actuated this statesman, the reasons which prompted that policy, the wherefore it was this enterprise miscarried, or that undertaking brought to a successful issue. It would not be difficult to furnish a lengthy catalogue of the blunders historical writers have perpetrated through their overweening addiction to this folly. Let two instances here suffice: When the Roman Church, about the middle of the eleventh century, was endeavouring to insure the celibacy of its priesthood, the married clergy, who braved its censures and contemned its authority, became known as *Nicolaïtes*; which name, grave writers assure us, was given them in consequence of the active share Pope Nicholas II. had taken in punishing their contumacy and effecting their suppression. The notion that any sect or class of religionists should have borrowed its name from that of its most zealous opponent and indefatigable persecutor, is worthy only of those critics, so severely reprehended by Quintilian, who professed to discover the etymon of the Latin word *lucus*, a grove, in the substantive *lux*, light; and vindicated the derivation on the ground, that in groves darkness usually prevailed. The familiar expression of *lucus à non lucendo*, owes its birth to this striking manifestation of critical sagacity.

Again: a certain portion of the eastern and southern coast of England was, in early times, denominated 'the Saxon Shore'—Littus Saxonicum—and was, during the days of Roman supremacy, under the government of a military court enjoying the appellative of *Comes Littoris Saxonici*. Acute historical critics inform us, that this

tract was so denominated in consequence of its being open to the aggressions of the Saxons; that, in short, it received its name from its occasional invaders, and not from its permanent inhabitants. The absurdity of this explanation is the greater, inasmuch as, on the other side of the Channel, there was a large district bearing precisely the same name, and settled entirely by adventurers, Saxon in birth or by descent. This, one would have thought, would have suggested to our English antiquaries a more probable explanation of the name than that they adopted. The people of Genoa have, or had, in speaking, a peculiar way of clipping or cutting short their syllables. Their Italian has never been considered pure. You must not go to maritime towns for purity of language, especially to such as have been long and extensively engaged in commercial pursuits. Labat, however, gives a special and peculiar reason for the fashion of mutilated speech in which, he declares, the Genoese indulge, telling us they call their superb city *Gena*, and not *Genoa*. He refers their 'chopping' pronunciation to their habitual economy—an economy distinctly traceable to their mercantile habits. 'Telle est leur économie,' he says, 'ils rognent tout jusqu'aux paroles.'

The old English law-writer, Bracton, desiring to account for the ancient doctrine of English law, that inheritances shall lineally descend, and never lineally ascend, finds a reason in the fact, that a bowl being trundled, runs down a hill and never up a hill; and Littleton, the first great writer on English real property-law, traces the origin of the phrase 'hotchpot'—a familiar legal term—to the archaic denomination of a pudding, in our English tongue. 'It seemeth,' he says, 'that this word, hotchpot, is in English a pudding; for in this pudding is not commonly put one thing alone, and therefore it behoveth, in this case, to put the lands given in frank-marriage,' &c. Erasmus used to say of lawyers, that of ignorant people, they were the most learned. Questionless they are not always sound logicians. When the clown in Hamlet disserts so learnedly on 'crown's quest-law,' he is only parodying, and that closely, a scarcely less ludicrous judgment which had actually been pronounced, not long before, in the Court of Queen's Bench: Dr Clarke, the traveller, tells an amusing story to the purpose. According to him, the Turkish lawyers recognise as an offence what they style 'homicide by an intermediate cause'—an instance of which offence our traveller details in these words: 'A young man, desperately in love with a girl of Stanchio—the ancient Cos, the birthplace of Hippocrates and Apelles, the lovely isle renowned for its lettuces and turpentine—eagerly sought to marry her. But his proposals were rejected. In consequence, he destroyed himself by poison. The Turkish police arrested the father of the obdurate fairy, and tried him for culpable homicide. "If the accused," they argued, with becoming gravity, "had not had a daughter, the deceased would not have fallen in love; consequently, he would not have been disappointed; consequently, he would not have died: but he (the accused) had a daughter, and the deceased had fallen in love," &c. &c. Upon all these counts he was called upon to pay the price of the young man's life; and this, being eighty piastres, was accordingly exacted.' When the amiable and gentle John Evelyn was in the Netherlands, a woman was pointed out to him who had had twenty-five husbands, and was then a widow; 'yet it could not be proved,' he says,

that 'she had made any of her husbands away, though the suspicion had brought her several times to trouble.' However, the Dutch logicians made no difficulty of the matter; and arguing, from the number of the woman's husbands, that she could not be wholly innocent of their death, prohibited her from marrying again—which, her addiction to matrimony being considered, was perhaps, of all the 'troubles' she had undergone, by no means the least.

The logical faculty, which not only consists with the poetical, but is invariably and necessarily associated with it, whenever the latter exists in an advanced stage of development, is in no writer more conspicuous as an intellectual characteristic than in Schiller. In this respect he is not excelled even by Wordsworth himself; but Homer sometimes snoozes, and Schiller's reasoning is not always consequential: as, for instance, when he denies two compositions of Ovid—the *Tristia* and *Ex Ponto*—to be genuine poetry, on the ground that they were the results not of inspiration, but of necessity; just as if poetry were not a thing to be judged of by itself; and as if one could not determine whether it were present or absent in a composition, without knowing to what influences the author was subjected at the time the composition was produced!

Rousseau, in one of his moods of bilious cynicism, falls foul of human reason altogether. No man despised it more in action; no one could more consistently decry it in speculation. In his opinion, the exercise of the reasoning powers is absolutely sinful—*l'homme qui raisonne est l'homme qui pèche*. Franklin, on the other hand, in a familiar tone of playful banter, vindicates its utility, alleging that it is mightily 'convenient to be a rational animal, who knows how to find or invent a plausible pretext for whatever it has an inclination to do.' Examples of this convenience abound. The Barbary Jews were rich and industrious, and, accordingly, their wealth provoke the cupidity of the indolent and avaricious Mussulmans. These latter, whenever a long drought had destroyed vegetation, and the strenuous prayers offered up in the mosques had proved unavailing for its removal, were accustomed to argue—and a mighty convenient argument it was—that it was the foul breath of the Jews that had offended Heaven, and rendered the pious petitions of the faithful of none effect. The remedy for the drought, then, who could doubt? The true believers drove the Jews out of their cities, and quietly confiscated their goods. Dryden, anxious to congratulate Charles II. on his 'happy restoration,' amidst a thousand fulsome compliments—all tending to shew that that prince was the author of blessings, not only to his own kingdoms, but to universal humanity—declares, that it was to Charles, and to him only, Spain was indebted for her magnificent colonial possessions in either hemisphere. Addressing the sovereign, his words are—

'Spain to your gift alone her Indies owes,
For what the powerful takes not, he bestows.'

A convenient fashion of reasoning truly: as convenient every whit as that of Daniel Burgess, a witty Presbyterian minister, devoted to the House of Brunswick and the principles of the Revolution, who was wont to affirm, as the reason the descendants of Jacob were called Israelites, and did not receive the original name of their progenitor, that Heaven was unwilling they should bear a name in every way so odious as that of Jacobites.

Once more: it appears from Dr Tschudi's valuable and interesting work on South America, that in Peru rice is cheap, and servants both lazy and dirty. Now, the servants in Lima have a theory about rice. They consider it possesses certain qualities antagonistic to water, so that, after eating, to touch water would be seriously injurious to health; and thus does their frequent consumption of rice supply them with a most

convenient reason or excuse for their habitual abstinence from an operation they detest—that of washing their hands.

Verily, they are mighty fine and convenient words, THEREFORE and BECAUSE.

DAVID'S LAST PICTURE.

THE whole population of the good city of Brussels was in a state of excitement. Talma, the great French tragedian, was that evening to close his engagement by appearing in his favourite character of Leonidas; and from an early hour in the morning, the doors of the theatre were beset with waiting crowds, extending to the very end of the large square in which it stood. It was evident that the building, spacious as it was, could not contain one-half of the eager expectants already assembled, and yet every moment brought a fresh accession to the number destined to be disappointed. The hero of this ovation, and the object of all this unusual excitement to the worthy and naturally phlegmatic beer-drinkers of old Brabant, was standing near a window in the White Cross Hotel, engaged most prosaically in shaving himself; and, from time to time, casting on the crowd, to which he was the magnet of attraction, the careless glance of a monarch become from habit almost insensible to the loyal enthusiasm of his subjects.

'So he will not come?' said the tragedian to an old friend who was with him. 'He is a cynical old fool; and yet, I assure you, my dear M. Lesec, that I had Leonidas got up expressly for him, thinking to tickle his old republican fancies, for to my mind it is as stupid a play as *Germanicus*, though I contrive to produce an effect with some of its high-sounding patriotic passages; and I thought the worthy David would have recognised his own picture vivified. But he will not come: he positively refused, you tell me. I might have known it. Age, exile, the memory of the past—all this has cut him up terribly: he is the David of the Consulate no longer.'

'I am just come from him,' answered Collector Lesec: 'he received me almost as Hermione receives Orestes in the fourth act of *Andromache*. To say the least of it, he was somewhat tart. "I never go to the theatre," he answered abruptly. "Tell my friend Talma, that I thank him for his kindness; but I always go to bed at nine. I should be very glad if he would come, before he left Brussels, and have a tankard and a smoke with me."'

'I see,' said Talma with a half-ironical smile, 'he is turned quite Flemish. Poor fellow! to what has he come?—to smoking tobacco, and losing all faith in art. Persecution does more harm than the guillotine,' added the tragedian in a tone of bitterness. 'There is a living death. David's exile has deprived us of many a *chef-d'œuvre*. I can forgive the Restoration for surrounding itself with nobodies, but it need not banish our men of talent: they are not to be found now-a-days in every corner. But enough. Another word, and we should be talking politics.'

Leonidas finished shaving like any other man; and then turned suddenly to his friend: 'I bet you ten napoleons,' said he, 'that David would have come to the play had I gone myself to him with the invitation! I intended it, but I had not time; these rehearsals kill me—I might as well be a galley-slave. However, I have about three-quarters of an hour to myself now, and I will go beard the old Roman in his stronghold. What say you to going with me?'

It would have been difficult to name a place to which M. Lesec would not have gone, to have the honour of being seen arm-in-arm with the great Talma; and in another half hour they were on their way across the Place de la Monnaie into the Rue Pierre Plate.

'Now for a storm!' said Lesec. 'We are in for it:

so be prepared. I leave it all on your shoulders, noble sir, for I must keep clear of him.'

'Is he, then, so entirely changed?' exclaimed Talma, quickening his pace. 'Poor exile! unhappy genius! torn from thy native soil, to languish and die!'

The visitors soon reached the large, though somewhat dilapidated mansion of the celebrated artist; and after they had been reconnoitred through a small grating by an old female servant, they were ushered into a rather gloomy apartment, presenting a singular discrepancy between its antique decorations and modern furniture.

The illustrious exile came out of an adjoining apartment in his dressing-gown, and advanced towards them with a quick yet almost majestic step, though his form was slightly bent, apparently by age. To Talma's great surprise, David received him most cordially, even throwing away his usually inseparable companion, a long pipe, to grasp both his hands. 'Welcome, welcome, my old friend!' he said; 'you could not have come at a better time. I have not for many a day felt so happy, and the sight of you is a great addition.' And the old painter kept rubbing his hands, a token with him of exuberant satisfaction.

Talma looked at Lesec as much as to say: 'The devil is not quite so black as he is painted;' while the worthy collector only shrugged his shoulders, and lifted his eyebrows in pantomimic expression of his inability to comprehend such a sudden change in the atmosphere.

'You must promise to come and dine with me to-morrow,' continued the painter, accompanying his invitation with a smile, or rather a grin, for David's face was very much disfigured by a wen on his cheek, which also, by causing a twitching of the jaw, rendered his articulation indistinct.

'To my great regret, I am obliged to decline your invitation, my dear friend,' said Talma. 'This is my last night here, and I must set off for Paris to-morrow.'

'Set off to-morrow!'

'Positively. Michelet and Dumas have the whole management on their shoulders, and are pressing my return; and Lemercier is only waiting for me to read to us a sort of *Richard the Third*.'

'Nevertheless, you dine with me to-morrow. One day longer will not matter to them, and is a great matter to me. I suspect Lemercier's *Richard the Third* is cold enough to keep a little longer. I am to have my friend Giroud with me; so dine with us you must. It will make me grow young again, man, and bring back the happy meetings at Moliker's, near the gate of the Louvre.'

The illustrious exile accompanied this sentence with another of his grim smiles. The actor was deeply moved by it, for in that bitter smile he read how the artist pined for his country. 'I will stay with you, I will stay with you, dear David!' now eagerly cried Talma. 'For your sake, I will desert my post, and steal a holiday from my Paris friends; but it can only be on condition that you, too, will make a little sacrifice for me, and come this evening to see me in Leonidas.'

'Well, I don't care if I do,' answered the painter, whom the sight of one friend, and the expectation of seeing another, had made quite a different being from the David of the morning. 'Here goes for Leonidas; but, remember, I give you fair warning—I shall go to sleep. I have scarcely ever been in a theatre that I did not take a sound nap.'

'But when Talma plays, plaudits will keep you awake, M. David,' said the courtly M. Lesec; and this seasonable compliment obtained for him a smile, and an invitation for the next day, so flattering to his vanity that, even at the risk of compromising himself with the Prince of Orange, he unhesitatingly accepted.

That evening, between six and seven o'clock, the old

French painter, a Baron of the Empire, entered the theatre in full dress, and with a new red ribbon in his button-hole; but, as if shrinking from notice, he took his seat at the back of the stage-box, reserved for him by his friend Talma, with M. Lesec by his side, prouder, more elated, more frizzled and befrilled, than if he had been appointed first-commissioner of finance. But notwithstanding all the care of the modest artist to preserve his incognito, it was soon whispered through the theatre that he was one of the audience; and it was not long before he was pointed out, when instantly the whole house stood up respectfully, and repeated cheers echoed from pit to vaulted roof. The prince himself was among the first to offer this tribute to the illustrious exile, who, confused, agitated, and scarcely able to restrain his tears, bowed to the audience rather awkwardly, as he whispered to M. Lesec: 'So, then, I am still remembered. I thought no one at Brussels cared whether I was dead or alive.'

Soon Talma appeared as Leonidas; and in his turn engrossed every eye, every thought of that vast assembly. A triple round of applause hailed every speech uttered by the generous Spartan. The painter of the Sabines, of Brutus, of the Horatii, of the Coronation, seemed to heed neither the noisy acclamations nor the deep silence that succeeded each other. Mute, motionless, transfixed, he heard not the plaudits: it was not Talma he saw, not Talma he was listening to. He was at Thermopylæ, by the side of Leonidas himself; ready to die with him and his three hundred heroes. Never had he been so deeply moved. He had talked of sleep, but he was as much alive, as eager, as animated, as if he were an actual sharer in the heroic devotedness that was the subject of the drama. For some moments after the curtain fell, he seemed equally absorbed; it was not till he was out of the theatre, and in the street, that he recovered sufficiently to speak; and then it was only to repeat every five minutes: 'What a noble talent it is! What a power he has had over me!'

A night of tranquil sleep, and dreams of bright happy days, closed an evening of such agreeable excitement to the poor exile; and so cheering was its effect upon him, that he was up the next morning before day, and his old servant, to her surprise, saw her usually gloomy and taciturn master looking almost gay while charging her to have breakfast ready, and to be sure that dinner was in every way befitting the honoured guests he expected.

'And are you going out, sir, and so early?' exclaimed the old woman; now, for the first time, perceiving that her master had his hat on and his cane in his hand.

'Yes, Dame Rebecca,' answered David, as he gained the outer gate. 'I have grown a great boy, and may be trusted to go alone.'

'But it is scarcely daylight yet. None of the shops are open.'

'I do not want to make any purchases.'

'Then, where in the world can you be going, sir, at this hour?'

'*Sacre bleu!*' returned the painter, losing all patience: 'could you not guess, you old fool, that I am going as far as the Flanders-gate to meet my old friend Girodet?'

'O that, indeed! But are you sure he will come that way? And did he tell you the exact time?'

'What matter, you old torment? Suppose I have to wait a few minutes for him, I can walk up and down, and it will be exercise for me, which, you know, Dr Fanchet has desired me to take. Go along in, and don't let the dinner be spoiled.' And the old man went on his way with an almost elastic step. Once more was he young, gay, happy. Was he not soon to see the friend dearer to him than all the world? But his eagerness had made him anticipate by two hours the

usual time for the arrival of the diligence, and he was not made aware of his miscalculation till after he had been a good while pacing up and down the suburb leading to the Flanders-gate. The constant companion alike of his studio and his exile, his pipe, he had left behind him, forgotten in his hurry; so that he had no resource but to continue his solitary walk, the current of his happy thoughts flowing on, meanwhile, uninterrupted, save by an occasional greeting from labourers going to their work, or the countrywomen hastening, as much as their Flemish *embonpoint* would allow, to the city markets. When sauntering about alone, especially when waiting, we, like children, make the most of everything that can while away the time, or give even the semblance of being occupied: a flower-pot in a window, a parrot in a cage, nay, even an insect flying past, is an absolute gain to us. David felt it quite a fortunate chance when he suddenly caught sight of a sign-painter carrying on his work in the open air. Though evidently more of a whitewasher than a painter, yet, from the top of his ladder, he was flourishing his brush in a masterly style, and at times pausing and contemplating his work with as much complacency as Gros could have done his wonderful cupola of Sainte-Genève.

The painter of Napoleon passed the self-satisfied dauber twice, not without some admiring glances at the way in which he was plastering the background of his landscape with indigo, by way of making a sky. At top of the sign, now nearly finished, was traced, in large characters, 'Break of Day;' a precaution as indispensable to point out the artist's design, as the inscription, 'Dutch and Flemish Beer,' was to announce the articles dealt in by the owner of the house upon which this masterpiece was to figure.

'Here's a pretty fellow!' said the artist to himself; 'with as much knowledge of perspective as a cart-horse; and yet, I doubt not, thinking himself a second Rubens. He brushes away as if he were polishing a pair of boots. And what matter? Why should he not enjoy himself in his own way?' But when he passed the ladder for the third time, and saw a fresh layer of indigo putting over the first, his patience could hold out no longer, and he exclaimed, without stopping or even looking at the offender: 'There is too much blue!'

'Eh! Do you want anything, sir?' said the sign-painter; but he who had ventured the criticism was already at a distance.

Again, David passed by. Another glance at the 'Break of Day,' and another exclamation: 'Too much blue, you blockhead!' The insulted plasterer turned round to reconnoitre the speaker, and as if concluding, from his appearance, that he could be no very great connoisseur, he quietly set to work again, shrugging his shoulders in wonder how it could possibly be any business of his whether the sky was red, green, or blue. For the fourth time the unknown lounge repeated his unwelcome criticism: 'Too much blue!'

The Brussels Wouvermans coloured, but said, in the subdued tone of a man wishing to conceal anger he cannot help feeling: 'The gentleman may not be aware that I am painting a sky.' By this time he had come down from the ladder, and was standing surveying his work with one eye closed, and at the proper distance from it to judge of its effect; and his look of evident exultation shewed that nothing could be more ill-timed than any depreciation of his labours.

'It is because I suppose you do want to paint a sky, that for that very reason I wished to give you this little piece of advice, and to tell you that there is too much blue in it.'

'And pray, Mr Amateur, when was there ever a sky seen without blue?'

'I am no amateur; but I tell you once more, that there is too much blue. And now do as you like; and if you do not think you have enough, you can put more.'

'This is entirely too bad!' cried the now exasperated sign-painter. 'You are an old fool, and know nothing of painting. I should like to see you make a sky without blue.'

'I do not say I am a good hand at a sky; but if I did set about it, there should be no blue.'

'A pretty job it would be!'

'It would look like something, at all events.'

'That is as much as to say mine is like nothing at all.'

'No indeed, for it is very like a dish of spinach, and very like a vile daub, or like anything else you please.'

'A dish of spinach! a vile daub!' cried the artist of Brabant in a rage. 'I, the pupil of Ruysdael—I, fourth cousin to Gerard Dow! and you pretend to know more of my art than I do—an art I have practised with such credit at Antwerp, Louvain, and Liege! A dish of spinach, indeed!' And by this time the fury of the insulted painter had increased to such a degree, that he seized David by the arm, and shaking him violently, added: 'Do you know, you old dotard, that my character has been long established? I have a red horse at Mechlin, a stag at Namur, and a Charlemagne at Aix-la-Chapelle, that no one has ever seen without admiring!'

'This is beyond all patience,' said David; and suddenly extricating himself from the man's grasp, and snatching his palette from him, he was up the ladder in an instant, shouting: 'Wait awhile, and you shall have yourself to admire, with your fool's pate and your ass's ears!'

'Stop, stop, you villain!' roared the luckless artist, pale with consternation. 'My splendid sign! A painting worth thirty-five francs! I am ruined and undone!' And he continued shaking the ladder, and pouring out a torrent of abuse upon David, who, caring neither for the reproaches of his victim, nor for the crowd that the sudden clamour had attracted, went on pitilessly effacing the 'Break of Day,' and mingling in one confused mass sky and sun, and trees and figures; or what was intended, at least, to represent them. And now—not less rapid in creating than in destroying—and with the lightest possible touch of his brush, the new sign-painter sketched and finished, with magic rapidity, a sky with the gray tints of early dawn, and a group of three men, glass in hand, watching the rising sun; one of these figures being a striking likeness of the whitewasher, shewn at once by his bushy eyebrows and snub-nose.

The crowd, that had at first shewn every inclination to take the part of their countryman against a stranger unfairly interfering with him, now stood quietly watching the outlines as they shone through the first layers of colour, and shouts of applause burst from them as the figures grew beneath the creative hand of the artist. The tavern-keeper himself now swelled the number of admirers, having come out to ascertain the cause of the tumult; and even the fourth-cousin of Gerard Dow felt his fury fast changing into admiration.

'I see it all now,' he said to those nearest him in the crowd. 'He is a French or Dutch sign-painter, one of ourselves, and he only wanted to have a joke against me. It is but fair to own that he has the real knack, and paints even better than I do.'

The artist to whom this equivocal compliment was paid, was now coming down from the ladder amid the cheers of the spectators, when a new admirer was added to them in the person of a man who, mounted on a fine English horse, seemed inclined to ride over the crowd in his eagerness to get a good view of the painting.

'That picture is mine!' he exclaimed; 'I will have it. I will buy it, even if I have to cover it with guineas!'

'What do you mean?' asked the tavern-keeper.

'I mean, that I will give any price you choose to name for that sign,' answered the stranger.

'The picture is not to be sold, young man; I could not think of parting with it,' said the whitewasher with as much paternal pride as if it had been indeed his workmanship.

'Certainly not,' said the vender of beer; 'for it has been already sold, and partly paid for in advance. The picture is mine; and, though not very anxious to dispose of it, yet, perhaps, we may come to some understanding, and make a bargain.'

'Not so fast,' said the dauber; 'the sign belongs to me, and my brother-artist was only kindly giving me a helping-hand. It is my lawful property; and if this gentleman wants to buy it, he must deal with me for it.'

'I tell you,' replied the tavern-keeper, 'that the "Break of Day" is my property, as sure as it is now hanging in front of my house.'

The dispute was waxing louder and louder, when David broke in: 'And am I to go for nothing in the matter? Methinks I might be allowed a voice in it.'

'And a good right you have, brother,' said the sign-painter; 'and I am sure you and I shall have no difference about it. But the open street is no place for all this. We had better go into the house, and settle the matter over a pot of beer.'

David, wishing to escape the continually increasing crowd, consented to the adjournment, which, however, had no effect upon the disputants, and the contest waged more fiercely than ever; nor did the Englishman's reiterated offers to give for the picture its weight in gold tend to allay it.

'But what will you say, if I won't let it be sold?' cried David, at length losing all patience.

'Ah, good sir,' said the tavern-keeper, 'you would not deprive a poor, struggling man like me of this opening for getting a little ready money to enable me to lay in a stock of beer. As for that sign-painter, he is a drunken sot, who has left himself without as much as a stiver to give his daughter, who ought to have been married a year ago.'

'Do not believe him, sir,' cried David's brother-artist. 'Every one knows there is not a fonder father in the whole town; and more shame to me if I were not, for never was there such a good daughter as my dear, pretty Lizette. I have no money to give her, to be sure, but she is betrothed to an honest fellow, who is glad to get her, poor as she is. He is a young Frenchman, a cabinet-maker, and no better workman in the whole city; and they are to be married whenever he has anything saved.'

'A good child, and a good workman, and only waiting for wherewithal to live! This alters the matter entirely,' said David; 'and the young couple shall have the picture. We leave it to this gentleman's liberality to name the price he is willing to give for it.'

'Illustrious artist,' said the Englishman, 'I rejoice in the decision you have come to: Solomon himself could not have given a wiser one. As for me, I have already offered a hundred guineas for the sign as it stands; but I will give two hundred, if you will consent to inscribe on it the two words "Pierre David."'

The name was no sooner pronounced, than a cry of astonishment and delight burst from all present; and the poor sign-painter, with tears in his eyes, implored pardon for all his rudeness and presumption, and poured out grateful thanks for the Master's kind intentions in favour of the young couple.

By this time the news had reached the crowd without, and was received with repeated shouts, and cries of 'Long live David!' 'Long live the prince of artists!' But the cheers became almost deafening, when the pretty Lizette, having heard the wonderful story of a sign having been painted that was to hasten her marriage, and give her a dowry of 200 guineas, made her appearance, and, without a moment's hesitation, threw her arms about the neck of her benefactor, who

returned her caresses most cordially ; declaring that, all things considered, he did not know any one who had a better right to a kiss from the bride.

At this instant Talma, followed by Girodet and the collector, hurriedly entered the tavern. Not finding David at his house, and being told of his having left home very early, they became uneasy lest some accident had befallen him, and set off in search of him.

'Thank Heaven, we have found him !' said Girodet.

'And very well employed, too, I declare,' cried Talma. 'If I could be sure of meeting such a kind welcome from a pretty girl, I should not mind getting up early myself !'

'Bravo, bravo, my old friend !' said Girodet, as, after a warm embrace from him, he turned to examine the picture : 'I never expected to hear of your changing your style, and turning Flemish sign-painter. But it is no shame for David to end as Rembrandt began.'

ADMIRAL BLAKE.*

A good biography is ever welcome ; and if it be the biography of a good and a great man, the cordiality of the *bienvenu* is doubled. Mr Prescott remarks,† that there is no kind of writing, having truth and instruction for its main object, which, on the whole, is so interesting and popular as biography : its superiority, in this point of view, to history, consisting in the fact, that the latter has to deal with masses—with nations, which, like corporate societies, seem to have no soul, and whose chequered vicissitudes may be contemplated rather with curiosity for the lessons they convey, than with personal sympathy. Among contemporary biographers, Mr Hepworth Dixon has already established for himself a name of some distinction by his popular lives of William Penn and John Howard ; nor will his credit suffer a decline in the instance of the memoir now before us—that of the gallant and single-minded patriot, Robert Blake. Of this fine old English worthy, republican as he was, the Tory Hume freely affirms, that never man, so zealous for a faction, was so much respected and even esteemed by his opponents. 'Disinterested, generous, liberal ; ambitious only of true glory, dreadful only to his avowed enemies ; he forms one of the most perfect characters of the age, and the least stained with those errors and vices which were then so predominant.'‡ Yet hitherto the records of this remarkable man have been scanty in matter, and scattered in form—the most notable being Dr Johnson's sketch in the *Gentleman's Magazine*, and another in the *Encyclopædia Britannica*. Mr Dixon has consulted several scarce works, of genuine though obsolete authority, and a large mass of original documents and family papers, in preparing the present able and attractive memoir ; not omitting a careful examination of the squibs, satires, and broadsides of that time, in his endeavour to trace, in forgotten nooks and corners, the anecdotes and details requisite, as he says, to complete a character thus far chiefly known by a few heroic outlines. We propose taking a brief survey of his life-history of the great admiral and general at sea—the 'Puritan Sea-King,' as Mr Dixon more characteristically than accurately calls his hero. A seaking he was, every inch of him ; but to dub him Puritan, is like giving up to party what was meant for British mankind. To many, the term suggests primarily a habit of speaking through the nose ; and Blake had thundered commands through too many a piping gale and battle blast for that.

Robert Blake was born at Bridgewater, in August 1599. His father, Humphrey Blake, was a merchant

trading with Spain—a man whose temper seems to have been too sanguine and adventurous for the ordinary action of trade, finally involving him in difficulties which clouded his latter days, and left his family in straitened circumstances : his name, however, was held in general respect ; and we find that he lived in one of the best houses in Bridgewater, and twice filled the chair of its chief magistrate. The perils to which mercantile enterprise was then liable—the chance escapes and valorous deeds which the successful adventurer had to tell his friends and children on the dark winter nights—doubtless formed a part of the food on which the imagination of young Blake, 'silent and thoughtful from his childhood,' was fed in the 'old house at home.' At the Bridgewater grammar-school, Robert received his early education, making tolerable acquaintance with Latin and Greek, and acquiring a strong bias towards a literary life. This *penchant* was confirmed by his subsequent career at Oxford, where he matriculated at sixteen, and where he strove hard but fruitlessly for scholarships and fellowships at different colleges. His failure to obtain a Merton fellowship has been attributed to a crotchet of the warden's, Sir Henry Savile, in favour of tall men : 'The young Somersetshire student, thick-set, fair complexioned, and only five feet six, fell below his standard of manly beauty ;' and thus the Cavalier warden, in denying this aspirant the means of cultivating literature on a little university oatmeal, was turning back on the world one who was fated to become a republican power of the age. This shining light, instead of comfortably and obscurely merging in a petty constellation of Alma Mater, was to become a bright particular star, and dwell apart. The avowed liberalism of Robert may, however, have done more in reality to shock Sir Henry, than his inability to add a cubit to his stature. It is pleasant to know, that the 'admiral and general at sea' never outgrew a tenderness for literature—his first-love, despite the rebuff of his advances. Even in the busiest turmoil of a life teeming with accidents by flood and field, he made it a point of pride not to forget his favourite classics. Nor was it till after nine years' experience of college-life, and when his father was no longer able to manage his *res angusta vita*, that Robert finally abandoned his long-cherished plans, and retired with a sigh and last adieu from the banks of the Isis.

When he returned to Bridgewater, in time to close his father's eyes, and superintend the arrangements of the family, he was already remarkable for that 'iron will, that grave demeanour, that free and dauntless spirit,' which so distinguished his after-course. His tastes were simple, his manners somewhat bluntly austere ; a refined dignity of countenance, and a picturesque vigour of conversation, invested him with a social interest, to which his indignant invectives against court corruptions gave distinctive character. To the Short Parliament he was sent as member for his native town ; and in 1645, was returned by Taunton to the Long Parliament. At the dissolution of the former, which he regarded as a signal for action, he began to prepare arms against the king ; his being one of the first troops in the field, and engaged in almost every action of importance in the western counties. His superiority to the men about him lay in the 'marvellous fertility, energy, and comprehensiveness of his military genius.' Prince Rupert alone, in the Royalist camp, could rival him as a 'partisan soldier.' His first distinguished exploit was his defence of Prior's Hill fort, at the siege of Bristol—which contrasts so remarkably with the pusillanimity of his chief, Colonel Fiennes. Next comes his yet more brilliant defence of Lyme—then a little fishing-town, with some 900 inhabitants, of which the defences were a dry ditch, a few hastily-formed earth-works, and three small batteries, but which the Cavalier host of Prince Maurice, trying storm, stratagem, blockade, day after day, and week

* *Robert Blake: Admiral and General at Sea.* By Hepworth Dixon. London : Chapman and Hall. 1852.

‡ *History of Great Britain*, c. lxi.

after week, failed to reduce or dishearten. 'At Oxford, where Charles then was, the affair was an inexplicable marvel and mystery: every hour the court expected to hear that the "little vile fishing-town," as Clarendon contemptuously calls it, had fallen, and that Maurice had marched away to enterprises of greater moment; but every post brought word to the wondering council, that Colonel Blake still held out, and that his spirited defence was rousing and rallying the dispersed adherents of Parliament in those parts.' After the siege was raised, the Royalists found that more men of gentle blood had fallen under Blake's fire at Lyme, than in all the other sieges and skirmishes in the western counties since the opening of the war. The details of the siege are given with graphic effect by Mr Dixon, and are only surpassed in interest by those connected with Blake's subsequent and yet more celebrated defence of Taunton, to which the third chapter of this biography is devoted.

The hero's fame had become a spell in the west: it was seen that he rivalled Rupert in rapid and brilliant execution, and excelled him in the caution and sagacity of his plans. He took Taunton—a place so important at that juncture, as standing on and controlling the great western highway—in July 1644, within a week of Cromwell's defeat of Rupert at Marston Moor. All the vigour of the Royalists was brought to bear on the captured town; Blake's defence of which is justly characterised as abounding with deeds of individual heroism—exhibiting in its master-mind a rare combination of civil and military genius. The spectacle of an unwall'd town, in an inland district, with no single advantage of site, surrounded by powerful castles and garrisons, and invested by an enemy brave, watchful, numerous, and well provided with artillery, successfully resisting storm, strait, and blockade for several months, thus paralysing the king's power, and affording Cromwell time to remodel the army, naturally arrested the attention of military writers at that time; and French authors of this class bestowed on Taunton the name of the modern Saguntum. The rage of the Royalists at this prolonged resistance was extreme. Reckoning from the date when Blake first seized the town, to that of Goring's final retreat, the defence lasted exactly a year, and under circumstances of almost overwhelming difficulty to the besieged party, who, in addition to the fatigue of nightly watches, and the destruction of daily conflicts, suffered from terrible scarcity of provisions. 'Not a day passed without a fire; sometimes eight or ten houses were burning at the same moment; and in the midst of all the fear, horror, and confusion incident to such disasters, Blake and his little garrison had to meet the storming-parties of an enemy brave, exasperated, and ten times their own strength. But every inch of ground was gallantly defended. A broad belt of ruined cottages and gardens was gradually formed between the besiegers and the besieged; and on the heaps of broken walls and burnt rafters, the obstinate contest was renewed from day to day.' At last relief arrived from London; and Goring, in savage dudgeon, beat a retreat, notwithstanding the wild oath he had registered, either to reduce that haughty town, or to lay his bones in its trenches.

Blake was now the observed of all observers; but, unlike most of his compeers, he abstained from using his advantages for purposes of selfish or personal aggrandisement. He kept aloof from the 'centre of intrigues,' and remained at his post, 'doing his duty humbly and faithfully at a distance from Westminster; while other men, with less than half his claims, were asking and obtaining the highest honours and rewards from a grateful and lavish country.' Nor, indeed, did he at any time side with the ultras of his party, but loudly disapproved of the policy of the regicides. This, coupled with his influence, so greatly deserved and so

deservedly great, made him an object of jealousy with Cromwell and his party; and it was owing, perhaps, to their anxiety to keep him removed from the home-sphere of action, that the hero of Taunton was now appointed to the chief naval command.

Hitherto, and for years afterwards, no state, ancient or modern, as Macaulay points out, had made a separation between the military and the naval service. Cimon and Lysander, Pompey and Agrippa, had fought by sea as well as by land: at Flodden, the right wing of the English was led by her admiral, and the French admiral led the Huguenots at Jarnac, &c. Accordingly, Blake was summoned from his pacific government at Taunton, to assume the post of 'General and Admiral at Sea;' a title afterwards changed to 'General of the Fleet.' Two others were associated with him in the command; but Blake seems at least to have been recognised as *primus inter pares*. The navy system was in deplorable need of reform; and a reformer it found in Robert Blake, from the very day he became an admiral. His care for the well-being of his men made him an object of their almost adoring attachment. From first to last, he stood alone as England's model-seaman. 'Envy, hatred, and jealousy dogged the steps of every other officer in the fleet; but of him, both then and afterwards, every man spoke well.' The 'tremendous powers' intrusted to him by the Council of State, he exercised with off-handed and masterly success—startling politicians and officials of the *ancien régime* by his bold and open tactics, and his contempt for tortuous bypaths in diplomacy. His wondrous exploits were performed with extreme poverty of means. He was the first to repudiate and disprove the supposed fundamental maxim in marine warfare, that no ship could attack a castle, or other strong fortification, with any hope of success. The early part of his naval career was occupied in opposing and defeating the piratical performances of Prince Rupert, which then constituted the support of the exiled Stuarts, and which Mr Dixon refuses to interpret in such mild colours as Warburton and others. Blake's utmost vigilance and activity were required to put down this extraordinary system of freebooting; and by the time that he had successively overcome Rupert, and the minor but stubborn adventurers, Grenville and Carteret, he was in request to conduct the formidable war with Holland, and to cope with such veterans as Tromp, De Witt, De Ruyter, &c. Of the various encounters in which he thus signalled himself, his biographer gives most spirited descriptions, such as their length alone deters us from quoting. On one occasion only did Blake suffer a defeat; and this one is easily explained by—first, Tromp's overwhelming superiority of force; secondly, the extreme deficiency of men in the English fleet; and thirdly, the cowardice or disaffection of several of Blake's captains at a critical moment in the battle. Notwithstanding this disaster, not a whisper was heard against the admiral either in the Council of State or in the city; his offer to resign was flatteringly rejected; and he soon found, that the 'misfortune which might have ruined another man, had given him strength and influence in the country.' This disaster, in fact, gave him power to effect reforms in the service, and to root out abuses which had defied all his efforts in the day of his success. He followed it up by the great battle of Portland, and other triumphant engagements.

Then came his sweeping *tours de force* in the Mediterranean; in six months he established himself, as Mr Dixon says, as a power in that great midland sea, from which his countrymen had been politically excluded since the age of the Crusades—teaching nations, to which England's very name was a strange sound, to respect its honours and its rights; chastising the pirates of Barbary with unprecedented severity; making Italy's petty princes feel the power of the

northern Protestants; causing the pope himself to tremble on his seven hills; and startling the council-chambers of Venice and Constantinople with the distant echoes of our guns. And be it remembered, that England had then no Malta, Corfu, and Gibraltar as the bases of naval operations in the Mediterranean: on the contrary, Blake found that in almost every gulf and island of that sea—in Malta, Venice, Genoa, Leghorn, Algiers, Tunis, and Marseilles—there existed a rival and an enemy; nor were there more than three or four harbours in which he could obtain even bread for love or money.

After this memorable cruise, he had to conduct the Spanish war—a business quite to his mind; for though his highest renown had been gained in his conflicts with the Dutch, he had secretly disliked such encounters between two Protestant states; whereas, in the case of Popish Spain, his soul leaped at the anticipation of battle—sympathising as he did with the Puritan conviction, that Spain was the devil's stronghold in Europe. At this period, Blake was suffering from illness, and was sadly crippled in his naval equipments, having to complain constantly of the neglect at home to remedy the exigencies of the service. 'Our ships,' he writes, 'extremely foul, winter drawing on, our victuals expiring, all stores failing, our men falling sick through the badness of drink, and eating their victuals boiled in salt water for two months' space' (1655.) His own constitution was thoroughly undermined. For nearly a year, remarks his biographer, 'he had never quitted the "foul and defective" flag-ship. Want of exercise and sweet food, beer, wine, water, bread, and vegetables, had helped to develop scurvy and dropsy; and his sufferings from these diseases were now acute and continuous.' But his services were indispensable, and Blake was not the man to shrink from dying in harness. His sun set gloriously at Santa Cruz—that miraculous and unparalleled action, as Clarendon calls it, which excited such grateful enthusiasm at home. At home! words of fascination to the maimed and enfeebled veteran,* who now turned his thoughts so anxiously towards the green hills of his native land. Cromwell's letter of thanks, the plaudits of parliament, and the jewelled ring sent to him by his loving countrymen, reached him while homeward bound. But he was not again to tread the shores he had defended so well.

As the ships rolled through the Bay of Biscay, his sickness increased, and affectionate adherents saw with dismay that he was drawing near to the gates of the grave. 'Some gleams of the old spirit broke forth as they approached the latitude of England. He inquired often and anxiously if the white cliffs were yet in sight. He longed to behold once more the swelling downs, the free cities, the goodly churches of his native land. . . . At last, the Lizard was announced. Shortly afterwards, the bold cliffs and bare hills of Cornwall loomed out grandly in the distance. But it was too late for the dying hero. He had sent for the captains and other great officers of his fleet, to bid them farewell; and while they were yet in his cabin, the undulating hills of Devonshire, glowing with the tints of early autumn, came full in view. . . . But the eyes which had so yearned to behold this scene once more were at that very instant closing in death. Foremost of the victorious squadron, the *St George*, rode with its precious burden into the Sound; and just as it came into full view of the eager thousands crowding the beach, the pier-heads, the walls of the citadel, &c. ready to catch the first glimpse of the hero of Santa Cruz, and salute him with a true English welcome—he, in his silent cabin, in the midst of his lion-hearted comrades, now sobbing like little children, yielded up his soul to God.'

* He had been lamed for life, by a wound in the thigh, at the battle of Portland, 1653.

The corpse was embalmed, and conveyed to Greenwich, where it lay in state for some days. On the 4th of September 1657, the Thames bore a solemn funeral procession, which moved slowly, amid salvoes of artillery, to Westminster, where a new vault had been prepared in the noble abbey. The tears of a nation made it hallowed ground. A prince, of whom the epigram declares that, if he never said a foolish thing, he never did a wise one—saw fit to disturb the hero's grave, drag out the embalmed body, and cast it into a pit in the abbey-yard. One of Charles Stuart's most witless performances! For Blake is not to be confounded—though the Merry Monarch thought otherwise—with the Iretons and Bradshaws who were similarly exhumed. The admiral was a moderate in the closest, a patriot in the widest sense.

In the chivalric disposition of the man, there was true affinity to the best qualities of the Cavalier, mingled sometimes with a certain grim humour, all his own. Many are the illustrations we might adduce of this high-minded and generous temperament. For instance: meeting a French frigate of forty guns in the Straits, and signaling for the captain to come on board his flag-ship, the latter, considering the visit one of friendship and ceremony, there being no declared war between the two nations—though the French conduct at Toulon had determined England on measures of retaliation—readily complied with Blake's summons; but was astounded, on entering the admiral's cabin, at being told he was a prisoner, and requested to give up his sword. No! was the surprised but resolute Frenchman's reply. Blake felt that an advantage had been gained by a misconception, and scorning to make a brave officer its victim, he told his guest he might go back to his ship, if he wished, and fight it out as long as he was able. The captain, we are told, thanked him for his handsome offer, and retired. After two hours' hard fighting, he struck his flag; like a true French knight, he made a low bow, kissed his sword affectionately, and delivered it to his conqueror. Again: when Blake captured the Dutch herring-fleet off Bochness, consisting of 600 boats, instead of destroying or appropriating them, he merely took a tithe of the whole freight, in merciful consideration towards the poor families whose entire capital and means of life it constituted. This 'characteristic act of clemency' was censured by many as Quixotic, and worse. But, as Mr Dixon happily says: 'Blake took no trouble to justify his noble instincts against such critics. His was indeed a happy fate: the only fault ever advanced by friend or foe against his public life, was an excess of generosity towards his vanquished enemies!' His sense of the comic is amusingly evidenced by the story of his *ruse* during a dearth in the same siege. Tradition reports, that only one animal, a hog, was left alive in the town, and that more than half starved. In the afternoon, Blake, feeling that in their depression a laugh would do the defenders as much good as a dinner, had the hog carried to all the posts and whipped, so that its screams, heard in many places, might make the enemy suppose that fresh supplies had somehow been obtained. According to his biographer, never man had finer sense of sarcasm, or used that weapon with greater effect—loving to find expression for its scorn and merriment in the satires of Horace and Juvenal; and thus in some degree relieving the stern fervour of Puritan piety with the more easy graces of ancient scholarship.

The moral aspects of his character appear in this memoir in an admirable light. If he did not stand so high as some others in public notoriety, it was mainly because, to stand higher than he did, he must plant his feet on a bad eminence. His patriotism was as pure as Cromwell's was selfish. Mr Dixon alludes to the strong points of contrast, as well as of resemblance, between the two men. Both, he says, were sincerely religious, undauntedly brave, fertile in expedients, irresistible in

action. Born in the same year, they began and almost closed their lives at the same time. Both were country gentlemen of moderate fortune; both were of middle age when the revolution came. Without previous knowledge or professional training, both attained to the highest honours of the respective services. But there the parallel ends. Anxious only for the glory and interest of his country, Blake took little or no care of his personal aggrandisement. His contempt for money, his impatience with the mere vanities of power, were supreme. Bribery he abhorred in all its shapes. He was frank and open to a fault; his heart was ever in his hand, and his mind ever on his lips. His honesty, modesty, generosity, sincerity, and magnanimity, were unimpeached. Cromwell's inferior moral qualities made him distrust the great seaman; yet now and then, as in the case of the street tumult at Malaga, he was fain to express his admiration of Robert Blake. The latter was wholly unversed in the science of nepotism, and 'happy family' compacts; for although desirous of aiding his relatives, he was jealous of the least offence on their part, and never overlooked it. Several instances of this disposition are on record. When his brother Samuel, in rash zeal for the Commonwealth, ventured to exceed his duty, and was killed in a fray which ensued, Blake was terribly shocked, but only said: 'Sam had no business there.' Afterwards, however, he shut himself up in his room, and bewailed his loss in the words of Scripture: 'Died Abner as a fool dieth!' His brother Benjamin, again, to whom he was strongly attached, falling under suspicion of neglect of duty, was instantly broken, and sent on shore. 'This rigid measure of justice against his own flesh and blood, silenced every complaint, and the service gained immeasurably in spirit, discipline, and confidence.' Yet more touching was the great admiral's inexorable treatment of his favourite brother Humphrey, who, in a moment of extreme agitation, had failed in his duty. The captains went to Blake in a body, and argued that Humphrey's fault was a neglect rather than a breach of orders, and suggested his being sent away to England till it was forgotten. But Blake was outwardly unmoved, though inwardly his bowels did yearn over his brother, and sternly said: 'If none of you will accuse him, I must be his accuser.' Humphrey was dismissed from the service. It is affecting to know how painfully Blake missed his familiar presence during his sick and lonely passage homewards, when the hand of death was upon that noble heart. To Humphrey he bequeathed the greater part of his property.

In the rare intervals of private life which he enjoyed on shore, Blake also compels our sincere regard. When released for awhile from political and professional duties, he loved to run down to Bridgewater for a few days or weeks, and, as his biographer says, with his chosen books, and one or two devout and abstemious friends, to indulge in all the luxuries of seclusion. 'He was by nature self-absorbed and taciturn. His morning was usually occupied with a long walk, during which he appeared to his simple neighbours to be lost in profound thought, as if working out in his own mind the details of one of his great battles, or busy with some abstruse point of Puritan theology. If accompanied by one of his brothers, or by some other intimate friend, he was still for the most part silent. Always good-humoured, and enjoying sarcasm when of a grave, high class, he yet never talked from the loquacious instinct, or encouraged others so to employ their time and talents in his presence. Even his lively and rattling brother Humphrey, his almost constant companion when on shore, caught, from long habit, the great man's contemplative and self-communing gait and manner; and when his friends rallied him on the subject in after-years, he used to say, that he had caught the trick of silence while walking by the admiral's side

in his long morning musings on Knoll Hill. A plain dinner satisfied his wants. Religious conversation, reading, and the details of business, generally filled up the evening until supper-time; after family prayers—always pronounced by the general himself—he would invariably call for his cup of sack and a dry crust of bread, and while he drank two or three horns of Canary, would smile and chat in his own dry manner with his friends and domestics, asking minute questions about their neighbours and acquaintance; or when scholars or clergymen shared his simple repast, affecting a droll anxiety—rich and pleasant in the conqueror of Tromp—to prove, by the aptness and abundance of his quotations, that, in becoming an admiral, he had not forfeited his claim to be considered a good classic.'

The care and interest with which he looked to the well-being of his humblest followers, made him eminently popular in the fleet. He was always ready to hear complaints and to rectify grievances. When wounded at the battle of Portland, and exhorted to go on shore for repose and proper medical treatment, he refused to seek for himself the relief which he had put in the way of his meanest comrade. Even at the early period of his cruise against the Cavalier corsairs of Kinsale, such was Blake's popularity, that numbers of men were continually joining him from the enemy's fleet, although he offered them less pay, and none of that licence which they had enjoyed under Prince Rupert's flag. They gloried in following a leader *sans peur et sans reproche*—one with whose renown the whole country speedily rang—the renown of a man who had revived the traditional glories of the English navy, and proved that its meteor flag could 'yet terrific burn.'

SUMMER LODGINGS.

In the dominions of the Czar, the backs of the serfs suffer a weekly titillation as insufferable, although not so deadly, as the less frequent knout. When it comes to Wednesday, they begin to imagine that they are not exactly comfortable; on Thursday, the natural moisture of their skin seems fast drying up, and they are in an incipient fit of the fidgets; on Friday, the epidermis cracks all over, or makes-believe to do so; and on Saturday, the whole population, with a shout of impatient joy, rush to the bath-house of the village, like a herd of bullocks in the dog-days to the river, and boil themselves in steam. When thoroughly done, they come out, beautifully plumped, as the cooks say, and feeling fresh and vigorous, and as fit as ever they were in their lives to encounter a new week of serfdom.

An annual process analogous to this takes place in our own country. In spring, we begin to look wistfully at the garden, to watch the opening of the lettuces, and count the colours of the pansies. As the season advances, we wander into the fields, examine curiously the thin grass, and turn an admiring eye towards the green hills in the distance. As May breaks upon us in sunlight, though the east wind is still chill, we half persuade ourselves that this really is the season of love and sentiment; and when the month ripens into June, when the grass beneath our feet actually deserves the name of a carpet, when the trees are rich and umbrageous, when the birds are in full song, and the roses in full blow—then the hitherto indefinite longing of our heart acquires strength and purpose. The dry streets look unnatural; the formal lines of houses offend the taste; the air is close and hot; the younger children look pale, and their elder sisters languish. The month is at length out, and we wonder how we have survived it. The thing can no longer be borne; the town looks and breathes like a pest-house; while

hill-sides glimmer in our waking dreams, broad seas stretch away till they are lost in the golden light—

'And dying winds and waters near
Make music to the lonely ear:'

still worse—everybody that is anybody is off to the country and the sea, and we rush madly after.

But the country? Where is the country? That is the puzzle. In our youth, we knew many a quiet village, many a fine beach, many a sheltered bay, where one might wander, or swim, or muse, or rusticate in any way he chose. The village has grown into a town; the beach is lined with villas; the bay swarms with vessels, and its shores with population. Every eligible spot on the coast becomes the resort of country-goers, till it is no longer the country. All local advantages are taken advantage of, till they disappear. The citizen, charmed with the countryness of the spot, builds his box by the water-side; the speculator runs up lines of houses; a handsome inn rises in the midst; and benevolent individuals hasten to the new centre of attraction, loaded with every kind of commodity men stand in need of, and are likely to buy. Here, in Scotland, on the Clyde, which is the grand sanatorium of the east as well as the west country, this process of change is remarkable. The once wildly beautiful shores, wherever there is not a town or a village, are dotted with trim white villas, glimmering here and there among the trees. The angles of the lochs, where these diverge from the parent stream, are covered with houses. The Gair Loch, which we remember as one of the sweetest mysteries of a mountain lake whose banks ever echoed to the songs of poetry and love, is a snug suburban retreat. The entrance of the Holy Loch, and of the dark and awful Loch Long, are fortified against the spirit of nature by groups of streets. At the heretofore quiet village of Dunoon, slumbering at the foot of its almost obliterated castle, you might lose yourself in the wilderness of new habitations. Gourrock, on the opposite side, where in our boyhood the fairies disported round the Kempuck Stane, is a bustling town, with a suburb stretching along the Clyde, nearly as long as the long town of Kirkcaldy, on the Forth; and at Largs, the barrows of the ancient Danes have become the cellars of the sons of little men, who confine spirits in them, as the prophet Solomon used to do, with a sealed cork. The once solitary island of Cumbrae is the town of Milport; the hoary ruins of Rothesay Castle are almost buried in a congeries of seaport streets and lanes; and, smoking, sputtering, and flapping their water-wings, scores of steamers ply in endless succession among these and a multitude of other places of renown.

All this, we may be told, is as it should be; a house is better than a hut, and the conveniences of civilised life better than roughing it in the desert: but we will not be comforted. Roughing it! that is just what the smoke-dried citizen wants occasionally, to prevent his blood from stagnating, and keep his faculties in working order. Physically, at least, we are not half the men we were when we used to rumble, and sometimes tumble, in stage-coaches, exposed to all the excitement and adventures of a journey; or to get as sick as forty dogs, tossing about whole days and nights in a sailing vessel. Then, when we landed, how delightful were the miseries of a cottage; the makeshifts, the squeezing, the dirt, the hunger—that real-pie was *always* left behind!—the hunting of the neighbourhood for eggs for the children, the compulsory abstinence for three days out of four from butcher-meat, and the helpless dependence upon the chapter of accidents for everything else!

Now, we get into a railway carriage, or the cabin of a steamer, and after taking a book or a nap for an hour or two, raise our heads, and find ourselves,

somehow or other, fifty miles off—in the country. The country is a genteel house in a genteel street, or a nice villa in a row of nice villas, where we are surrounded with all the conveniences we enjoy at home. The very society is the same; for our friends Thomson and Smith, and the whole of that set, have brought their families to the same place for summer lodgings—it is so agreeable to be among one's acquaintances. Then we begin to enjoy ourselves: we have conversation-parties, and dancing-parties, and balls, all the same as at home. We enjoy our newspaper, as usual, in our comfortable reading-room. In the morning, we take a stroll or a dip, or drink water at the Wells, which, although undoubtedly nasty, is undeniably wholesome. Then there is a steamer in sight, and we all hasten to the pier, to ascertain if we know anybody on board. Then we dine early, for one *must* dine early in the country. Then we take a nap; then another stroll; then there is another steamer to watch; then we drink tea; then to the pier again. This time, the vessel's head is pointed homewards; and as she breaks away from the land, we follow her with our eyes till she is swallowed up in the distance. Then we turn away with a sigh; go back to our lodgings; lounge into bed; and fall asleep in the midst of the delightful sensation of having nothing to do, and being in the country.

All this is delightful, no doubt; every bit as good as being at home. Our aim, in fact, is to carry home with us—to feel as if we had never left No. 24. The closer the resemblance between our country lodgings and our town-house, the better we are off; for we then get what we have come for—change of air—without any sacrifice of comfort.

But we doubt whether 'change of air' has so limited a meaning. Hygienically speaking, it includes, we suspect, change of habits, change of diet, change of company, change of thought. The miseries of the old country lodgings were better for the health than the comforts of the new. The very grumbling they gave rise to was a wholesome exercise. The short allowance was worth a whole pharmacopœia. The ravenous appetite that fastened upon things common and unclean was a glorious symptom. We came back strengthened in mind as well as body. Our country sojourn had the effect of foreign travel in opening the heart and expanding the intellect; it smoothed away prejudices and upset conventionalities; and the ruddy glow of our sunburnt cheeks was the external token of the healthy natural tone of the feelings within. No; this passion for comfort and gentility in the wilderness, is a bad sign of the generation: it bespeaks effeminacy of character, and a vanity which, however graceful it may be thought in the town, shews mean and ridiculous among the hills, and woods, and waters of the country.

Among our neighbours on the continent, the summer move is not so universal as with us. In Paris, for instance, everything is considered the country that is outside the barriers; and in the fine season, every bourgeois family is outside the barriers at least once a week—eating, drinking, dancing, and singing. Then there are the walks in the Bois de Boulogne, and the picnics at St Cloud, and the excursions to Versailles: wherever there is green turf and shady trees, you hear the sounds of mirth and music rising in the clearest, brightest atmosphere in the world. Thus a sojourn out of town is not a necessity. They take change of air by instalments, and pass the summer in a state of chronic excitement.

In other parts of the world, the move is as entire as with us; and in at least one instance, all classes of the population desert the cities at the same time, and flock to the same sea-side. To be sure, this sea-side is somewhat extensive, and there need be no more crowding than is social and comfortable. An amusing account of the migration, and of the summer lodgings of Central America is given in Mr Squier's *Nicaragua*, recently

published. The state of Nicaragua occupies that part of the Isthmus lying between the lake of the same name and the Pacific, the distance between being in some places only about fifteen miles. In this narrow tract there are several large towns, such as Grenada and Leon, which, in spite of the breath of the two oceans, get smoke-dried by the time the dry season advances into March. Then comes on the 'Paseo al mar,' or bathing-season, when a great portion of the population, taken not merely from the upper classes, but from the bourgeoisie and Indian peasantry, rush down to the shores of the Pacific. 'At that time,' says Mr Squier, 'a general movement of carts and servants takes place in the direction of the sea, and the government despatches an officer and a guard, to superintend the pitching of the annual camp upon the beach, or rather upon the forest-covered sand-ridge which fringes the shore. Each family builds a temporary cane-hut, lightly thatched with palm-leaves, and floored with petates or mats. The whole is wickered together with vines, or woven together basketwise, and partitioned in the same way, by means of coloured curtains of cotton cloth. This constitutes the *penetrals*, and is sacred to the *bello sexo* and the babies. The more luxurious ladies bring down their neatly-curtained beds, and make no mean show of elegance in the interior arrangements of their impromptu dwellings. Outside, and something after the fashion of their permanent residences, is a kind of broad and open shed, which bears a very distant relation to the corridor. Here hammocks are swung, the families dine, the ladies receive visitors, and the men sleep. . . . The establishments here described pertain only to the wealthier visitors, the representatives of the upper classes. There is every intermediate variety, down to those of the *mozo* and his wife, who spread their blankets at the foot of a tree, and weave a little bower of branches above them—an affair of ten or a dozen minutes. And there are yet others who disdain even this exertion, and nestle in the dry sand.'

This kind of gipsying expedition to the sea in summer would hardly suit the form of European, or at least British civilisation; but we do not see why, in the one continent more than in the other, one's country lodgings should be required to resemble a town-house. In the Clyde, which we have mentioned as a resort for summer loiterers, there is one exceptional place—the island of Arran. Here the Marquis of Douglas has determined, with much good taste, that his property shall not be vulgarised by the new style of country lodgings, and so far from feuing the ground, he will not permit even a pier to be built for the accommodation of visitors. The village, accordingly, is simply a line of thatched cottages, which, in the fine season, are filled to overflowing. A few houses of more pretension stand on the other side of the bay; but, in general, no one sets his foot in Brodick who has not made up his mind to rough it pretty much in the fashion of the last generation. Sometimes, on the occasion of a holiday in Glasgow, which is six hours' steaming distant, the village is flooded with a moving population that can neither find house-room on the island nor means of quitting it the same day. Then comes a scene of something more than Mexican roughness. Shawls, cloaks, plaids, are the only substitute for tents, and a bush or a tree the only shelter from the summer wind. Such wandering companies are rarely short of provisions, for they have a wholesome dread of Highland hunger; and hearty is the feast and loud the merriment, as they sit thus, houseless and homeless outcasts of the Clyde. The night comes on, neither dark nor unpleasantly cold, and the trooping stars assemble in the heavens, and look down on the slumberous waters, as bright and new as they were seen of old from the hill-tops of Chaldea. Higher swell the hearts of the spectators for a time, till, yielding to the

influence of the hour, lower and lower sink their pulses of emotion, like the tide of the lately panting deep. Their voices fall; their words are few and whispered, then heard no more; the lights of the village disappear one by one; the last door is heard to shut; there is silence on the earth.

We never heard of anybody being the worse of this adventure, although it is a kind of roughing we would not positively recommend to Miss Laura Matilda, or any of her fair sisters. We would give them a thatched roof over their heads, a weather-tight room for their slumbers, and a substantial wall between them and the couple of cows that yield their warm milk in the morning. We would afford them a homely sitting-room, with no temptation to keep them within doors for a single moment, except during their brief and humble meals. We would plant their tabernacle in some lonely place on a hillside, or on the shores of a romantic loch, an hour's smart walk from any society they are accustomed to at home. We would have them make acquaintances of the said two cows; of both the dogs, even the surly one, which cannot for some time understand who or what they are, or what business they have there; of the hens, that present them with newly-laid eggs to breakfast; of the five or six sheep, to whom they are evidently objects of curiosity and admiration; of that sociable goat, which accompanies the sheep to the hill like one of themselves; and more especially of the little boy, who is proud of being called the herd; and of the cotter and his old mother, and his wife and two young daughters. We would insist upon their feeling a kindly interest in these new friends, one and all; on their taking leave of them individually when coming away; and on their carrying home with them an impression which would sometimes, in the crowded street, or the hot room, well suddenly up in their hearts like a fresh stream, or pass across their cheeks like a breath of mountain air.

Depend upon it, we lose much humanising feeling, much true refinement, much of the poetry of life, in parting with the roughness of our Summer Lodgings.

PAPER-MONEY AND BANKING IN CHINA.

THE origin or prototype of so many of our European arts and customs has been found in the 'central flowery land,' that it is not surprising to hear of the Chinese having begun to use paper-money as currency in the second century preceding the Christian era. At that time, the coinage of the Celestials was of a more bulky and ponderous nature than it is at the present day; and we may easily believe that a people so cunning and ingenious, would contrive not a few schemes to avoid the burden of carrying it about; as the man did, who scratched the figure of an ox on a piece of leather, and went from door to door with that until he had found a customer, leaving the animal, meantime, at home in the stall. There was a deficiency, too, in the ways and means of the government: money was never plentiful enough in the imperial coffers. At last, to get out of the difficulty, it was determined to try the effect of a paper-currency, and an issue was made of assignats or treasury-warrants, which, being based on the credit of the highest authorities, were regarded as secure; which fact, with their facility of transfer, soon brought them into circulation. Of course, a good deal of legislation was expended on the measure, before it could be got to work satisfactorily, and it underwent many fluctuations in its progress towards permanence. The intestine wars to which China was exposed at that period, by overturning dynasty after dynasty, led one government to disavow the obligations of its predecessor, and the natural consequences of bad faith followed. After circulating with more or less success for five hundred years, the government paper-money disappeared.

This happened under the Ming dynasty: the Manchus,

who succeeded, gave themselves no trouble to restore the paper-currency; on which the trading portion of the community took the matter into their own hands, and by the time that their Tatar conquerors were quietly settled in their usurped authority, the merchants had revived the use of paper. They were too sensible of its great utility not to make the attempt; and since that time, they have gone on without any aid from the state, developing their plans as experience suggested, and so cautiously as to insure success. This result is, however, far below what has been obtained by Europeans. In comparison with ours, the banking-system of China is in a very primitive condition; theirs is extremely limited in its application, each city restricting itself to its own method; and while the means of inter-communication are imperfect, there is little prospect of improvement.

One example may be taken as an illustration of the whole; and we avail ourselves of a communication made by Mr Parkes to the Royal Asiatic Society on the paper-currency of Fuhchowfoo, for the substance of the present article. As in other places, the system was started in the city of Fuhchow by private individuals, who began by circulating among each other notes payable on demand. As the convenience of such a medium became apparent, the circulation was extended, and ultimately offices were opened for the special purpose of issuing notes; but as the only guarantee for their security was the character of those who put them forth, the circulation remained comparatively trifling, until their credit was recognised and established. Not till the first quarter of the present century did the use of paper become extensive or permanent; and now, everybody in Fuhchowfoo prefers notes to coin.

As no licence is required, any one may commence the banking business, and at first considerable mischief resulted from this liberty. Speculators who forced their notes largely into circulation, not unfrequently met with a reverse, with the usual consequences of distress and embarrassment to their connection. Although this for a time brought paper into disfavour, it has now recovered, and the great competition is found to have the effect of mitigating the evils of failure. Where so many are concerned, individual suffering must be comparatively slight. The banks, moreover, are not banks of deposit; the proprietors prefer not to receive deposits, so that private parties run no risk of a great and sudden loss, beyond that of such notes as they may hold at the time of a stoppage. On the other hand, the usefulness of a bank is limited by this arrangement; there can be no paying of cheques; but very few of the banking establishments can transact business beyond the city or the department in which they may be located, and seldom or never beyond the limits of the province. Hence the convenience and safety of making payments at places remote from each other, through the medium of a banker, is almost unknown in China.

Within certain limits, the large bankers undertake mercantile exchanges; they also refine the sycee, or silver, for the receivers of taxes. The government will take no silver under a standard quality; the collector delivers his sycee to the banker, who weighs, refines, and casts it into ingots, for a consideration, giving a receipt, which is handed to the treasurer of the department, who calls for the amount when required.

The small banks transact their business on an extremely petty scale. On first starting in business, their notes are seldom in circulation above a few hours, and they have always to be watchful to avoid a 'run.' It is among this class that failures most frequently occur, the time of the crash being the end of the year, owing to the demand for specie which then arises. As a precautionary measure, some of them mostly circulate the notes of the large banks, which do not return to them as their own would. Their own are sure to come back once at least in the twenty-four hours, as the

large banks make a rule of sending all petty bank-notes to their issuers every day, and exchanging them for specie or larger notes. The petty establishments resort to various expedients for the sake of profit; one is, to locate themselves in a good situation: if far from a large bank, they charge a higher rate of discount on notes presented for payment, than is charged by their more powerful competitor; and the people who live in the neighbourhood submit to this charge, rather than take the trouble of going to the large bank. On the contrary, if the great and the small are near together, the latter charge lower, and make their profit by placing base coin among the strings of copper cash which they pay to their customers in exchange for notes. The inferior cash is manufactured for the purpose, in the same way as Birmingham halfpence used to be for distribution by the keepers of toll-gates.

'Such petty chicanery is not viewed, as with us, in the light of an offence, since, from the exceeding low value of the Chinese cash—twenty-seven being only equivalent to a penny—those must be bad indeed which will not pass current with the rest; and, accordingly, the inferior sorts, when used in moderation, are accepted along with the better in all the ordinary transactions of life. The profits of these establishments must, therefore, be but slender—proportioned, however, to the extent of their dealings; and some of the smallest firms may not make more than half a dollar in the course of a day.'

'The banking establishments in the city and suburbs of Fuhchow,' says Mr Parkes, 'may be enumerated by hundreds. Most of them are naturally very insignificant, and the circulation of their notes exceedingly limited. Many of the outside notes will not pass current inside; and are only convertible at the place of issue. Such branches as these must be entirely superfluous, and might seriously inconvenience or trammel the transactions of the higher ones; but, in order to guard against encroachment from this direction, and as a self-protective measure, several of the leading banks of known stability co-operate with each other to keep up the value of their notes; and thus, by holding a strong check on the issues of those minor parties, effectually continue to regulate the whole system. There are thirty of these establishments inside and outside the city, all reported to be possessed of capital to the amount of from 500,000 to upwards of 1,000,000 dollars.'

'These latter establishments command the utmost confidence, and their notes pass current everywhere and with everybody. They contribute mutual support by constantly exchanging and continually cashing each other's notes, which they severally seem to value as highly as their own particular issues. This reciprocal and implicit trust must add greatly to their solidity, and tend to prevent the possibility of failure. The chief banker gained his high reputation by a voluntary subscription, about thirty years ago, of no less than 100,000 dollars to the government toward the repairs of the city walls and other public works, for which he was rewarded with honorary official insignia, and the extensive patronage or business of all the authorities. These large banks are complete rulers of the money-market; they regulate the rates of exchange, which are incessantly fluctuating, and are known to alter several times in the course of the day. The arrival or withdrawal from the place of specie to the amount of a few thousands, has an immediate effect in either raising or lowering the exchange. The bankers are kept most accurately informed on the subject by some twenty men in their general employ, whose sole business it is to be in constant attendance in the market, and to acquaint the banks with everything that is going on, when they, guided by the transactions of the day, determine and fix upon, between themselves, the various prices of notes, sycee, and dollars. Their unanimity on

these points is very remarkable; and they are all deeply impressed with the salutary conviction, that their chief strength consists in the degree of mutual harmony that they preserve, and the confidence they place in one another. These reporters are also very useful to new arrivals, in affording them guidance on matters of exchange, or in introducing them to the best bankers; and the allowances that the stranger makes to them for their assistance, and the banker for procuring him custom, constitute the gains of their calling. They have also to report the prices of silver every morning at the Magistracy, which, from its daily increasing value, has become an object of especial attention.' Twenty years ago, much discontent was expressed that silver, which had been worth 1000 cash per ounce, rose to 1500; now it is over 2000, owing to the continuous drain of the metal from the country.

Still, with all this, failures are rare. The petty banks are most liable to this reverse; and on such occasions, they generally contrive to arrange the matter quietly among themselves; but the whole property or lands belonging to the defaulters may be seized and sold to satisfy the claims of the creditors: the dividend is usually from 10s. to 12s. in the pound. Wilful fraud is seldom practised; the heaviest instance known, was for 70,000 dollars; from the year 1843 to 1848, there were but four bankruptcies, and three of these were for less than 6000 dollars. The defaulters frequently escape punishment owing to the high cost of prosecution. The large banks are safe; but at times, from false or malicious reports, are exposed to a sudden 'run;' a great crowd besets the doors when least expected, and numbers of vagabonds seize the opportunity for mischief and plunder. These outbreaks grew to such a pitch, that the magistrates now, whenever possible, hasten to the threatened establishment, to repress violence by their presence and authority. The rush, however, is so sudden, that before they can arrive on the spot, the mob has improved its opportunity for destruction, and disappeared.

Forgery is not often attempted, probably because it does not pay, owing to the fact of its being extremely difficult to circulate any but notes of small value. The penalty for this offence is transportation to a distance of three thousand *le*—about a thousand miles; or imprisonment or flogging, according to circumstances. We question if such an instance as the following ever occurred out of China:—'A forger of some notoriety having been several times prosecuted by the bankers, and with but little success, for he still continued to carry on his malpractices, they conferred together, and agreed to take him into their pay, making him responsible for any future frauds of the kind. He continues to receive a stipend from them at the present time, and is one of their most effective safeguards against further imposition, as it devolves upon him to detect and apprehend any other offender.'

Most of the bank-notes are printed from copper-plates, but some of the petty dealers still use wooden blocks. They are longer and narrower than ours, and have a handsomely engraved border, within which are paragraphs laudatory of the ability or reputation of the firm. The notes are of three kinds: for cash, dollars, and sycee. The first are from 400 cash (1s. 3d. sterling), to hundreds of thousands, and are largely circulated in all the smaller business transactions. The dollar-notes, varying from a unit to 500, and, in some instances, to 1000, circulate among the merchants, their value continually fluctuating with that of the price of the silver which they represent. The sycee-notes are from one to several hundred *taels* (ounces), and are chiefly confined to the government offices, to avoid the trouble and inconvenience of making payments in silver by weight. Whatever be the value or denomination of the notes, the holder is at liberty to demand payment of the whole whenever he pleases, and

receives it without abatement, as the banker makes his profit at the time of their issue. When notes are lost, payment is stopped, as here, and they are speedily traced, as it is the practice not to take notes of a high value—say, 100 dollars—without first inquiring at the bank as to their genuineness. But no indemnification is made for notes lost or destroyed by accident. Promissory-notes are the chief medium of interchange among merchants, who take ten days' grace on all bills, except those on which is written the word 'immediate.'

The rates of interest are, on lands and houses, from 10 to 15 per cent.; on government deposits, which the people are made to take at times against their will, 8 per cent.; on insurance of ships and cargoes, owing to the risk from storms and pirates, from 20 to 30 per cent.; on pawnbrokers' loans, 2 per cent. per month, or 20 per cent. per annum. Five days' grace is allowed on pledges; and if goods be not redeemed within three years, they are made over to the old clothes' shops at a settled premium of 20 per cent. on the amount lent on them. Pawnbrokers' establishments are numerous, and are frequented by all classes, who pawn without scruple anything they may possess. The banks, we are informed, 'keep up an intimate connection with the pawnbrokers, who make and receive all their payments in notes for copper cash, and will not take sycee, dollars, or dollar-notes—the former, lest they should prove counterfeit, and the latter, on account of the fluctuating value. They are very particular in passing the bank-notes, and will accept only those of the large banks. A notice is hung up in each shop, specifying what notes pass current with them; and when the people go to redeem the articles they have pledged, as they can present only those notes in payment, they have often to repair previously to the bank where they are issued, to purchase them, and, being at a premium, the banker thus gains his discount upon them. Of such importance is this considered, that, without the support of the pawnbrokers' connection, the business of a banker will always be limited. Indeed, many of the banks keep pawnbrokers' shops also; and the chief banker at Fuhchow is known to have opened no less than five of these establishments. This is on account of the high interest paid on pawnbrokers' loans.'

THINGS TALKED OF IN LONDON.

May, 1852.

As May of last year was made memorable by the opening of the Great Exhibition, so will the present month become famous for the pulling down of the Crystal Palace. Parliament has decreed it, and there is an end of the matter. If the people by and by find reason to complain of the proceeding, they will have no one to blame but themselves; because, had they spoken out as only a whole nation can speak, the decision of the legislature would have been on the other side of the question. We are promised, however, that it shall be re-erected on some other site, and herein must solace ourselves for disappointment at the removal, while waiting for the National Exhibition to be opened at Cork, or that of the Arts and Manufactures of the Indian Empire promised by the Society of Arts. Besides this, the present May will be noteworthy in the annals of ocean steam-navigation: the steamers to Australia are to commence their trips, as also those to Brazil and Valparaiso. Who would have dreamed, twenty years ago, that the redoubtable Cape Horn would, before a quarter century had expired, be rounded by a steamer from an English port? Captain Denham is about to sail in the *Herald*, to survey the islands of

the great ocean, one object being to find the best route and coaling-stations among the islands for steamers from the Isthmus to Sydney. The vessel will carry an interpreter, a supply of English seeds and plants, and a number of articles, to serve as presents for the natives. Should this survey be successful, and the United States' expedition to Japan produce the effect anticipated, the vast solitudes of the Pacific will be ere long continually echoing with the beat of paddle-wheels and the roar of steam. Rapid intercommunication will bring about changes, whereat politicians and ethnologists shall wonder. The Chinese still keep pouring into California by shiploads of 200 or 300 at a time, where they will perhaps learn that a year of Anglo-Saxondom is 'worth a cycle of Cathay.' We may regard as evidence of progress, that Loo-choo has been visited by Captain Shadwell of the *Sphinx*; he was received with great favour, and conducted to the royal city of Shooi, three miles inland. Readers of Captain Basil Hall's pleasant account of the same island will remember, that he was jealously forbidden to approach the interior. Do the Loo-choosans want to conciliate an ally? If, as is said, Japan is to become to the Americans what India is to us, we shall have them for neighbours in the east, as we now have them in the west. It will be an interesting event should England, America, and Russia some day meet on the Asiatic continent.

One good effect of railways, as you know, has been to cheapen coal, and excite activity in heretofore dormant mining districts—results which tell upon the trade in sea-borne coals. To meet this emergency, a scheme is on foot for sending coal from the Tyne to the Thames in steam-colliers, which, by their short and regular passages, shall compete successfully with the railways. The experiment is well worth trying, and ought to pay, if properly managed: meantime, our railways will extend their ramifications. Looking for a moment at what is doing in other parts of the world, it appears that there are at present 2000 miles of railway in France, besides as much more which is to be completed in four years. Portugal is only just beginning to think of iron routes: a few wakeful people are trying to impress that backward land with a sense of the advantages of rapid locomotion; and it is shewn that, by a simple system of railways, Lisbon would be placed at sixteen hours' distance from Madrid, forty-three from Paris, fifty-three from Brussels, and fifty-seven from London. Would it not be a comfort to be able to run away from the north-east monsoon, which has so long afflicted us, to the orange groves on the banks of the Tagus, in about two days and a half? A telegraph is about to be carried from the Austrian States over the Splügen into Switzerland—the Alps, it would appear, being no bar to the thought-flasher. There is a project, too, for a regular and universal dispatch of telegraph messages from all parts of the world. A mail and telegraph route from the Mississippi across to San Francisco is talked about. The proposer considers that post-houses might be erected at every twenty miles across the American continent, in which companies of twenty men of the United States' army might be stationed, to protect and facilitate the intercommunication; news would then find its way across in six or seven days. Should this scheme fail to be realised, the Americans may content themselves with having nearly 11,000 miles of railway already open, and another 11,000 in progress.

A beginning is made towards the abolition of the duty on foreign books imported. Government have consented that certain learned societies, and a number of scientific individuals, shall receive, duty free, such scientific publications as may be sent to them from abroad. Considering that the whole amount realised

by the present customs' charge is only L.8000, it is easy to believe that the authorities will shortly have to abolish it altogether. Another question in which books are concerned, is the dispute that has been going on for some time among the fraternity of booksellers, as to whether a retailer shall be allowed to sell books for any price he pleases, or not. Whether 'free-trade' or 'monopoly' is to prevail, will depend on the decision of the arbitrators who have been chosen. Leaving out all the rest of the kingdom, there are nearly 1000 booksellers in London; so the subject is an important one. This number affords a notable datum for comparison with other countries. In Germany, the number of booksellers is 2651, of which 2200 are retailers, 400 publishers only, while 451 combine the two. They are distributed—36 in Frankfort, 56 in Stuttgart, 52 in Vienna, 129 in Berlin, 145 in Leipsic. The figures are suggestive. Another fact may be instanced: in 1851 the number of visits to the British Museum for reading was 78,419—giving an average of 269 per day, the room having been open during 292 days. The number of books consulted was 424,851, or 1455 daily. This is an agreeable view of what one part of society is doing; but there is a reverse to the picture, as shewn in a recently published parliamentary report, from which it appears that in 1849 the juvenile offenders in England numbered 6849—in Wales, 73—of whom 167 were transported; in 1850, the numbers were respectively 6988, 82, 184, shewing an increase under each head. Of the whole number in confinement last November, 169 were under thirteen years of age, and 568 under sixteen: 205 had been in prison once before, 90 twice, 49 three times, 85 four times and upwards; 329 had lost one parent, 108 both parents; 327 could not read, and 554 had not been brought up to any settled employment. These facts may be taken as demonstrative of the necessity for multiplying reformatory agricultural schools, such as have been established in various parts of the continent with the happiest effects.

Among the prizes just announced by the French Académie, is one for 'the best work on the state of pauperism in France, and the means of remedying it,' to be adjudged in 1853. It is greatly to be wished that some gifted mind would arise capable of taking a proper survey of so grave a question, and bringing it to a practical and satisfactory solution. Some people are beginning to ask, whether it would not be better, with the proceeds of poor-rates, to send paupers to colonies which are scant of labourers, rather than to expend the money in keeping them at home. The Académie of Literature, too, has offered a prize for an essay on the parliamentary eloquence of England—a significant fact in a country where the legislature is not permitted to be eloquent, and where forty-nine provincial papers have died since the 2d of December. Coming again to science: the judicial *savants* have awarded a medal to Mr Hind for his discovery of some two or three of the minor planets—an acknowledgment of merit which will not fail of good results in more ways than one.

Various scientific matters, which are deserving of a passing notice, have come before the same learned body. Matteucci, who has been steadily pursuing his electro-chemical labours, now states that with certain liquids and a single metal he can form a pile, the electro-magnetic and electro-chemical effects of which are much greater than those obtained with the old piles of Volta and Wollaston, and come nearer to those of the batteries of Bunsen and Grove. As yet, he withholds the particulars, but they will shortly be forthcoming. M. Dureau de la Malle, in remarks on the breeding of fish, a subject which has of late occupied much attention in France, says, that he has now discovered the reason 'why domestic servants in Holland and Scotland, when taking a situation, stipulate that they

shall not be made to eat salmon more than three times a week; it is, the insipid taste of young salmon. It is safe to say, that however much M. de la Malle may know about fish, he knows but little of the habits of the countries to which he refers. M. Yvart mentions a fact that may be useful to graziers—the breed of cattle has been improved in France by the introduction of the Durham bull; but, as experience has shewn, it is at the expense of certain qualities deemed essential on the other side of the Channel. Here, we require meat as speedily as possible in young animals for consumption in our great towns; there, the great rural population use milk largely, and keep the animals longer before they are killed. The quantity of milk, it appears, is materially reduced in the Durham breed, and on this account M. Yvart suggests, that it should not be too much encouraged. Then there is something about dogs by Messrs Gruby and Delafond, who shew that the worms which have long been known to exist in the larger blood-vessels of certain dogs, are the parents of the almost innumerable *filaria* or microscopic worms, found circulating also in the veins. The number generally in one dog is estimated at 52,000, though at times it is more than 200,000; and being smaller than the blood-globules, the creatures penetrate the minutest blood-vessels. They are met with on the average in one dog in twenty-five, though most frequent in the adult and old, and without distinction of sex or race. The examination of the phenomenon is to be continued, with a view to ascertain whether dogs infested with these blood-worms are subject to any peculiar disease.

More interesting is the account of a successful case of transfusion of blood in the human subject, performed in presence of the ablest surgeons of Paris. A woman was taken to the Hôtel Dieu reduced by hemorrhage to the last stage of weakness, unable to speak, to open her eyes, or to draw back her tongue when put out. The basilic vein was opened, and the point of a syringe, warmed to the proper temperature, was introduced, charged with blood drawn from the same vein in the arm of one of the assistants. The quantity, 180 grammes, was injected in 2½ minutes, after which the wound was dressed, and the patient placed in a comfortable position. Gradually, the beatings of the pulse rose from 180 to 138, and became firmer; the action of the heart increased in energy; the eyes opened with a look of intelligence; and the tongue could be advanced and withdrawn with facility, and regained its redness. On the following day, there was a little delirium, after which the pulse fell to 90, the signs of vitality acquired strength, and at the end of a week the woman left the hospital restored to health. Cases of successful transfusion are so rare, that it is not surprising the one here recorded should have excited attention among our physiologists.

People inclined to corpulence may profit by M. Dancel's observations on the development of fat. He says, that some of his patients, whose obesity was a constant inconvenience and cause of disease, 'lost very notably of their *embonpoint* by a change in their alimentary regimen—abstaining almost entirely from vegetables, feculent substances, diminishing their quantity of drink, and increasing, when necessary, their portion of meat.' On another subject, M. Guérin Méneville believes he has found a new cochineal insect (*Coccus faba*) on the common bean, which grows wild in the south of France, and in such abundance, that a considerable quantity may be collected in a short time. The yield of colouring matter is of such amount, that a project is talked of for cultivating the plant extensively.

A communication has been made to the Geological Society at Paris by M. de Hauslab, on a subject which has from time to time occupied the thoughts of those who study the *physique* of the planet on which we live

—namely, the origin of the present state of our globe, and its crystal-like cleavage. After a few preliminary remarks about mountains, rocks, dikes and their line of direction, he shews that the globe presents the form approximately of a great octahedron (eight-sided figure); and further, that the three axial planes which such a form necessitates, may be described by existing circles round the earth: the first being Himalaya and Chimborazo; starting from Cape Finisterre, passing to India, Borneo, the eastern range of Australia, New Zealand, across to South America, Caracas, the Azores, and so round to Finisterre. The second runs in the opposite direction; includes the Andes, Rocky Mountains, crosses Behring's Strait to Siberia, thence to the Altai, Hindostan, Madagascar, Cape Colony, and ending again at the Andes of Brazil. The third, which cuts the two former at right angles, proceeds from the Alps, traverses the Mediterranean by Corsica and Sardinia to the mountains of Fezzan, through Central Africa to the Cape, on to Kerguelen's Land, Blue Mountains of Australia, Spitzbergen, Scandinavia, and completing itself in the Alps, from whence it started. These circles shew the limits of the faces of the huge crystal, and may be divided into others, comprising forty-eight in the whole. The views thus set forth exhibit much ingenuity; and when we consider that metals crystallise in various forms, and native iron in the octahedral, there is much to be said in their favour.

We shall probably not be long before hearing of another gold field, for Dr Barth writes from the interior of Africa, that grains of the precious metal have been found in two rivers which flow into Lake Tchad, and that the mountains in the neighbourhood abound with it. Should the first discovery be verified by further explorations, gold will be more abundant than it now promises to be, and Africa perhaps the richest source of supply. Apropos of this continent, a French traveller is about to prove from the results of a journey from the Cape towards the equator, that the Carthaginian discoveries had been pushed much further towards the south than is commonly supposed.

Agassiz, who, as you know, has become a citizen of the United States, has had the Cuvierian prize awarded to him for his great work on fossil fishes—an honour approved by every lover of science. This distinguished writer says, in his latest publications on fossil zoology, that the number of fossil fishes distributed over the globe is more than 25,000 species; of mammifera, over 8000; reptiles, over 4000; shells, more than 40,000; numbers which greatly exceed all former calculation. Of other American items, there is one worthy the notice of apiarians: some emigrants who sailed from Boston wished to convey a hive of bees to the Sandwich Islands, where the industrious insects have not as yet been introduced; all went well until the vessel reached the tropics, and there the heat was so great as to melt the wax of the combs, and consequently to destroy the bees.

Lieutenant Hunt, of the American Coast Survey, states that copper-plate engravings may be copied on stone; specimens are to appear in the forthcoming report. To quote his description: 'A copper-plate being duly engraved, it is inked, and an impression taken on transfer-paper. A good paper, which wetting does not expand, is needed, and a fatty coating is used in the process. The transfer-paper impression is laid on the smooth stone, and run through a press. It is then wetted, heated, and stripped off from the stone, leaving the ink and fat on its face. The heated fat is softly brushed away, leaving only the ink-lines. From this reversed impression on the stone, the printing is performed just as in ordinary lithography. A good transfer produces from 8000 to 5000 copies. Thus prints from a single copper-plate can be infinitely multiplied, the printing being, moreover, much cheaper than copper-plate.'

IN EXPECTATION OF DEATH.—CONSTANTIA.

WHEN I was young, my lover stole
One of my ringlets fair:
I wept—' Ah no! Those always part,
Who having once changed heart for heart,
Change also locks of hair.

'And wonder-opened eyes have seen
The spirits of the dead,
Gather like motes in silent bands
Round hair once reft by tender hands
From some now shrouded head.

'If—— Here he closed my quivering mouth,
And where the curl had lain,
Laid payment rich for what he stole:—
Could I to one hour crush life's whole,
I'd live that hour again!

My golden curls are silvering o'er—
Who heeds? The seas roll wide;
When one I know their bounds shall pass,
There'll be no tresses—save long grass—
For his hands to divide;

While I shall lie, low, deep, a-cold,
And never hear him tread:
Whether he weep, or sigh, or moan,
I shall be passive as a stone,
He living, and I—dead!

And then he will rise up and go,
With slow steps, looking back,
Still—going: leaving me to keep
My frozen and eternal sleep,
Beneath the earth so black.

Pale brow—oft leant against his brow:
Dear hand—where his lips lay;
Dim eyes, that knew not they were fair,
Till his praise made them half they were—
Must all these pass away?

Must nought of mine be left for him
Save the poor curl he stole?
Round which this wildly-loving me
Will float unseen continually,
A disembodied soul.

A soul! Glad thought—that lightning-like
Leaps from this cloud of doom:
If, living, all its load of clay
Keeps not my spirit from him away,
Thou canst not, cruel tomb!

The moment that these earth-chains burst,
Like an enfranchised dove,
O'er seas and lands to him I fly,
Whom only, whether I live or die,
I loved, love, and shall love.

I'll wreathe around him—he shall breathe
My life instead of air;
In glowing sunbeams o'er his head
My visionary hands I'll spread,
And kiss his forehead fair.

I'll stand, an angel bold and strong,
Between his soul and sin;
If Grief lie stone-like on his heart,
I'll beat its marble doors apart,
To let Peace enter in.

He never more shall part from me,
Nor I from him abide;
Let these poor limbs in earth find rest!
I'll live like Love within his breast,
Rejoicing that I died.

WATER.

Some four-fifths of the weight of the human body are nothing but water. The blood is just a solution of the body in a vast excess of water—as saliva, mucus, milk, gall, urine, sweat, and tears are the local and partial infusions effected by that liquid. All the soft solid parts of the frame may be considered as ever temporary precipitates or crystallisations (to use the word but loosely) from the blood, that mother-liquor of the whole body; always being precipitated or suffered to become solid, and always being redissolved, the forms remaining, but the matter never the same for more than a moment, so that the flesh is only a vanishing solid, as fluent as the blood itself. It has also to be observed, that every part of the body, melting again into the river of life continually as it does, is also kept perpetually drenched in blood by means of the blood-vessels, and more than nine-tenths of that wonderful current is pure water. Water plays as great a part, indeed, in the economy of that little world, the body of man, as it still more evidently does in the phenomenal life of the world at large. Three-fourths of the surface of the earth is ocean; the dry ground is dotted with lakes, its mountain-crests are covered with snow and ice, its surface is irrigated by rivers and streams, its edges are eaten by the sea; and aqueous vapour is unceasingly ascending from the ocean and inland surfaces through the yielding air, only to descend in portions and at intervals in dews and rains, hails and snows. Water is not only the basis of the juices of all the plants and animals in the world; it is the very blood of nature, as is well known to all the terrestrial sciences; and old Thales, the earliest of European speculators, pronounced it the mother-liquid of the universe. In the later systems of the Greeks, indeed, it was reduced to the inferior dignity of being only one of the four parental natures—fire, air, earth, and water; but water was the highest—*ὕδωρ μὲν ἀρίστη*—in rank.—*Westminster Review*.

LOTTERY OF DEATH.

The Polish and German peasantry have given the authorities at Posen considerable trouble by their inquiries respecting a 'Rothschild's Lottery.' They have been led to believe, that the 'great Rothschild' has been sentenced to be beheaded; but that he has been allowed to procure a substitute, if he can, by lottery! For this purpose, a sum of many millions is devoted, all the tickets to be prizes of 3000 thalers each, except one; that fatal number is a blank; and whoever draws it, is to be decapitated instead of the celebrated banker! Notwithstanding the risk, the applicants for shares have been numerous. [There is nothing surprising in the number of applications for these shares. Every man who enters the army in war-time, takes out a ticket in a similar lottery. In China, human life is of still less account; for there it is easy for a condemned criminal, whose escape the authorities are willing to connive at, to obtain a substitute, who, for a sum of money, suffers death in his stead.]

A MAN FOR THE WORLD.

A successful merchant in New Zealand, a Scotchman, commenced business with the following characteristic entry on the first page of his ledger:—'Commenced business this day—with no money—little credit—and £70 in debt. Faint heart never won fair lady. Set a stout heart to a stay (steep) brace. God save the Queen!'

PRICE 1½d.

VISIT TO THE SCENE OF THE HOLMFIRTH FLOOD.

THE great flood which took place in the valley of Holmfirth in February last, was in itself a deeply-interesting and awe-exciting incident. I was curious to visit the scene, while the results of the catastrophe were still fresh, both on account of the sympathy I felt with the sufferers, and because of some physical problems which I thought might be illustrated by the effects, so far as these were still traceable. I therefore took an opportunity on the 22d of April, to proceed from Manchester to Holmfirth, accompanied by two friends, one of whom, though he had not visited the place since the calamity happened, was well acquainted with the scene and with the country generally, so as to be able to guide us in our walk. A railway excursion to Huddersfield, and a second trip on a different line from that town to the village of Holmfirth, introduced us to a region of softly-rounded hills and winding valleys, precisely resembling those of the Southern Highlands of Scotland, as might indeed be expected from the identity of the formation (Silurian), but which had this peculiar feature in addition, that every here and there was a little cloth-making village, taking advantage of the abundant water-power derived from the mountain-slopes. The swelling heights were brown and bare, like those of Tweeddale; and there the black-cock may still, I believe, be found. The slopes are purely pastoral, with small farmsteadings scattered over them. But down in the bottom of the dale, we see the heavy stone-and-lime mill starting up from the bare landscape, with a sprawling village of mean cottages surrounding it, giving token of an industrial life totally opposite to that which is found beside the silver streams of the Tweed and its tributaries. When we passed near any of these spots, we were sure to catch the unlovely details, so frequently, though so unnecessarily attendant on factory-life—the paltry house, the unpaved, unscavenged street, the fry of dirty children. It was a beautiful tract of natural scenery in the process of being degraded by contact with man and his works.

Arriving at Holmfirth at one o'clock, we found it to be a somewhat better kind of village, chiefly composed of one or two irregular streets running along the bottom of a narrow valley. Hitherto, in passing up the lower part of the vale, we had looked in vain for any traces of the inundation; but now we suddenly found ourselves in the midst of ruin and devastation. Holmfirth is only two miles and a half from the reservoir, and being at a contracted part of the valley, the water came upon it in great depth and with

great force. We found a bridge deprived of its parapets, the boundary-walls of factories broken down, and court-yards filled with debris and mud. Several large houses had end or side walls taken away, or were shattered past remedy. In a narrow street running parallel with the river, and in some places open to it, many of the houses bore chalk-marks a little way up the second storey, indicating the height to which the flood had reached. When we looked across the valley, and mentally scanned the space below that level, we obtained some idea of the immense stream of water which had swept through, or rather over the village.

A rustic guide, obtained at the inn, went on with us through the town, pointing out that in this factory precious machinery had been swept away—in that house a mother and five children had been drowned in their beds—here some wonderful escape had taken place—there had befallen some piteous tragedy. Soon clearing the village, we came to a factory which stood in the bottom of the valley, with some ruined buildings beside it. This had been the property of a Mr Sandford, and he lived close to his mill. Taken completely unprepared by the inundation, he and his family had been carried off, along with nearly every fragment of their house. His body was discovered a considerable time after, at a distance of many miles down the valley. It may be remarked, that about 100 people perished in the flood; and out of that number, at the time of our visit, only one body remained unrecovered.

The catastrophe is too recent to require much detail. It took its origin, as is well known, in a reservoir of water for the use of the mills, formed by a dam across the valley. This had been constructed in 1838, and in an imperfect manner. The embankment, eighty feet in height, sloped outwards and inwards, with facings of masonry, thus obeying the proper rule as to form; but the *puddling*, or clay-casing of the interior, was defective, and it is believed that a spring existed underneath. Some years ago, the embankment began to sink, so that its upper line became a curve, the deepest part of which was eight or ten feet below the uppermost. This should have given some alarm to the commissioners appointed to manage the reservoir; and the danger was actually pointed out, and insisted upon so long ago as 1844. But the commission became insolvent, and went into Chancery; so nothing was done. A sort of safety-valve is provided in such works, exactly of the same nature as the waste-pipe of a common cistern. It consists of a hollow tower of masonry rising within the embankment, in connection with a sluice-passage, or *by-wash*, by which the water may be let off. This tower, rising to within a few feet of the original upper level of the embankment, was of course sure to receive

and discharge any water which might come to the height of its own lip, thus insuring that the water should never quite fill the reservoir, or charge it beyond its calculated strength. By the sluice provision, again, the water could at any time be discharged, even before it reached nearly so high a point. Unfortunately, this part of the work was in an inefficient state, the embankment having itself sunk below the level of the open-mouthed top of the tower, while the sluice below was blocked up with rubbish. It was subsequently declared by the manager, that this defect might have been remedied at any time by an expenditure of £12, 10s. ! If the commission could not or would not advance this small sum, one would have thought that the mill-owners might have seen the propriety of clubbing for so cheap a purchase of safety. They failed to do so, and the destruction of property to the extent of half a million, the interruption of the employment of 7000 people, and the loss of 100 lives, has been the consequence. Surely there never was a more striking illustration of the Old Richard proverb: 'For want of a nail the shoe was lost, for want of a shoe the horse was lost,' &c.

The night between the 4th and 5th of February was one of calm moonlight; but heavy rains had fallen for a fortnight before, and an uncommon mass of water had been accumulated behind the Bilberry embankment. The vague apprehensions of bypast years reviving at this crisis, some neighbours had been on the outlook for a catastrophe. They gathered at midnight round the spot, speculating on what would be the consequence if that huge embankment should burst. There were already three leaks in it, and the water was beginning to pour over the upper edge. A member of the 'sluice-committee' was heard to say, that before two o'clock there would be such a scene as no one had ever seen the like of, and not a mill would be left in the valley. Two persons were then understood to be sent off, to give warning to the people down the valley; but no good account of the proceedings of these two messengers has ever been given. It appears as if the very singularity of the dreaded event created a confidence in its not taking place. By and by, a breach was made in the casing of the embankment just below the top; the water then got in between the casing further down, and the puddle or clay which invested the internal mass, composed of mere rubbish. In half an hour, a great extent of this case was heaved off by the water, and immediately after a tremendous breach was made through the embankment, and an aqueous avalanche poured through. Men then began to run down the valley, to waken the sleepers, but the water ran faster. In a few minutes, it had reached the village, two miles and a half distant, carrying with it nearly everything which came directly in its way. It is said to have taken nearly twenty minutes to pass that village—a fact which gives a striking idea of the enormous mass of water concerned.

About a mile and a half above the village, we came to a modern church, which had been set down in the bottom of the valley, close to the river-side. Entering, we found some curious memorials of the operation of water, in the upbreak of the whole system of flooring and seating, which now lay in irregular distorted masses, mingled with all kinds of rubbish. Bibles and prayer-books still lay about among the seats, as if the people had never so far recovered from the hopeless feeling originally impressed upon them, as to put out a hand for the restoration of order. The position of this church and its fate give occasion for a remark which, if duly remembered and acted upon, may save many a good building from destruction. It should be known, that the meadow close beside a river—what is called in Scotland the *haugh*—is not a suitable place for any building or town, and this simply because it is, strictly speaking, a part of the river-bed. It is the winter or flood-channel of the stream, and has indeed been formed

by it during inundations. Unless, therefore, under favour of strong embankments, no building there can be secure from occasional inundation. Thus, for example, a large part of Westminster, and nearly the whole borough of Southwark, are built where no human dwellings should be. The fair city of Perth is a solecism in point of site, and many a flooding it gets in consequence. When a higher site can be obtained in the neighbourhood, out of reach of floods, it is pure folly to build in a *haugh*—that is, the first plain beside a river.

We were coming within a mile of the Bilberry embankment, when we began to observe a new class of phenomena. Hitherto, the channel of the stream had not exhibited any unusual materials; nor had its banks been much broken, except in a few places. We had been on the outlook to observe if the flood, and the heavy matters with which it was charged, had produced any abrasion of the subjacent rock-structure. No such effects could be traced. We were now, however, getting within the range of the scattered debris of the embankment, and quickly detected the presence of masses of a kind of rubbish different from the rounded pebbles usually found in the bed of a river. There were long *trainées*, composed of mud and clay, including angular blocks of stone, which were constantly increasing in size as we passed onwards. These blocks were the materials of the embankment, which the water had carried thus far. No ploughing up of the channel had taken place, but simply much new matter had been deposited. In some places, these fresh deposits had transgressed into the fields; and where trees were involved, the bark on the side toward the upper part of the valley had generally been rubbed off. Not much more than a quarter of a mile from the reservoir, we found Mrs Birst's mill, or rather a memorial of its former existence, in a tall furnace-chimney, for literally no more survives. The deposit of rubbish was here eight or ten feet deep, and a number of workmen were engaged in excavating from it fragments of machinery and other articles. They had cleared out the ground-rooms of the house, though little more than the base of the walls remained. The scene was precisely like an excavation at Herculaneum. The outline of the rooms was beginning to be traceable. A grate and a fireplace appeared. We observed a child's shoe taken out and laid aside—an affecting image of the household desolation which had taken place. Mrs Birst, however, and her whole family, had been fortunate enough to escape with life, although with the loss of all their property. This mill, from its nearness to the reservoir, as well as the contractedness of the valley at the spot, had experienced the violence of the flood in a degree of intensity unknown elsewhere.

The space between Mrs Birst's mill and the reservoir is for a good way comparatively open, and here some good land had been completely destroyed; but for two or three hundred yards below the reservoir the valley is very narrow, and there some extraordinary effects are observable. The flood, at its first outburst here, has exercised great force upon the sides of the valley, carrying off from the cliffs several huge blocks, which it has transported a good way down. Three of from five to seven tons' weight are spoken of as carried half a mile, and one of probably twenty tons is seen about a quarter of a mile below the place whence it evidently has been torn. These are prodigies to the rustic population, little accustomed to think of the dynamics of water, and totally ignorant of the deduction made in such circumstances from the specific gravity of any heavy mass carried by it. Geologists, who have looked into the great question of erratic blocks, are less apt to be startled by such phenomena.

Some of these gentlemen will, I suspect, find the transport of blocks at Holmfirth less remarkable than they could have desired. It is well known that, while

most of them ascribe the travelling of boulders to the working of ice in former times, one or two persist in thinking that water may have done it all. The present president of the Geological Society has endeavoured to shew, by mathematical reasonings chiefly, that the blocks of Shap Fell granite, scattered to the south and east in Yorkshire, may have been carried there by a retreating wave, on the mountain being suddenly raised out of the sea. Now here is a moving flood, of greater force than any retreating wave could well be; and yet we see that it does not carry similar blocks a hundredth part of the way to which those masses of Shap Fell have been transported, even although their course was all downwards moreover—a different case from that of many of the Shap boulders, which are found to have breasted considerable heights before resting where they now are.

At length, after a toilsome walk along the rough surface of the debris, we reached the place whence this wonderful flood had burst. We found on each side of the valley a huge lump of the embankment remaining, while a vast gulf yawned between. This was somewhat different from what we expected; for we had seen it stated in the newspapers, that the whole was swept away. So far from this being the case, fully half of the entire mass remains, including portions of that central depression which has been spoken of. There is more importance in remarking this fact than may at first sight appear. In the investigation of the mysterious subject of the Parallel Roads of Glenroy, one theory has been extensively embraced—that they were produced by a lake, which has since burst its bounds and been discharged. It has been asked: Where was the dam that retained this lake? and should we not expect, if there was any such dam, that it could not be wholly swept away? Would not fragments of it be found at the sides of the valley—the breaking down of the centre being sufficient to allow the waters to pass out? When we look at the masses left on each side of the Bilberry embankment, we see the force and pertinence of these queries, and must admit that the lake theory is so far weakened. In the bottom of the breach, a tiny rill is now seen making its exit—the same stream which cumulatively took so formidable a shape a few months ago. For a mile up the valley, we see traces of the ground having been submerged. Immediately within the embankment, on the right side of the streamlet, is the empty tower or by-wash, that dismal monument of culpable negligence. We gazed on it with a strange feeling, thinking how easy it would have been to demolish two or three yards of it, so as to allow an innocuous outlet to the pent-up waters. When we had satisfied our curiosity, we commenced a toilsome march across the hills to a valley, in which there has lately been formed a series of embankments for the saving up of water for the supply of the inhabitants of Manchester. About six in the evening, we reached a public-house called the 'Solitary Shepherd,' where we had tea and a rest; after which, a short walk in the dusk of the evening brought us to a station of the Manchester and Sheffield Railway, by which we were speedily replaced in Manchester, thus accomplishing our very interesting excursion in about ten hours.

My final reflections on what we had seen were of a mixed order. Viewing the inundation as a calamity which might have been avoided by a simple and inexpensive precaution, one could not but feel that it stood up as a sore charge against human wisdom. That so huge a danger should have been treated so lightly; that men should have gone on squabbling about who should pay a mere trifle of money, when such large interests and so many lives were threatened by its non-expenditure, certainly presents our mercantile *laissez-faire* system in a most disagreeable light. But, then, view the other side. When once the calamity

had taken place, and the idea of the consequent extensive suffering had got abroad amongst the public, thousands of pounds came pouring in for the relief of that suffering. The large sum of £60,000 was collected for the unfortunates; and it is an undoubted, though surprising fact, that the collectors had at last to intimate that they required no more. It is thus that human nature often appears unworthy and contemptible when contemplated with regard to some isolated circumstance, as misanthropes, poets, and such like, are apt to regard it. But take it in wider relations, take it in the totality of its action, and the lineaments of its divine origin and inherent dignity are sure to shine out.

REMINISCENCES OF AN ATTORNEY.

THE INCENDIARY.

I KNEW James Dutton, as I shall call him, at an early period of life, when my present scanty locks of iron-gray were thick and dark, my now pale and furrowed cheeks were fresh and ruddy, like his own. Time, circumstance, and natural bent of mind, have done their work on both of us; and if his course of life has been less equable than mine, it has been chiefly so because the original impulse, the first start on the great journey, upon which so much depends, was directed by wiser heads in my case than in his. We were school-fellows for a considerable time; and if I acquired—as I certainly did—a larger stock of knowledge than he, it was by no means from any superior capacity on my part, but that his mind was bent on other pursuits. He was a born Nimrod, and his father encouraged this propensity from the earliest moment that his darling and only son could sit a pony, or handle a light fowling-piece. Dutton, senior, was one of a then large class of persons, whom Cobbett used to call bull-frog farmers; men who, finding themselves daily increasing in wealth by the operation of circumstances they neither created nor could insure or control—namely, a rapidly increasing manufacturing population, and tremendous war-prices for their produce—acted as if the chance-blown prosperity they enjoyed was the result of their own forethought, skill, and energy, and therefore, humanly speaking, indestructible. James Dutton was, consequently, denied nothing—not even the luxury of neglecting his own education; and he availed himself of the lamentable privilege to a great extent. It was, however, a remarkable feature in the lad's character, that whatever he himself deemed essential should be done, no amount of indulgence, no love of sport or dissipation, could divert him from thoroughly accomplishing. Thus he saw clearly, that even in the life—that of a sportsman-farmer—he had chalked out for himself, it was indispensably necessary that a certain quantum of educational power should be attained; and so he really acquired a knowledge of reading, writing, and spelling, and then withdrew from school to more congenial avocations.

I frequently met James Dutton in after-years; but some nine or ten months had passed since I had last seen him, when I was directed by the chief partner in the firm to which Flint and I subsequently succeeded, to take coach for Romford, Essex, in order to ascertain from a witness there what kind of evidence we might expect him to give in a trial to come off in the then Hilary term, at Westminster Hall. It was the first week in January: the weather was bitterly cold; and I experienced an intense satisfaction when, after despatching the business I had come upon, I found myself in the long dining-room of the chief market-inn, where two blazing fires shed a ruddy, cheerful light over the snow-white damask table-cloth, bright glasses, decanters, and other preparatives for the farmers' market-dinner. Prices had ruled high that day; wheat had reached £30 a load; and the

numerous groups of hearty, stalwart yeomen present were in high glee, crowing and exulting alike over their full pockets and the news—of which the papers were just then full—of the burning of Moscow, and the flight and ruin of Bonaparte's army. James Dutton was in the room, but not, I observed, in his usual flow of animal spirits. The crape round his hat might, I thought, account for that; and as he did not see me, I accosted him with an inquiry after his health, and the reason of his being in mourning. He received me very cordially, and in an instant cast off the abstracted manner I had noticed. His father, he informed me, was gone—had died about seven months previously, and he was alone now at Ash Farm—why didn't I run down there to see him sometimes, &c.? Our conversation was interrupted by a summons to dinner, very cheerfully complied with; and we both—at least I can answer for myself—did ample justice to a more than usually capital dinner, even in those capital old market-dinner times. We were very jolly afterwards, and amazingly triumphant over the frost-bitten, snow-buried soldier-banditti that had so long lorded it over continental Eufope. Dutton did not partake of the general hilarity. There was a sneer upon his lip during the whole time, which, however, found no expression in words.

'How quiet you are, James Dutton!' cried a loud voice from out the dense smoke-cloud that by this time completely enveloped us. On looking towards the spot from whence the ringing tones came, a jolly, round face—like the sun as seen through a London fog—gleamed redly dull from out the thick and choking atmosphere.

'Everybody,' rejoined Dutton, 'hasn't had the luck to sell two hundred quarters of wheat at to-day's price, as you have, Tom Southall.'

'That's true, my boy,' returned Master Southall, sending, in the plenitude of his satisfaction, a jet of smoke towards us with astonishing force. 'And, I say, Jem, I'll tell ee what I'll do; I'll clap on ten guineas more upon what I offered for the brown mare.'

'Done! She's yours, Tom, then, for ninety guineas!'

'Gie's your hand upon it!' cried Tom Southall, jumping up from his chair, and stretching a fist as big as a leg of mutton—well, say lamb—over the table. 'And here—here,' he added, with an exultant chuckle, as he extricated a swollen canvas-bag from his pocket—'here's the dibs at once.'

This transaction excited a great deal of surprise at our part of the table; and Dutton was rigorously cross-questioned as to his reason for parting with his favourite hunting mare.

'The truth is, friends,' said Dutton at last, 'I mean to give up farming, and—'

'Gie up farmin'!' broke in half-a-dozen voices. 'Lord!'

'Yes; I don't like it. I shall buy a commission in the army. There'll be a chance against Boney, now; and it's a life I'm fit for.'

The farmers looked completely agape at this announcement; but making nothing of it, after silently staring at Dutton and each other, with their pipes in their hands and not in their mouths, till they had gone out, stretched their heads simultaneously across the table towards the candles, relit their pipes, and smoked on as before.

'Then, perhaps, Mr Dutton,' said a young man in a smartly-cut velvet coat with mother-of-pearl buttons, who had hastily left his seat further down the table—'perhaps you will sell the double Manton, and Fanny and Slut?'

'Yes; at a price.'

Prices were named; I forget now the exact sums, but enormous prices, I thought, for the gun and the dogs, Fanny and Slut. The bargain was eagerly con-

cluded, and the money paid at once. Possibly the buyer had a vague notion, that a portion of the vender's skill might come to him with his purchases.

'You be in 'arnest, then, in this fool's business, James Dutton,' observed a farmer gravely. 'I be sorry for thee; but as I s'pose the lease of Ash Farm will be parted with; why— John, waiter, tell Master Hurst at the top of the table yonder, to come this way.'

Master Hurst, a well-to-do, highly respectable-looking, and rather elderly man, came in obedience to the summons, and after a few words in an under-tone with the friend that had sent for him, said: 'Is this true, James Dutton?'

'It is true that the lease and stock of Ash Farm are to be sold—at a price. You, I believe, are in want of such a concern for the young couple, just married.'

'Well, I don't say I might not be a customer, if the price were reasonable.'

'Let us step into a private room, then,' said Dutton rising. 'This is not a place for business of that kind. Sharp,' he added, *sotto voce*, 'come with us; I may want you.'

I had listened to all this with a kind of stupid wonderment, and I now, mechanically as it were, got up and accompanied the party to another room.

The matter was soon settled. Five hundred pounds for the lease—ten years unexpired—of Ash Farm, about eleven hundred acres, and the stock, implements; the ploughing, sowing, &c. already performed, to be paid for at a valuation based on present prices. I drew out the agreement in form, it was signed in duplicate, a large sum was paid down as deposit, and Mr Hurst with his friend withdrew.

'Well, I said, taking a glass of port from a bottle Dutton had just ordered in—'here's fortune in your new career; but as I am a living man, I can't understand what you can be thinking about.'

'You haven't read the newspapers?'

'O yes, I have! Victory! Glory! March to Paris! and all that sort of thing. Very fine, I dare say; but rubbish, moonshine, I call it, if purchased by the abandonment of the useful, comfortable, joyous life of a prosperous yeoman.'

'Is that all you have seen in the papers?'

'Not much else. What, besides, have you found in them?'

'Wheat, at ten or eleven pounds a load—less perhaps—other produce in proportion.'

'Ha!'

'I see further, Sharp, than you bookmen do, in some matters. Boney's done for; that to me is quite plain, and earlier than I thought likely; although I, of course, as well as every other man with a head instead of a turnip on his shoulders, knew such a raw-head-and-bloody-bones as that must sooner or later come to the dogs. And as I also know what agricultural prices were before the war, I can calculate without the aid of vulgar fractions, which, by the by, I never reached, what they'll be when it's over, and the thundering expenditure now going on is stopped. In two or three weeks, people generally will get a dim notion of all this; and I sell, therefore, whilst I can, at top prices.'

The shrewdness of the calculation struck me at once. 'You will take another farm when one can be had on easier terms than now, I suppose?'

'Yes; if I can manage it. And I will manage it. Between ourselves, after all the old man's debts are paid, I shall only have about nine or ten hundred pounds to the good, even by selling at the present tremendous rates; so it was time, you see, I pulled up, and rubbed the fog out of my eyes a bit. And, hark ye, Master Sharp!' he added, as we rose and shook hands with each other—'I have now done *playing* with the world—it's a place of work and business; and I'll do my share of it so effectually, that my children, if I

have any, shall, if I do not, reach the class of landed gentry; and this you'll find, for all your sneering, will come about all the more easily that neither they nor their father will be encumbered with much educational lumber. Good-by.'

I did not again see my old school-fellow till the change he had predicted had thoroughly come to pass. Farms were everywhere to let, and a general cry to parliament for aid rang through the land. Dutton called at the office upon business, accompanied by a young woman of remarkable personal comeliness, but, as a very few sentences betrayed, little or no education in the conventional sense of the word. She was the daughter of a farmer, whom—it was no fault of hers—a change of times had not found in a better condition for weathering them. Anne Mosely, in fact, was a thoroughly industrious, clever farm economist. The instant Dutton had secured an eligible farm, at his own price and conditions, he married her; and now, on the third day after the wedding, he had brought me the draft of lease for examination.

'You are not afraid, then,' I remarked, 'of taking a farm in these bad times?'

'Not I—at a price. We mean to *rough* it, Mr Sharp,' he added gaily. 'And, let me tell you, that those who will stoop to do that—I mean, take their coats off, tuck up their sleeves, and fling appearances to the winds—may, and will, if they understand their business, and have got their heads screwed on right, do better here than in any of the uncleared countries they talk so much about. You know what I told you down at Romford. Well, we'll manage that before our hair is gray, depend upon it, bad as the times may be—won't we, Nance?'

'We'll try, Jem,' was the smiling response.

They left the draft for examination. It was found to be correctly drawn. Two or three days afterwards, the deeds were executed, and James Dutton was placed in possession. The farm, a capital one, was in Essex.

His hopes were fully realised as to money-making, at all events. He and his wife rose early, sat up late, ate the bread of carefulness, and altogether displayed such persevering energy, that only about six or seven years had passed before the Duttons were accounted a rich and prosperous family. They had one child only—a daughter. The mother, Mrs Dutton, died when this child was about twelve years of age; and Anne Dutton became more than ever the apple of her father's eye. The business of the farm went steadily on in its accustomed track; each succeeding year found James Dutton growing in wealth and importance; and his daughter in sparkling, catching comeliness—although certainly not in the refinement of manner which gives a quickening life and grace to personal symmetry and beauty. James Dutton remained firm in his theory of the worthlessness of education beyond what, in a narrow acceptance of the term, was absolutely 'necessary'; and Anne Dutton, although now heiress to very considerable wealth, knew only how to read, write, spell, cast accounts, and superintend the home-business of the farm. I saw a good deal of the Duttons about this time, my brother-in-law, Elsworthy, and his wife having taken up their abode within about half a mile of James Dutton's dwelling-house; and I ventured once or twice to remonstrate with the prosperous farmer upon the positive danger, with reference to his ambitious views, of not at least so far cultivating the intellect and taste of so attractive a maiden as his daughter, that sympathy on her part with the rude, unlettered clowns, with whom she necessarily came so much in contact, should be impossible. He laughed my hints to scorn. 'It is idleness—idleness alone,' he said, 'that puts love-fancies into girls' heads. Novel-reading, jingling at a pianoforte—merely other names for idleness—these are the parents of such follies. Anne Dutton, as mistress of this establishment, has her time fully and

usefully occupied; and when the time comes, not far distant now, to establish her in marriage, she will wed into a family I wot of; and the Romford prophecy of which you remind me will be realised, in great part at least.'

He found, too late, his error. He hastily entered the office one morning, and although it was only five or six weeks since I had last seen him, the change in his then florid, prideful features was so striking and painful, as to cause me to fairly leap upon my feet with surprise.

'Good Heavens, Dutton!' I exclaimed, 'what is the matter? What has happened?'

'Nothing has happened, Mr Sharp,' he replied, 'but what you predicted, and which, had I not been the most conceited dolt in existence, I, too, must have foreseen. You know that good-looking, idle, and, I fear, irreclaimable young fellow, George Hamblin?'

'I have seen him once or twice. Has he not brought his father to the verge of a workhouse by low dissipation and extravagance?'

'Yes. Well, he is an accepted suitor for Anne Dutton's hand. No wonder that you start. She fancies herself hopelessly in love with him—Nay, Sharp, hear me out. I have tried expostulation, threats, entreaties, locking her up; but it's useless. I shall kill the silly fool if I persist, and I have at length consented to the marriage; for I cannot see her die.' I began remonstrating upon the folly of yielding consent to so ruinous a marriage, on account of a few tears and hysterics, but Dutton stopped me peremptorily.

'It is useless talking,' he said. 'The die is cast; I have given my word. You would hardly recognise her, she is so altered. I did not know before,' added the strong, stern man, with trembling voice and glistening eyes, 'that she was so inextricably twined about my heart—my life!' It is difficult to estimate the bitterness of such a disappointment to a proud, aspiring man like Dutton. I pitied him sincerely, mistaken, if not blameworthy, as he had been.

'I have only myself to blame,' he presently resumed. 'A girl of cultivated taste and mind could not have bestowed a second thought on George Hamblin. But let's to business. I wish the marriage-settlement, and my will, to be so drawn, that every farthing received from me during my life, and after my death, shall be hers, and hers only; and so strictly and entirely secured, that she shall be without power to yield control over the slightest portion of it, should she be so minded.' I took down his instructions, and the necessary deeds were drawn in accordance with them. When the day for signing arrived, the bridegroom-elect demurred at first to the stringency of the provisions of the marriage-contract; but as upon this point Mr Dutton was found to be inflexible, the handsome, illiterate clown—he was little better—gave up his scruples, the more readily as a life of assured idleness lay before him, from the virtual control he was sure to have over his wife's income. These were the thoughts which passed across his mind, I was quite sure, as taking the pen awkwardly in his hand, he affixed his mark to the marriage-deed. I reddened with shame, and the smothered groan which at the moment smote faintly on my ear, again brokenly confessed the miserable folly of the father in not having placed his beautiful child beyond all possibility of mental contact or communion with such a person. The marriage was shortly afterwards solemnised, but I did not wait to witness the ceremony.

The husband's promised good-behaviour did not long endure; ere two months of wedded life were past, he had fallen again into his old habits; and the wife, bitterly repentant of her folly, was fain to confess, that nothing but dread of her father's vengeance saved her from positive ill usage. It was altogether a wretched, unfortunate affair; and the intelligence—sad in itself—which reached me about a twelvemonth after the marriage, that the young mother had died in childbirth

of her first-born, a girl, appeared to me rather a matter of rejoicing than of sorrow or regret. The shock to poor Dutton was, I understood, overwhelming for a time, and fears were entertained for his intellects. He recovered, however, and took charge of his grandchild, the father very willingly resigning the onerous burden.

My brother-in-law left James Dutton's neighbourhood for a distant part of the country about this period, and I saw nothing of the bereaved father for about five years, save only at two business interviews. The business upon which I had seen him, was the alteration of his will, by which all he might die possessed of was bequeathed to his darling Annie. His health, I was glad to find, was quite restored; and although now fifty years of age, the bright light of his young days sparkled once more in his keen glance. His youth was, he said, renewed in little Annie. He could even bear to speak, though still with remorseful emotion, of his own lost child. 'No fear, Sharp,' he said, 'that I make that terrible mistake again. Annie will fall in love, please God, with no unlettered, soulless booby! Her mind shall be elevated, beautiful, and pure, as her person—she is the image of her mother—promises to be charming and attractive. You must come and see her.' I promised to do so; and he went his way. At one of these interviews—the first it must have been—I made a chance inquiry for his son-in-law, Hamblin. As the name passed my lips, a look of hate and rage flashed out of his burning eyes. I did not utter another word, nor did he; and we separated in silence.

It was evening, and I was returning in a gig from a rather long journey into the country, when I called, in redemption of my promise, upon James Dutton. Annie was really, I found, an engaging, pretty, blue-eyed, golden-haired child; and I was not so much surprised at her grandfather's doting fondness—a fondness entirely reciprocated, it seemed, by the little girl. It struck me, albeit, that it was a perilous thing for a man of Dutton's vehement, fiery nature to stake again, as he evidently had done, his all of life and happiness upon one frail existence. An illustration of my thought or fear occurred just after we had finished tea. A knock was heard at the outer-door, and presently a man's voice, in quarrelling, drunken remonstrance with the servant who opened it. The same deadly scowl I had seen sweep over Dutton's countenance upon the mention of Hamblin's name, again gleamed darkly there; and finding, after a moment or two, that the intruder would not be denied, the master of the house gently removed Annie from his knee, and strode out of the room.

'Follow grandpapa,' whispered Mrs Rivers, a highly respectable widow of about forty years of age, whom Mr Dutton had engaged at a high salary to superintend Annie's education. The child went out, and Mrs Rivers, addressing me, said in a low voice: 'Her presence will prevent violence; but it is a sad affair.' She then informed me that Hamblin, to whom Mr Dutton allowed a hundred a year, having become aware of the grandfather's extreme fondness for Annie, systematically worked that knowledge for his own sordid ends, and preluded every fresh attack upon Mr Dutton's purse by a threat to reclaim the child. 'It is not the money,' remarked Mrs Rivers in conclusion, 'that Mr Dutton cares so much for, but the thought that he holds Annie by the sufferance of that wretched man, goads him at times almost to insanity.'

'Would not the fellow waive his claim for a settled increase of his annuity?'

'No; that has been offered to the extent of three hundred a year; but Hamblin refuses, partly from the pleasure of keeping such a man as Mr Dutton in his power, partly because he knows that the last shilling would be parted with rather than the child. It is a very unfortunate business, and I often fear will terminate badly.' The loud but indistinct wrangling without ceased after awhile, and I heard a key turn

stiffly in a lock. 'The usual conclusion of these scenes,' said Mrs Rivers. 'Another draft upon his strong-box will purchase Mr Dutton a respite as long as the money lasts.' I could hardly look at James Dutton when he re-entered the room. There was that in his countenance which I do not like to read in the faces of my friends. He was silent for several minutes; at last he said quickly, sternly: 'Is there no instrument, Mr Sharp, in all the enginery of law, that can defeat a worthless villain's legal claim to his child?'

'None; except, perhaps, a commission of lunacy, or'—

'Tush! tush!' interrupted Dutton; 'the fellow has no wits to lose. That being so— But let us talk of something else.' We did so, but on his part very incoherently, and I soon bade him good-night.

This was December, and it was in February the following year that Dutton again called at our place of business. There was a strange, stern, iron meaning in his face. 'I am in a great hurry,' he said, 'and I have only called to say, that I shall be glad if you will run over to the farm to-morrow on a matter of business. You have seen, perhaps, in the paper, that my dwelling-house took fire the night before last. You have not? Well, it is upon that I would consult you. Will you come?' I agreed to do so, and he withdrew.

The fire had not, I found, done much injury. It had commenced in a kind of miscellaneous store-room; but the origin of the fire appeared to me, as it did to the police-officers that had been summoned, perfectly unaccountable. 'Had it not been discovered in time, and extinguished,' I observed to Mrs Rivers, 'you would all have been burned in your beds.'

'Why, no,' replied that lady, with some strangeness of manner. 'On the night of the fire, Annie and I slept at Mr Elsworth's' (I have omitted to notice, that my brother-in-law and family had returned to their old residence, 'and Mr Dutton remained in London, whither he had gone to see the play.'

'But the servants might have perished?'

'No. A whim, apparently, has lately seized Mr Dutton, that no servant or labourer shall sleep under the same roof with himself; and those new outhouses, where their bedrooms are placed are, you see, completely detached, and are indeed, as regards this dwelling, made fire-proof.'

At this moment Mr Dutton appeared, and interrupted our conversation. He took me aside. 'Well,' he said, 'to what conclusion have you come? The work of an incendiary, is it not? Somebody, too, that knows I am not insured'—

'Not insured!'

'No; not for this dwelling-house. I did not renew the policy some months ago.'

'Then,' I jestingly remarked, 'you, at all events, are safe from any accusation of having set fire to your premises with the intent to defraud the insurers.'

'To be sure—to be sure, I am,' he rejoined with quick earnestness, as if taking my remark seriously. 'That is quite certain. Some one, I am pretty sure it must be,' he presently added, 'that owes me a grudge—with whom I have quarrelled, eh?'

'It may be so, certainly.'

'It must be so. And what, Mr Sharp, is the highest penalty for the crime of incendiarism?'

'By the recent change in the law, transportation only; unless, indeed, loss of human life occur in consequence of the felonious act; in which case, the English law construes the offence to be wilful murder, although the incendiary may not have intended the death or injury of any person.'

'I see. But here there could have been no loss of life.'

'There might have been, had not you, Mrs Rivers, and Annie, chanced to sleep out of the house.'

'True—true—a diabolical villain no doubt. But

we'll ferret him out yet. You are a keen hand, Mr Sharp, and will assist, I know. Yes, yes—it's some fellow that hates me—that I perhaps hate and loathe—he added with sudden gnashing fierceness, and striking his hand with furious violence on the table—'as I do a spotted toad!'

I hardly recognised James Dutton in this fitful, disjointed talk, and as there was really nothing to be done or to be inquired into, I soon went away.

'Only one week's interval,' I hastily remarked to Mr Flint one morning after glancing at the newspaper, 'and another fire at Dutton's farmhouse!'

'The deuce! He is in the luck of it apparently,' replied Flint, without looking up from his employment. My partner knew Dutton only by sight.

The following morning, I received a note from Mrs Rivers. She wished to see me immediately on a matter of great importance. I hastened to Mr Dutton's, and found, on arriving there, that George Hamblin was in custody, and undergoing an examination, at no great distance off, before two county magistrates, on the charge of having fired Mr Dutton's premises. The chief evidence was, that Hamblin had been seen lurking about the place just before the flames broke out, and that near the window where an incendiary might have entered there were found portions of several lucifer-matches, of a particular make, and corresponding to a number found in Hamblin's bedroom. To this Hamblin replied, that he had come to the house by Mr Dutton's invitation, but found nobody there. This, however, was vehemently denied by Mr Dutton. He had made no appointment with Hamblin to meet at his, Dutton's, house. How should he, purposing as he did to be in London at the time? With respect to the lucifer-matches, Hamblin said he had purchased them of a mendicant, and that Mr Dutton saw him do so. This also was denied. It was further proved, that Hamblin, when in drink, had often said he would ruin Dutton before he died. Finally, the magistrates, though with some hesitation, decided that there was hardly sufficient evidence to warrant them in committing the prisoner for trial, and he was discharged, much to the rage and indignation of the prosecutor.

Subsequently, Mrs Rivers and I had a long private conference. She and the child had again slept at Elsworth's on the night of the fire, and Dutton in London. 'His excuse is,' said Mrs Rivers, 'that he cannot permit us to sleep here unprotected by his presence.' We both arrived at the same conclusion, and at last agreed upon what should be done, attempted rather, and that without delay.

Just before taking leave of Mr Dutton, who was in an exceedingly excited state, I said: 'By the by, Dutton, you have promised to dine with me on some early day. Let it be next Tuesday. I shall have one or two bachelor friends, and we can give you a shake-down for the night.'

'Next Tuesday?' said he quickly. 'At what hour do you dine?'

'At six. Not a half-moment later.'

'Good! I will be with you.' We then shook hands, and parted.

The dinner would have been without interest to me, had not a note previously arrived from Mrs Rivers, stating that she and Annie were again to sleep that night at Elsworth's. This promised results.

James Dutton, who rode into town, was punctual, and, as always of late, flurried, excited, nervous—not, in fact, it appeared to me precisely in his right mind. The dinner passed off as dinners usually do, and the after-proceedings went on very comfortably till about half-past nine o'clock, when Dutton's perturbation, increased perhaps by the considerable quantity of wine he had swallowed, not drunk, became, it was apparent to everybody, almost uncontrollable. He rose—purposeless it seemed—sat down again—drew

out his watch almost every minute, and answered remarks addressed to him in the wildest manner. The decisive moment was, I saw, arrived, and at a gesture of mine, Elsworth, who was in my confidence, addressed Dutton. 'By the way, Dutton, about Mrs Rivers and Annie. I forgot to tell you of it before.'

The restless man was on his feet in an instant, and glaring with fiery eagerness at the speaker.

'What! what!' he cried with explosive quickness—'what about Annie? Death and fury!—speak! will you?'

'Don't alarm yourself, my good fellow. It's nothing of consequence. You brought Annie and her governess, about an hour before I started, to sleep at our house'—

'Yes—yes,' gasped Dutton, white as death, and every fibre of his body shaking with terrible dread. 'Yes—well, well, go on. Thunder and lightning! out with it, will you?'

'Unfortunately, two female cousins arrived soon after you went away, and I was obliged to escort Annie and Mrs Rivers home again.' A wild shriek—yell is perhaps the more appropriate expression—burst from the conscience and fear-stricken man. Another instant, and he had torn his watch from the fob, glanced at it with dilated eyes, dashed it on the table, and was rushing madly towards the door, vainly withstood by Elsworth, who feared we had gone too far.

'Out of the way!' screamed the madman. 'Let go, or I'll dash you to atoms!' Suiting the action to the threat, he hurled my brother-in-law against the wall with stunning force, and rushed on, shouting incoherently: 'My horse! There is time yet! Tom Edwards, my horse!'

Tom Edwards was luckily at hand, and although mightily surprised at the sudden uproar, which he attributed to Mr Dutton being in drink, mechanically assisted to saddle, bridle, and bring out the roan mare; and before I could reach the stables, Dutton's foot was in the stirrup. I shouted 'Stop' as loudly as I could, but the excited horseman did not heed, perhaps not hear me: and away he went, at a tremendous speed, hatless, and his long gray-tinted hair streaming in the wind. It was absolutely necessary to follow. I therefore directed Elsworth's horse, a much swifter and more peaceful animal than Dutton's, to be brought out; and as soon as I got into the high country road, I too dashed along at a rate much too headlong to be altogether pleasant. The evening was clear and bright, and I now and then caught a distant sight of Dutton, who was going at a frantic pace across the country, and putting his horse at leaps that no man in his senses would have attempted. I kept the high-road, and we had thus ridden about half an hour perhaps, when a bright flame about a mile distant, as the crow flies, shot suddenly forth, strongly relieved against a mass of dark wood just beyond it. I knew it to be Dutton's house, even without the confirmation given by the frenzied shout which at the same moment arose on my left hand. It was from Dutton. His horse had been *staked*, in an effort to clear a high fence, and he was hurrying desperately along on foot. I tried to make him hear me, or to reach him, but found I could do neither: his own wild cries and imprecations drowned my voice, and there were impassable fences between the high-road and the fields across which he madly hastened.

The flames were swift this time, and defied the efforts of the servants and husbandmen who had come to the rescue, to stay, much less to quell them. Eagerly as I rode, Dutton arrived before the blazing pile at nearly the same moment as myself, and even as he fiercely struggled with two or three men, who strove by main force to prevent him from rushing into the flames, only to meet with certain death, the roof and floors of the building fell in with a sudden crash. He believed that all was over with the child, and again hurling forth the

wild despairing cry I had twice before heard that evening, he fell down, as if smitten by lightning, upon the hard frosty road.

It was many days ere the unhappy, sinful man recovered his senses, many weeks before he was restored to his accustomed health. Very cautiously had the intelligence been communicated to him, that Annie had not met the terrible fate, the image of which had incessantly pursued him through his fevered dreams. He was a deeply grateful, and, I believe, a penitent and altogether changed man. He purchased, through my agency, a valuable farm in a distant county, in order to be out of the way, not only of Hamblin, on whom he settled two hundred a year, but of others, myself included, who knew or suspected him of the foul intention he had conceived against his son-in-law, and which, but for Mrs Rivers, would, on the last occasion, have been in all probability successful, so cunningly had the evidence of circumstances been devised. 'I have been,' said James Dutton to me at the last interview I had with him, 'all my life an overweening self-confident fool. At Romford, I boasted to you that my children should ally themselves with the landed gentry of the country, and see the result! The future, please God, shall find me in my duty—mindful only of that, and content, whilst so acting, with whatever shall befall me or mine.'

Dutton continues to prosper in the world; Hamblin died several years ago of delirium tremens; and Annie, I hear, will in all probability marry into the squirearchy of the country. All this is not perhaps what is called poetical justice, but my experience has been with the actual, not the ideal world.

MEMORIALS OF THE DODO.

Among the thousand-and-one marvels displayed in the far-famed Palace of Crystal during part of the last ever-memorable year, not the least puzzling to the majority of visitors, was an object resembling a stuffed bird more than any other production of art or nature, but very unlike any bird previously observed by the wondering spectators in either museum or menagerie, or even on the painted panels that emblazon the crude and extravagant conceptions of mediæval heraldry. In the catalogue, the really ingenious piece of workmanship was entitled a 'Life-size model of the dodo'—a name, our readers know, appertaining to a now extinct bird, the very existence of which was at one time denied by shrewd men and good naturalists. Perhaps the following history of this curious creature, from its first to its last appearance before the eyes of men, will not be considered devoid of interest.

In the year 1598, a division of a Dutch squadron on its way to Bantam, rediscovered what was then called the island of Cerne; and a boat's crew having been sent ashore to reconnoitre, returned with nine great birds, a number of smaller ones, and the welcome intelligence of a secure and convenient harbour. Those nine great birds were the first of the doomed dodo race that ever came in contact with their destined destroyer, man; at least, this is undoubtedly their first appearance on record. The exact date of such an event is note-worthy: it occurred on the 18th of May. De Warwijk, the Dutch admiral, brought his ships into the harbour; and finding no traces of man—the birds being so unused to his presence, that they suffered themselves to be caught by hand—took formal possession of the island, changing its name to Mauritius, in honour of Prince Maurice, then Stadtholder of Holland. Immense tortoises, delicious fish, thousands of turtle-doves, and dodos à discrétion, regaled the half-starved and scurvy-stricken seamen. The name dodo, however, had not then been given. Warwijk's men, revelling in the luxuries of this virgin isle, became fastidious. Finding, after a hearty meal on the newly-discovered

bird, that its extreme fatness disagreed with them, they gave it the name of *walghvogel**—the nausea-causing bird. With our own experience—and that is somewhat extensive—of sailors in general, and Dutch ones in particular, we must infer that these dodos were very, very fat, indeed. A narrative of this voyage† was published in Dutch at Amsterdam in 1601, went through many editions, and has been translated into various languages. The work contains an engraving, representing the landing-place at the Mauritius; the carpenters, coopers, and blacksmiths, busy at work; the preacher and his orderly congregation; while tortoises, a dodo, and other animals, wander about, heedless of the presence of man. This is the first engraving of the dodo, and, judging from more pictures of greater pretension, by no means a bad likeness; indeed, the whole sketch bears strong evidence of its having been taken from nature. In the letter-press, the *walghvogel* is described as a large bird, the size of a swan, with a huge head furnished with a kind of hood; and in lieu of wings, having three or four small pen-feathers, the tail consisting of four or five small curled feathers of a gray colour.

De Bry, an engraver of considerable eminence, and a bookseller at Frankfort-on-the-Maine, being in England in 1587, was induced by our famous compiler, Hakluyt, to commence the publication of an illustrated series of voyages, which, after his death, was continued by his sons. Amongst bibliographers, this compilation is well known as the *Collection of Great and Little Voyages*. The volumes comprising the 'little voyages,' relating exclusively to the East, are entitled *Indiæ Orientalis*; they were issued in parts, and their period of publication extended from 1598 to 1624. The *walghvogel* is merely mentioned, but an engraving gives a fanciful representation of the doings of another Dutch crew on the island. Two gallants, elaborately attired, are represented riding on a tortoise; while ten others, seated in a tortoise's shell, are holding a grand symposium. Three birds are depicted in this plate, which the letter-press says are *walghvogels*, but which our eyes tell us are cassowaries, then termed *emeas*. It is evident, then, that De Bry had not, at that time, seen a sketch or description of the dodo: if he had, he would not thus have confounded it with the cassowary. Moreover, in the letter-press explanatory of the engraving, it is stated that a living *walghvogel* had been brought to Holland, which clearly proves that he had erroneously confounded the two birds; for a living cassowary, even at that early date, had actually been transported thither. But though there can be little doubt, that one or more living dodos were subsequently brought to Europe, it is certain that such an event did not take place till after L'Ecluse wrote, in 1605. About the same time that De Bry published this fourth part of *Indiæ Orientalis*, the Dutch work appeared containing the account of the voyages of the whole eight ships; and then De Bry, in his fifth part, which came out later in the same year, was enabled to give a correct representation of the dodo, and a complete account of the voyages of the whole squadron. We have been more precise on this part of our subject than might seem necessary; but by being so, we have smoothed over an inequality that has been a stumbling-block to almost all previous writers on the dodo.

L'Ecluse, professor of botany at Leyden, one of the greatest naturalists of his age, published his *Exoticorum* in 1605. In it he gives an engraved likeness and description of the dodo, which he obtained from persons who had sailed in De Warwijk's fleet, stating that he had himself seen only the leg of the bird—a sure proof that no live specimen had, at that time, been brought to Holland.

* *Walgn.* to nauseate; *vogel*, a bird.

† *Wierachtigh Verhaal van de Schipvaart op Oot-Indiën, Ghedaen by de Acht Schepen in den Jare 1598.*

Passing over the visits to the isles of four old Dutch navigators, who all describe the dodo under different names, we come to the quaint old traveller, Sir Thomas Herbert, who touched at the Mauritius in 1627. In his *Relation of some Yeare's Travaille*, he thus describes the bird:—'The dodo; a bird the Dutch call walghvogel or dod eersen; her body is round and fat, which occasions the slow pace, or that her corpulencie; and so great as few of them weigh less than fifty pound: better to the eye than stomach: greasy appetites may perhaps commend them, but to the indifferently curious in nourishment, prove offensive. Let's take her picture: her visage darts forth melancholy, as if sensible of Nature's injurie in framing so great and massie a body to be directed by such small and complementall wings, as are unable to hoise her from the ground; serving only to prove her a bird, which otherwise might be doubted of. Her head is variously drest, the one-half hooded with downy blackish feathers; the other perfectly naked, of a whitish hue, as if a transparent lawne had covered it. Her bill is very hoked, and bends downwards; the thrill or breathing-place is in the midst of it, from which part to the end the colour is a light green mixed with a pale yellow; her eyes be round and small, and bright as diamonds; her clothing is of finest downe, such as you see on goslings. Her trayne is (like a China beard) of three or four short feathers; her legs thick, black, and strong; her tallons or pounces sharp; her stomach fiery hot, so as she easily can digest stones.'

As a 'China beard' consists of only a few hairs under the chin, the above simile is correct; but in the French edition of these travels, the translator erroneously rendered the words *oiseau de Chine*, Chinese bird, and subsequently, a celebrated French savant raised a magnificent hypothetical edifice on the basis of the mistranslation.

Herbert was the first who used the word dodo as the name of this bird, stating it to be derived from the Portuguese *doudo*, a simpleton; but as he is generally somewhat wild and vague in his etymologies, and as we have no intelligence whatever of the dodo through the Portuguese, we may safely conclude that the name is of Dutch derivation. In the old black-letter Dutch and English dictionary now before us, we find the word *dodoor* translated a humdrum, which, Dr Johnson tells us, means 'a stupid person.' Now, if the name be derived from the bird's simplicity, the Dutch *dodoor* is as near the mark as the Portuguese *doudo*. But it may be that the name was given on account of the peculiar form of the bird, and not in allusion to its mental capacity; and, consequently, even *dodoor* may not be the true origin. We more than suspect that it is really derived from a vulgar, compound epithet, used by Dutch seamen to denote an awkward, clumsily-formed, inactive person. This inquiry, however, is beyond our humble powers, and should be prosecuted by some learned professor—such, for instance, as Jonathan Oldbuck's friend, Dr Heavysterne, of the Low Countries.

We next hear of the dodo, in a curiously indirect manner, through an uneducated French adventurer named Cauche, who passed several years in Madagascar and the adjacent islands. His narrative, edited by one Morisot, an *avocat*, was published in 1651, and created great interest in France. In 1638, he was at the Mauritius, and there saw a bird which he describes under the name of the bird of Nazareth—*oiseau de Nazareth*—so termed, as he states, from its being found on the island of Nazareth, which lies to the northward of the Mauritius. The description is an accurate one of the dodo, with the exception of two particulars—one, as to the number and position of the toes; the other, as to the creature having no tongue—a prevalent opinion then amongst the vulgar with respect to several other birds. Though there is no record of this bird of Nazareth

having been seen by any one but Cauche, yet, ever since, his phantom-like picture has skulked in the obscurity, adding to the mystery which enveloped the dodo. Time, however, has now exorcised it. There never was a bird of Nazareth. What Cauche saw was undoubtedly a dodo; and his errors of description are what any person, not a naturalist, might commit. *Oiseau de Nazaret* is simply a corruption of *oiseau de nausée*—the original French name of the dodo, a literal translation of the original Dutch walghvogel. It is a curious coincidence, that as the bird of Nazareth has been found in books only, so the island of Nazareth has been found only on paper. At first, it appeared quite a respectable island; as maritime discovery progressed, it degenerated to a reef, and from that to a shoal; till at last, expunged from the more correct charts of modern hydrographers, it no longer can boast of a local habitation or a name.

About the same time that Cauche was at the Mauritius, the citizens of London were gratified by the sight of a living dodo. Of this very interesting event, there is only one solitary record at present known, but it is an authentic one. In a manuscript commentary on Sir Thomas Browne's *Vulgar Errors*—preserved in the British Museum—written by Sir Hamon L'Estrange, father of the more celebrated Sir Roger, there occurs the following passage:—

'About 1638, as I walked London streets, I [*] the picture of a strange fowle hung out upon a cloth [*] was, and myselfe, with one or two more then in company, went in to see it. It was kept in a chamber, and was somewhat bigger than the largest turkey-cock, and so legged and footed, but stouter and thicker, and of a more erect shape, coloured before like the breast of a young cock-fesan, and on the back of a dunne or deare colour. The keeper called it a dodo; and in the end of a chymney in the chamber there lay a heap of large pebble-stones, whereof hee gave it many in our sight, some as big as nutmegs; and the keeper told us shee eats them (conducting to digestion); and though I remember not how farr the keeper was questioned therein, yet I am confident that afterwards she cast them all againe.'

We next, in order of time, come to the famous Tradesant dodo. When or where the Tradesants procured it, is unknown; it is first mentioned in the catalogue of their museum, published by the surviving Tradesant, in 1656, as 'a dodar from the island Mauritius; it is not able to flie, being so big.' We shall presently have occasion to detail the subsequent history of this interesting specimen.

The last notice of the dodo's existence is found in a manuscript journal—in the Sloane Collection—kept by a 'Mr Ben. Harry,' who was chief officer of the English ship *Berkley Castle*, on a voyage to and from India in 1679. It appears that, the ship becoming leaky on their return voyage, they 'made for the Marushies,' where they repaired the vessel, and landed and dried the cargo. At this point of their proceedings, we shall let this intelligent mariner speak for himself: 'Now, having a little respite, I will make a little description of the island, first of its producks, then of its parts: first, of all winged and feathered fowle, the less passant are dodos, whose flesh is very hard. The Dutch, pleading a property in this island because of their settlement, have made us pay for goates one penny per pound.'

Though the Dutch did not form a regular settlement on the Mauritius till 1644, yet their vessels and those of other nations frequently called for supplies; and many persons—runaway seamen and others—lived on the island. It is not surprising that the awkward, slow-paced dodo, incapable of flight, and whose nest, as

* A hole is here burned in the manuscript, as if by the ash of a tobacco-pipe. At the first hiatus, the word wanting is, without doubt, *saw*; and at the second, the letters, *of can*.

we are told by Cauche, never contained more than one egg, became totally extinct soon after coming into contact with man. Nor would man alone be directly the dodo's destroyer; his immediate followers, the cat, hog, and dog, must have been fatal neighbours to its young. Leguat, a gentleman of education, spent several months on the Mauritius in 1693, but makes no mention of the dodo. He says: 'This island was formerly full of birds, but now they are becoming very scarce;' and further adds: 'Here are pigs of the China breed. These beasts do a great deal of damage to the inhabitants, by devouring all the young animals they can catch.' Less than a century, then, sufficed to extirpate the dodo. It was first seen in 1598—it was last noticed in 1679; and as Leguat, in 1693, does not mention it, we may conclude that it became extinct at some period between the last two dates. In 1712, the Dutch evacuated the Mauritius, and three years afterwards the French took possession, naming it *l'Île de France*. With this change of population, the very tradition of the dodo's existence on that island was completely lost.

The relics of the dodo, still left to admiring naturalists, are few, but, in a scientific view, very precious. They consist in all of a head and leg in the Ashmolean Museum at Oxford, a leg in the British Museum, and a head in the Royal Museum (*Kunst-Kammer*) at Copenhagen. The head and leg at Oxford are the sole remains of Tradescant's dodo. After the death of the last of that family, Ashmole obtained possession of their museum, which he subsequently presented to the University of Oxford. This dodo can be clearly traced to have been in the Ashmolean Museum until the year 1755, when, having been suffered to fall into decay, it was, by the order of the vice-chancellor of the university, and a majority of the visitors, condemned to be burned! For a long time after, the dodo was forgotten, or the fact of its once having existed was treated as a mere myth, till Dr Shaw, in 1793, rummaging among the refuse of the museum, rediscovered this identical head and leg. The question arises: How were these relics preserved? Did some university magnate desire their retention from the flames? Did some conservative curator slyly conceal them before the fatal mandate was executed? No! Even this paltry palliation must be refused to the learned Vandals. It is to Ashmole himself that science is indebted for these remains of the last specimen of a whole species. That litigious old Chancery lawyer, when he presented his museum to Oxford, did so under certain restrictions, which he drew up with his own hands, and which the university was bound to obey. One of these rules decrees, that any specimen in a bad condition should not be totally destroyed; but any hard parts, such as the head, horns, or feet, should be put away in a closet. This head is still in tolerable preservation. The singular form of the beak and nostrils, the bare skin of the face, combined with the partly feathered head, which the old writers compared to a hood, are still strikingly apparent. Of the history of the leg in the British Museum, little is known. It formerly belonged to the Royal Society, and is in all probability the same that is mentioned in the catalogue of a museum that was offered for sale in London by a person named Hubert, in 1664. It is certain that the leg at Oxford, and that at London, did not belong to the same bird; for though they are right and left, and their perfect agreement in character proves their identity of species, yet one is nearly an inch longer than the other. The head at Copenhagen was described by Olearius as early as 1666, in the catalogue of the museum of the Duke of Schleswig at Gottorf. In 1720, that museum was removed to Copenhagen, but it was not till within the last few years, when the history of the dodo excited so strongly the attention of naturalists, that this head was successfully sought for, and disinterred from a mass of rubbish, by Dr Reinhardt.

Many have been the conflicting opinions among naturalists with respect to the class of birds the dodo should be placed in. Space will not permit us to enter into these discussions. Suffice it to say, it is generally agreed now that the dodo was a gigantic, short-winged, fruit-eating pigeon. The English naturalist, Mr Strickland, who has devoted an amazing amount of labour and research to the elucidation of this mysterious question, and Dr Reinhardt of Copenhagen, were the first who referred the dodo to the pigeon tribe, having arrived almost simultaneously, by two distinct chains of reasoning, at the same conclusion; and their opinion is corroborated by a dissection that was lately made of part of the head at Oxford.

There can be no doubt that the dodo was one of those instances, well known to naturalists, of a species, or part of a species, remaining permanently in an undeveloped state. As the Greenland whale never acquires teeth, but remains a suckling all its life; as the proteus of the Carniolian caverns, and the axolotl of the Mexican lakes, never attain a higher form than that of the tadpole; so the dodo may be described as a permanent nestling covered with down, and possessing only the rudiments of tail and wings. Nor are we to consider such organisations as imperfect. Evidently intended for peculiar situations and habits of life, they are powerful evidences of the design displayed in the works of an All-wise Creator. Wandering about in the forests of the Mauritius, where, previous to the advent of man, it had not a single enemy, the dodo, revelling in the perpetual luxuriance of a tropical climate, subsisted on the nuts that fell from the surrounding trees. Its powerful bill enabled it to break, and its capacious, stone-supplied gizzard to digest, the hardest shells and kernels; and thus a kind of frugivorous vulture, it cleared away the decaying vegetable matter. In no other place than an island, uninhabited by man or any other animal of prey, could the helpless dodo have existed. Some fancy it may yet be found in Madagascar. Vain idea! Its carnivorous enemies among the lower animals, would have cut short the existence of the dodo, even if man had never planted his conquering footsteps upon that island.

MONOPOLIES.

IN the High Street of Edinburgh, not many doors further up than the premises of the publishers of this Journal, there is a curious memorial of an old and now generally abolished economic grievance. It is a portrait of a certain Dr Patrick Anderson, a physician of the reign of Charles I. It is an old portrait, or rather the representative of an old portrait, since it has necessarily been repainted from time to time, the atmosphere of Scotland not being favourable to the preservation of works of art in the open air. It serves as the sign of an ancient shop, where for generation after generation has been sold the medicine known as Anderson's Pills. What renders the portrait and the establishment with which it is connected so interesting to our present purpose is, that there is still an existing patent for the making and selling of Anderson's Pills. In whose hands it may now be, we are not aware; but we know that, ten years ago, the right of succession to this patent was the subject of a keenly-contested litigation. The question of course was—who was entitled to hold it, as representative of the physician of the reign of Charles I.? The event is suggestive of the effects that would arise from extending patents and copyrights over a great series of years, or to perpetuity, as some have considered desirable. If we suppose the pills to be a very great blessing, is not every human being as well

entitled, in justice and humanity, to have the benefit of them, as those who are fighting for the succession? What have they ever done to deserve a monopoly? If there were a perpetual copyright, who at the present day would be the representatives of Shakspeare or Milton; and what right would they have to reap great rewards from the riches with which the illustrious dead desired to endow all mankind? The inventors and authors themselves, it is true, deserve reward; and they obtain it in the shape of the limited monopoly. But the indefinite or very long continuance of this would only levy a tax to enrich those who have performed no service, and would fill the country with endless litigation. To return, however, to our special subject.

It may be a new thing to some of our readers, to hear of a patent more than two hundred years old. The cause of the anomaly is, that this exclusive privilege was granted before the present patent-law was extended to Scotland by the Union. Anderson called the pills *Grana Angelica*. He published an account of their astonishing virtues in a little Latin essay, which bears date 1685; and as it is believed that there are not more than three copies of this in existence, it is worth more than its weight in gold. He did not profess to be the inventor or discoverer of the medicine, but stated that he had found it in use at Venice.

Small as was thus the service for which Anderson and his posterity were endowed with a perpetual monopoly in these pills, it would have been well for the Stuart dynasty of kings if all monopolies granted by them had been as well deserved and as innocent. On the matter of monopolies, our ancestors had a hard struggle, and they acquitted themselves like men of sagacity and courage. The word monopoly is derived from the Greek. It means, sole-selling, and expresses itself at once. It is almost unnecessary at the present day to announce the law of political economy, that wherever a small number of individuals acquire the exclusive privilege of selling any commodity, or undertaking any particular kind of service, the public will be ill served. The price demanded will be high, and the commodity or the work will be bad in proportion. Thus much, indeed, of political economy our ancestors of the reign of King James knew. But it must be admitted, that they strangely confounded it with a totally different matter—with that forestalling of which we lately gave an account. The difference is, that in the one case there is the right to buy and sell as much of a commodity, or as little of it, as you please; and, in the other, the right to be the sole seller of the commodity. It is as great as the difference between freedom and slavery. No man can ever obtain a monopoly through money, unless it be by underselling all others; and that is a form in which it need not be grudged. However wide may be the field occupied by the forestaller, he cannot prevent others from competing with him, if he sell so dear that they can undersell him. The effect of an enforced monopoly is to drive competitors away, and give the monopolist the whole market on his own terms.

Many governments raise a revenue by granting monopolies. They levy a large sum from the individuals to whom they concede the privilege of selling or making certain articles. It need hardly be said, that it is a very costly revenue, causing much more loss to the people than the amount it brings to the public

purse; but it is a tempting resource, as it costs no trouble, and does not at least immediately bring the government to issue with the country. Queen Elizabeth did not overlook the convenience of this source of revenue. In fact, she pushed the system of monopolies very far, and nearly endangered the stability of her power. But she was a very wise ruler, and always stopped short at the point of endurance. Hallam gives the following animated account of a parliamentary contest in 1601. When we reflect on the departed corn-laws, the allusion to bread is certainly curious.

‘The grievance of monopolies had gone on continually increasing; scarce any article was exempt from these oppressive patents. When a list of them was read over in the House, a member exclaimed: “Is not bread among the number?” The House seemed amazed. “Nay,” said he, “if no remedy is found for them, bread will be there before the next parliament.” Every tongue seemed now unloosed, each as if emulously descanting on the injuries of the place he represented. It was vain for courtiers to withstand this torrent. Raleigh, no small gainer himself by some monopolies, after making what excuse he could, offered to give them up. Robert Cecil, the secretary, and Bacon, talked loudly of the prerogative, and endeavoured at least to persuade the House, that it would be fitter to proceed by petition to the queen than by a bill; but it was properly answered, that nothing had been gained by petitioning in the last parliament. After four days of eager debate, and more heat than had ever been witnessed, this ferment was suddenly appeased by one of those well-timed concessions by which skilful princes spare themselves the mortification of being overcome. Elizabeth sent down a message, that she would revoke all grants that should be found injurious by fair trial at law; and Cecil rendered the somewhat ambiguous generality of this expression more satisfactory by an assurance, that the existing patents should be repealed, and no more be granted.’

The speeches of the members are a very favourable specimen of the parliamentary oratory of Queen Elizabeth's reign, as may be seen from the following delivered by Mr Martin. He is no philosopher, it will be observed, in political economy, but speaks from the actual grievances witnessed by him. ‘I speak for a town that grieves and pines—for a country that groaneth and languisheth under the burden of monstrous and unconscionable substitutes to the monopolists [meaning sub-monopolists, who paid so much for enjoying the monopoly in a certain district] of starch, tin, fish, cloth, oil, vinegar, salt, and I know not what—nay, what not? The principal commodities both of my town and country are engrossed into the hands of those blood-suckers of the commonwealth. If a body, Mr Speaker, being let blood, be left still languishing without any remedy, how can the good estate of that body long remain? Such is the state of my town and country. The traffic is taken away. The inward and private commodities are taken away, and dare not be used without the licence of these monopolists. If these blood-suckers be still let alone to suck up the best and principal commodities which the earth hath given us, what shall become of us from whom the fruits of our own soil and the commodities of our own labour—which, with the sweat of our brows, even up to the knees in mire and dirt, we have laboured for—shall be taken by warrant of supreme authority which the poor subjects dare not gainsay?’ Another member, Sir Andrew Hobby, on the opposite side, started up, and said, ‘that betwixt Michaelmas and St Andrews tide, where salt before the patent was wont to be sold for 16d. a bushel, it is now sold for 14d. or 15d. a bushel.’*

The Stuart monarchs were not, as the world too well

knows, so wise as Queen Elizabeth. King James found the granting of monopolies a very convenient way of making a revenue. It saved him from coming in contact with a discontented parliament; and whatever heartburnings it might create, did not immediately affect his own royal comfort. Accordingly, he granted a number of monopolies both of necessities and luxuries. This created a system of the grossest oppression; since the great monopolists not only made as much as they could at the expense of the people, but sold portions of their monopolies to grasping, rapacious underlings, who conveyed the grievance into every corner of the land. These people became a hated and oppressive class, like the farmers of the revenue in France. According to a well-known anecdote, Voltaire, when in a company, each member of which had to tell some tragic story, was called upon in his turn. He said: 'There was once a farmer-general—you know the rest!' The same might have been said of the monopolists in the time of King James. One of them, indeed, has become in a manner illustrious in literature, by standing for the character of Sir Giles Overreach in the play of *A New Way to Pay Old Debts*. His prototype was Sir Giles Mompesson, a person whose oppressions created so much indignation, that parliament at last resolved to impeach him. In the proceedings, it was stated that Sir Giles, for the purpose of effectually carrying out his patent of monopoly, held the power of imprisoning those who infringed it, without judicial authority or the privilege of trial; and that he thus had many persons in private prisons—a proceeding ever justly odious in England, and contrary to the spirit of the constitution.

One of Sir Giles's monopolies related to the licensing of inns and the selling of horse-provender. Strangely enough, however, that monopoly which created the chief indignation was for the preparation and sale of gold and silver lace. He 'sophisticated' it, as the parliamentary documents call it—that is, he used base metal instead of bullion. One could imagine such a monopoly existing without the people being greatly oppressed by it. But gold and silver lace was much used by the aristocracy, and it seems probable that the indignation of parliament was considerably excited by feelings of a somewhat personal character. It is well known, that the person who chiefly supported these monopolies, and had the largest share of advantage from them, was the infamous favourite, the Duke of Buckingham. Instead of standing by his accomplice, however, he no sooner saw the wrath of parliament seriously and dangerously roused, than he gave up the monopolist as a victim. King James, too, who had bullied and insulted all who complained, seeing that parliament was in a truly formidable humour, went sneaking there, and boasted of having done his best to apprehend Sir Giles. 'For I do assure you,' he said, 'in the heart of an honest man, and on the faith of a Christian king, which both ye and all the world know me to be, had these things been complained of to me before the parliament, I would have done the office of a just king, and out of parliament have punished them as severely, and peradventure more, than ye now intend to do. But now that they are discovered to me in parliament, I shall be as ready in this way as I should have been in the other. For, I confess, I am ashamed—these things proving so as they are generally reported to be—that it was not my good-fortune to be the only author of the reformation and punishment of them, by some ordinary course of justice.'

Parliament, however, wisely kept the matter in its own hands, and immediately passed one of the most remarkable laws in the statute-book. This was no other than the act of 1623, establishing our system of patents for inventions. The original and main object of this act, was to take from the crown the power of granting monopolies. An exception was

introduced, which is supposed to be owing to the enlightened foresight of Bacon, authorising the crown to grant for a limited period monopolies to inventors.

This law did not extend to Scotland until the Union; and hence it is, that in the High Street we have at this day in existence a patent of the reign of Charles I.

A VENETIAN ADVENTURE OF YESTERDAY.

I was induced last summer to do rather a foolish thing for a middle-aged spinster—I undertook to chaperon a volatile young niece upon a continental tour. We travelled the usual course up the Rhine into Switzerland, which we enjoyed rapturously. Then passing the Alps, we spent a few days at Milan, and next proceeded to Verona. In all this journey, nothing occurred to mar our English frankness, or disturb our good-humour. We beheld, indeed, the subjection of the Lombardese people with pain. Still, it was no business of ours; and I may as well candidly state that, to the best of my recollection, we gave exceedingly little thought to the subject.

At Verona, the romance of Claudia's character found some scope. She raved at the so-called tomb of Juliet, was never tired of rambling among the ruins of the Roman amphitheatre, and made herself ill with the fresh figs and grapes presented in such abundance in the picturesque old market-place. I confess I should as soon have dreamed of danger from some ancient volcano of the Alps, as from the political system of the country which we were traversing. Indeed, it never could have occurred to us that a quiet lady of a certain age, and a young one just emancipated from frocks, were persons about whom a great empire could have been in any alarm. It was destined that we should find ourselves of much more consequence than we gave ourselves credit for.

On returning from our ramble, and entering the great *sala* of the *Due Torre*, I remember experiencing a slight sense of alarm at sight of the large proportion of Austrian officers amongst those sitting down to dinner. Still, as the feeling sprung from no definite cause, I readily gave up my wish for a separate dinner; and, yielding to the solicitations of an officious waiter, allowed myself and niece to take seats at table. My first feeling returned in some force when I saw a tall, bearded officer, after depositing his sword in a corner of the room, seat himself next to Claudia. A request on her part for the salt sufficed to open a conversation between them; but as it was in German, I could not follow its meaning. I observed, however, that it by and by waxed rather more warm than is customary in the languid hour of a *table-d'hôte*; and, what was more, a silence ensued amongst a considerable number of those within hearing, as if the subject of their conversation were of an interesting character. A kind-looking English gentleman on the opposite side of the table seemed to become uneasy, and he soon telegraphed to me with a look which I could not misunderstand. In real alarm, I touched Claudia's arm, and indicated my wish to retire. As soon as we reached our own apartment, I anxiously asked her what she had been saying, and what that animated conversation was about. 'Oh, nothing particular, Tantie dear. We were talking politics; but I am not a Republican, you know. You need not look afraid. I am a Royalist, and I told him so. Only, I said I thought it would be better for Italy to have an Italian king than an Austrian emperor. He did not seem to think so; but you know every one cannot think alike.'

'Oh, you unfortunate little girl!' I exclaimed; 'you little know the imprudence of which you have been guilty;' and I bitterly regretted my ignorance of German, which had allowed her to make such a demonstration of her sentiments. Still, she was but a child—what she had said was but a foolish sentiment. I

could scarcely, after all, think that any serious consequences would ensue from so simple a matter; nevertheless, I felt that the sooner we left Verona the better. We accordingly started next morning for Venice.

It was a most lovely day. The sun shone richly on the thousands of grape-bunches that hung on the vines, and on the wild-flowers that grew at their feet; and then the beautiful languid way in which the vines grow added another charm to the scene: apparently overcome by heat and lassitude, they throw themselves from one tree to another for their support, and hang between them in graceful festoons. We were not long, however, in the region of the green, and now slightly autumn-tinted leaves; our steam-engine seemed suddenly to have conceived the idea of drowning us, for we darted into the sea, and with nothing but water on either side, we appeared to be hurried on by some gigantic rope-dancer, so light was the bridge over which we were carried. Involuntarily, I seized hold of Claudia's arm; but gradually I saw in the distance so beautiful a thing—such a silent, white, fairy-like city, under such a brilliant sky, that I lost all earthly fear, and, in spite of the tangible railway carriage in which I was, I felt as if, like King Arthur, I was being borne by fairies to their fairy home.

At last we arrived, and entered by a long dusty passage the Dogana, in order to be examined. All romantic visions had now faded away: ordinary mortals were in attendance to look over our boxes; and it being the middle of a hot day, I began to feel both thirsty and tired, and most anxious to arrive quickly at the hotel, in order to secure comfortable apartments. Claudia stood for some time with the keys in her hand, vainly endeavouring to induce one of the custom-house officers to look at our boxes. The examination did not appear very strict, and we observed many of our fellow-passengers had their boxes just opened, and then were allowed to depart, with scarcely any delay. At last, one of the men approached us, and Claudia pointed to her open box, and asked him to examine it. The man looked up into her face—I thought, in a very scrutinising manner—then at the name on the box, and then retired, and whispered to one of his companions, who came back with him, and asked in Italian for our passport. This I immediately produced. They examined it, and said something to each other in German; upon which Claudia, who was more familiar with that language than with Italian, asked them in it to be kind enough to examine our boxes quickly, as her aunt was much tired. I saw the men exchange glances, and then they came forward to examine us. Being utterly unconscious of any necessity for concealment, we had left several English books at the very top of the box. These they carefully took out, and laid on one side, and then proceeded to rummage the boxes from top to bottom. By this time, as most of our fellow-passengers had been examined, and had proceeded to their hotels, I was getting fatigued and nervous, when it struck me that a small *douceur* would perhaps set matters right. This idea I communicated to Claudia, and she, speaking privately to a superior sort of man, who was overlooking the other, assured him that we were two perfectly unoffending English ladies travelling for pleasure, having nothing whatever to do with politics, and entreated him to let us go, at the same time putting some money in a hand conveniently placed for its reception. No sooner, however, had it been safely pocketed, than the man assured her that he could do nothing whatever for us, and that he must take some opportunity, when nobody was looking, of giving her back the money. It is needless to say, that this opportunity never arrived; and in the meantime, we were taken into a small room, to be more particularly examined.

Here another box was opened, when, to the great

vexation of my dear Claudia, her journal was found. Hitherto she had been very patient, but now she could bear it no longer. What! her journal, so carefully locked that nobody had ever been allowed to read it, to be at the mercy of these strange men! Claudia remonstrated loudly. 'They might have anything else they chose,' she said, 'but that she really could not give them.' She did not perceive that the more anxious she appeared about the book, the more important it seemed in their eyes, and the more anxious they, of course, were to retain it. After a long discussion, and many prayers and entreaties on Claudia's part, the books and papers were sealed up before us. They inquired what hotel we were going to, and told us we must call the next day for our books at a certain custom-house office they mentioned. Feeling harassed and persecuted, we proceeded to our hotel, my unhappiness being rendered more acute by our being separated from our *Murray*, without which I felt myself a perfectly helpless being, entirely at the mercy of any one who chose to impose upon me.

We obtained apartments at the hotel we intended lodging at, and as it was now late in the day, ordered our dinner, and retired early to rest, very anxious for the morrow, that we might know the fate of our books. Accordingly, the first thing we did the next day was to take a gondola, and proceed to the custom-house that had been mentioned to us. There, however, they knew nothing of our books. So we went to the British Consulate, to inform them of our case, and then returned to the hotel. During this voyage, I had several times observed a paper stuck against the walls, with *Notificazione* written in large letters on it, with some smaller printing beneath it. With a very uneasy heart, I asked Claudia to read it, and tell me what it meant. She did so, and found that it was informing the world in general, that two noble Italians were condemned, one to death, and the other to the galleys, for political offences. Of course, we were no judges of the rights of the case; but it is impossible not to feel one's heart saddened by the approaching death of a fellow-creature; besides which, my heart trembled for Claudia, and I conjured up to my mind the leaden-roof prisons; those beneath the ducal palace, those under water; the Bridge of Sighs; and that fearful part of the lagoon where no fishing was allowed, lest it should reveal some fearful secret, known only to the dead, and to certain minions of the dread Council. In vain I repeated to myself, that those days were past; in vain was it that Claudia laughed at my fears, and told me it was disgraceful for a British subject to feel them: still my heart felt heavy, and I shall not soon forget the anxiety of that hour.

We returned to the hotel, where we had not long been, when we were informed that a gentleman wished to speak to us. Fearful moment! I pictured to myself a ferocious-looking officer with a guard, like those who come upon the stage with Jaffier. Somewhat to my relief, the reality turned out to be of a gentler character. I found myself introduced to a polite-looking personage, who, however, speedily informed me, through the medium of the waiter—for we had no common language—that he did not want me, but a younger lady! O my poor Claudia! My heart beating violently, I returned to her, and informed her that she was wanted. Instead of being at all alarmed, she appeared rather gratified at finding herself of so much importance, and hastened to join the person who was waiting for her. He, in a very polite and respectful manner, told us that our books were at the police-office, and only awaited our arrival to be examined. Accordingly, we ordered a gondola, and accompanied him there. On the way, he took an opportunity of informing Claudia, that he was not what was called in England a policeman, but a gentleman, and that the person who would examine her was a count. Claudia replied rather haughtily, that she was an English lady, and had never

been examined by any one. At last we arrived, and proceeded to the apartment of the count; but what was my distress when I was informed that Claudia was to be examined alone! Claudia declared that she was a British subject, and that such a proceeding was an insult. I was almost in hysterics, and with tears entreated to be permitted to accompany my niece; but the obdurate though polite count was immovable. He merely said to Claudia: 'Madame, you have avowed that you have in your possession papers which have never been read by anybody but yourself; therefore you must be examined alone.' Further opposition was hopeless, so I returned disconsolate to my gondola, to await the issue.

When Claudia was left alone with the count, he shewed her a paper in which he was officially informed, that a lady of her name and appearance was coming to Venice, who was suspected of being a dangerous political character. To hear such a character attributed to her—to her, who was only last year boarding in a school—to her, who knew little more of politics than that Queen Victoria and Prince Albert were the most amiable young couple in England—was ludicrous even in that hour of trouble. I do not exactly know how she comforted herself during her examination; but I suspect she not merely laughed at the whole affair, but felt a little elated at the idea of being held as of so much importance. She was really anxious, however, about her journal and writing-case, as they contained so many things 'of no importance to any but the owner.' When the count informed her, that the journal and papers must, in the first place, be subjected to translation, she could set no bounds to her vexation; and yet the thing had its ridiculous aspect also. She had been pretty free, in the journal, with her criticisms on the Austrian army, though only with regard to the appearance and manners of the officers. How they were to take her remarks on their moustaches, their everlasting smoking, and their almost as constant perseverance in *dining*, was not to be conceived. Then her papers—scraps of paper on which she had tried rhymes, such as love, dove; heart, part; fame, name; with a view to embodiment in her poems—letters from young friends, telling all about the parties of their respective mammas, and how interesting the last baby was: to think of these being subjected to the rigid scrutiny of a council of either Ten or Three, was too whimsical. To the count, on the other hand, everything was grave and official. He said he could well believe, that she was innocent of all that had been imputed to her; still, his instructions must be obeyed. He could not promise the restoration of her papers in less than ten days. At the end of the examination, he courteously dismissed her, but not without letting her know, that she and her companion would be under the surveillance of the police till the papers were fully examined.

My light-hearted niece returned to me with an air of importance quite new to her, and which did not abate till she observed how exceedingly I had suffered during our separation. I felt reassured on learning that everything depended on the examination of the papers, as I had no doubt they were of a sufficiently innocent character. The shock, however, had been enough to mar my power of enjoying Venice. We did, indeed, go about to see the usual sights; and even the shadow-like attendance of the policeman ceased at length to give us much annoyance. But I saw everything through an unpleasant medium, and heartily wished myself out of a region where the government of pure force seems the only one attainable. At the end of a fortnight, we received back our papers, with many apologies for their detention, and for the scrutiny to which we had been exposed; which, however, it too truly appeared, had been brought upon us by that one incautious expression of Claudia at Verona. Very soon after, we

left Venice, and regained the safe shores of England with little further adventure.

[Note.—Let no one suppose that this is in any degree an exaggeration of the present state of things in Venice. Only about a month after the adventure of the two ladies, two individuals of that city were condemned for having been in correspondence with political exiles. One, a nobleman, had his sentence commuted to the galleys, at the intercession of a Spanish princess, daughter of Don Carlos; the other, a bookseller in the Piazza di San Marco, was hanged on the morning of Saturday the 11th October, during the whole of which day his body was exposed to the public gaze. The walls were next day found extensively inscribed with, 'Venetians! remember the murder of yesterday, and revenge it!'—*Ed.*

STUDENT-LIFE AT CAMBRIDGE.

Most Englishmen know as much about Timbuctoo or Patagonia as they either know or care to know about Oxford or Cambridge. Those, however, who have the curiosity to include such subjects in their knowledge of 'foreign parts,' will find a very pleasant guide to an acquaintance with the geography, language, laws, manners, and customs of Cambridge, in a work recently published by an American student,* who some years ago transferred his studies from Yale College to that university.

In describing Cambridge, Mr Bristed asks his readers to imagine the most irregular town that can be imagined—streets of the very crookedest kind, houses low and antique, with their upper storeys sometimes projecting into the narrow pathway, which leads the bewildered stranger every now and then over a muddy little river, winding through the town in all sorts of ways, so that in whatever direction he walks from any point, he is always sure before long to come to a bridge. Such is the town of Cambridge—the bridge over the *Cam*. And among these narrow, ugly, dirty streets, are tumbled in, as it were at random, some of the most beautiful academical buildings in the world.

It was in the October of 1840, that our young New-Yorker first wended his way through these narrow streets, and gazed upon these beautiful buildings. The idea of an educational institution scattered over an area of some miles, was new to the late inhabitant of the brick barn cylept Yale College. The monkish appearance of the population was no less novel, while his own appearance caused the gownsmen to retaliate his curiosity. He was dressed, he tells us, in the 'last Gothamite fashion, with the usual accessories of gold chain and diamond pin, the whole surmounted by a blue cloth cloak'—a costume which drew down upon him a formidable array of eye-glasses.

Mr Bristed entered Trinity College as a fellow-commoner. The fellow-commoners are 'young men of fortune,' who, in consideration of paying twice as much for everything as anybody else, are allowed the privilege of sitting at the fellows' table in hall, and in their seats at chapel; of wearing a gown with gold or silver lace, and a velvet cap with a metallic tassel; and of getting off with a less number of 'chapelets' per week. The main body of the students are called pensioners. The sizars are an inferior class, who receive alms from the college, and dine gratis after the fellows (*sic*), on the remains of their table.

* *Five Years at an English University.* By C. A. Bristed. 2 vols. New York: 1852.

When one 'goes up,' as the phrase is, to the university, the first academical authority he makes acquaintance with in the regular order of things, is the college tutor. Besides lecturing, this functionary is the medium of all the students' pecuniary relations with the college. He sends in their accounts every term, and receives the money through his banker; nay, more, he takes in their tradesmen's bills, and settles them also. The tutor is supposed to stand *in loco parentis*. Some colleges have one, others two, and even three tutors, according to the size. The first thing, is to be examined; and this over, the freshman is first inducted into his rooms by a *gyp* (from γῦψ, a vulture!), who acts as *funkey* to a dozen or twenty students—calling them in the morning, brushing their clothes, carrying parcels and the queerly-twisted notes they are constantly writing to each other, waiting at their parties, and so on. 'Boots' is a subordinate functionary. The furniture of the room is generally taken from the former occupant at a valuation by the college upholsterer. Crockery he has always to find for himself; but in this matter, again, he has the college authorities to assist him in getting a good article.

We shall now accompany the student through a day's history. Morning chapel begins at seven; and the *gyp* calls him at half-past six. In chapel, he commences picking up some knowledge of the powers that be, or the *docs*, as they are styled in the slang of the university. In general terms, they are the *master* and *fellows*.

The master, or 'head of the house,' is the supreme ruler within the college walls, and moves about like an undergraduate's deity. The fellows, who form the general body from which the other college-officers are chosen, are the aggregate of those four or five bachelor scholars per annum, who pass the best examination in classics, mathematics, and metaphysics. The eight oldest fellows at any time in residence, together with the master, have the government of the college vested in them. The *dean* is the presiding officer in chapel: his business is to pull up the absentees—no sinecure, it is said. Even the scholars, who are literally paid for going, every chapel being directly worth two shillings sterling to them, give the dean a good deal of trouble. Other officers are the *vice-master*, the *bursar* or treasurer, lecturers, assistant-lecturers, assistant-tutors, four chaplains, and the librarian. Prayers last half an hour; after which the student walks in the college grounds, and by 8, he is seated by his comfortable fire over his hot rolls and tea. At 9, lectures begin, and continue till 12, some ten or eleven going on at once, and each occupying an hour. A little before 1, the student resorts to his private tutor, or *coach*, as the cantabs call him. He generally takes five or six pupils a day, giving an hour to each. The coach is indispensable to a student; and 'a good coach' is always in great requisition. His intercourse with his pupils is of the most familiar character; nevertheless, he must drive his team well, or he would lose his reputation. From 2 till 4 is the traditional time of exercise, the most usual modes of which are walking (constitutionalising is the cantab for it) and rowing. Cricketing, and all games of ball, are much practised in their respective seasons. Towards 4 p.m., they begin to flock in for dinner. A Latin grace is read by two of the *docs*, and forthwith the demolition of estates proceeds. Though there is a common hall, there is no common table. On the contrary, there is no end to the variety, both as respects rank, provision, and privilege. Hall lasts about three-quarters of an hour. Two scholars conclude the business by reading a long Latin grace—the *docs*, it is said, being too full after dinner for such duty. After hall is emphatically lounging-time. Some stroll in the grounds; many betake themselves to the reading-room; and many assemble at wine-parties, to exchange the gossip of the day. At

6 p.m., the chapel-bell rings again, when the muster is better than in the morning. After chapel, the evening reading begins in earnest. Most of the cantabs are late readers, always endeavouring to secure several hours' consecutive work, their only intermission being to take a cup or two of tea by way of stimulus. One solid meal a day is the rule: even when they go out to sup, as a reading-man does perhaps once a term, and a rowing-man twice a week, they eat very moderately, though the same cannot always be said of their potatoes. Such is the reading-man's day—now for the boating-man's.

Boating is the university amusement, *par excellence*. The expense of it is small, and the Cam so convenient—just behind the colleges. At all times of the year you may see solitary men in wherries; while the boat-clubs for the formal spring-races are a convenient outlet for college emulation—the 'top of the river' being an honour hardly inferior to the senior wranglership. Each college has at least one boat-club; and about nine races take place in the season. They have an annual match with Oxford, in which they are generally victorious, for the cantabs are reckoned to be the best smooth-water 'oars' in England, if not in the world. The Cam not being much wider than a canal, it is impossible for the boats to race side by side. They are, therefore, drawn up in a line, two lengths between each, and the contest consists in each boat endeavouring to touch with its bow the stern of the one before it, which operation is called *bumping*; and at the next race, the *bumper* takes the place of the *bumped*. To-day, there is to be a race; and the gowsmen—not in their gowns—are hurrying down to the scene of action, distant two miles from the town. Bang! There goes the first gun! In three minutes, there will be another; and in two more, a third; and then for it! We are at the upper end of 'the Long Reach,' where we have a good view. The eight stalwart Caius-men bend to their oars the moment they see the last gun flash. On they come at a good rate, the Caius-men, who are first, taking it quite easy, when suddenly there is a shout: 'Trinity! Trinity! Go it, Trinity!' Trinity is now overhauling Caius at every stroke; and the partisans of the respective boats fill the air with their shouts. 'Now, Keys (Caius)!' 'Now, Trinity!' 'Why don't you pull, Keys?' 'Now you have 'em, Trinity!' 'Keys!' 'Trinity!' 'Now's your chance, Keys!' 'Pull, Trinity!' 'Pull, Keys!' 'Hurrah, Trinity! inity! inity!' Not more than half a foot intervenes between the pursuer and the pursued, still Caius pulls with all his might; for boats occasionally run a mile almost touching. But there is no more chance. One tremendous pull from Trinity, and half that distance has disappeared. Another such stroke, and you are aboard of them. Hurrah! a bump—a bump! Not so. Caius is on the look-out; and with a skilful inclination of the rudder, the steersman makes his boat fall off—just the least bit in the world, but enough—Trinity overlaps, but does not touch. Another moment, and Trinity is head of the river.

The staple exercise, however, is walking. Between 2 and 4, all the roads in the neighbourhood of Cambridge are covered with men taking their constitutionals. Longer walks, of twelve or fifteen miles, are frequently taken on Sundays. There is not so much riding as might be supposed. When there is ice enough, the cantabs are great skaters. It is almost a *sine qua non* that their exercise should be in the open air. A finer set of men, consequently, is not to be seen. So bent, indeed, are they upon combining study and recreation, that, during the vacations, they form excursion-parties, which, from their professed design, are called *reading-parties* (*lucus a non lucendo*), and of which the utmost that can be advanced in justification of their name is, that reading is *not impossible*. Reading-parties do not confine themselves to England, or even the United Kingdom; sometimes they go as far as

Dresden. When a crack tutor goes on one, which is not often, he takes his whole team with him.

Debating-clubs do not seem to be so common at the English universities as at the Scotch. At Cambridge, there is only one of a public nature—the 'Union.' Henry F. Hallam was instrumental in getting up a small society of about forty members, called the 'Historical.' Another society of a private nature was composed of a number of intellectual aspirants, called the 'Cambridge Apostles;' so called, it is said, because they had usually thirteen members in residence. This was a university feeder to the Metropolitan Club, founded by the friends of John Sterling. Their association had great influence in the formation of their minds and characters—a sort of mutual benefit society in more respects than one. For example, when a member of the club publishes a book, one of the fraternity has a footing in the *Edinburgh*, another in the *Quarterly*, a third in *Fraser*, and a fourth in *Blackwood*, and so the new work is well introduced. Both Tennyson and Thackeray, it is said, got well taken notice of in this way by their comrades. But there was no plan at the bottom of it—nothing to constitute them a name. The Apostles were always inveighing against cant—always affecting much earnestness, and a hearty dislike of formalism, which rendered them far from popular with the *high* and *dry* in literature, politics, or religion. They were eyed with terror by the conservatives as something foreign—German, radical, altogether monstrous. But, in reality, their objects were literary—not religious; and religion only entered into their discussions as it must into those of all serious and philosophic men.

Upon the whole, our young American was much pleased with Cambridge, and much benefited during his residence there. Genial himself, he found Englishmen the same; and though he had his eyes open, while in this country, and never forgot that he was an American, he writes with great impartiality, which raises the value of his intense enthusiasm for the English and English life. After five years' residence, he took leave of his friends in a series of substantial dinners, that there might be a pleasant memory of the transatlantic in their mouths. On a fine May morning, he took his last walk in the beautiful grounds of Trinity, and set out for New York, where he now leads a classical existence, puzzling the natives by his free use of the Græco-cantab dialect, as well as by a semi-pagan sort of worship which he pays to his *Alma Mater*.

DREAMS.

Dreams usually take place in a single instant, notwithstanding the length of time they seem to occupy. They are, in fact, slight mental sensations, unregulated by consciousness; these sensations being less or more intense, painful or agreeable, according to certain physical conditions. On this subject, the following observations occur in Dr Winslow's *Psychological Journal*:—'We have in dreams no true perception of the lapse of time—a strange property of mind! for if such be also its property when entered into the eternal disembodied state, time will appear to us eternity. The relations of space, as well as of time, are also annihilated; so that while almost an eternity is compressed into a moment, infinite space is traversed more swiftly than by real thought. There are numerous illustrations of this principle on record. A gentleman dreamed that he had enlisted as a soldier, joined his regiment, deserted, was apprehended, carried back, tried, condemned to be shot, and at last led out for execution. After all the usual preparations, a gun was fired; he awoke with the report, and found that a noise in the adjoining room had, at the same moment, produced the dream, and awakened him. A friend of Dr Abercrombie dreamed that he had crossed the Atlantic, and spent a fortnight in America. In embarking, on his return, he fell into the sea, and awakening in the fright, found that he had not been asleep ten minutes.'

A WIND-STORM AT NIGHT.

O sudden blast, that through night's silence black
Sweep'st past my windows,
Coming and going with invisible track—
As death or sin does—

Why scare me, lying sick, and—save thine own—
Hearing no voices?
Why mingle with a helpless human moan
Thy fierce rejoices?

Thou shouldst come gently, as good angels come
To souls departing;
Floating among the shadows of the room
With eyes light-darting:

Bringing faint airs of balm, and tones that rouse
Thoughts of a Far Land;
Binding so softly upon aching brows
Death's poppy-garland.

O fearful blast, I shudder at thy sound;
Like some poor mortal
Who hears the Throe that mark life's doomed bound
Sit at his portal.

Thy wings seem laden with sad, shrieking souls,
Borne, all unwilling,
From earth's known plains, to the unknown gulf that
rolls,
Evermore filling.

Fierce wind! wilt the Death-Angel come like thee,
And swiftly bear me—
Whither?—What mysteries may unfold to me?
What horrors scare me?

Shall I go wandering on through silent space,
Lonely—still lonely?
Or seek through myriad spirit-ranks one face,
And miss that only?

Shall I not then drop down from sphere to sphere,
Falsied and aimless?
Or will my being new so changed appear
That grief dies nameless?

Rather, I pray Him who Himself is Love,
Out of whose essence
All pure souls spring, and towards Him tending, move
Back to His presence—

His light transfiguring, may not efface
The soul's earth-features,
That the dear human likeness each may trace—
Glorified creatures:

That we may love each other, only taught
Holier desiring;
And seek all wisdom, as on earth we sought,
Ever aspiring:

That we may do all work we left undone
Through frail unmetness;
From sphere to sphere together passing on
Towards full completeness.

Then, strong Azrael, be thy solemn call
Soft as spring-breezes,
Or like this blast, whose loud fiend-festival
My heart's pulse freezes—

I will not fear thee!—If thou safely keep
My soul, God's giving,
And my soul's soul—I, wakening from death's sleep,
Shall first know living.

Printed and Published by W. and R. CHAMBERS, High Street, Edinburgh. Also sold by W. S. ORR, Amen Corner, London; L. N. CHAMBERS, 55 West Nile Street, Glasgow; and J. M'GLASHAN, 50 Upper Sackville Street, Dublin.—Advertisements for Monthly Parts are requested to be sent to MAXWELL & Co., 31 Nicholas Lane, Lombard Street, London, to whom all applications respecting their insertion must be made.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 441. NEW SERIES.

SATURDAY, JUNE 12, 1852.

PRICE 1½d.

UNFASHIONABLE CLUBS.

It is with a feeling doubtless somewhat analogous to that of the angler, that the London shopkeeper from time to time regards the moneyless crowds who throng in gaping admiration around the tempting display he makes in his window. His admirers and the fish, however, are in different circumstances: the one won't bite if they have no mind; the others can't bite if they should have all the mind in the world. Yet the shopkeeper manages better than the angler; for while the fish are deaf to the charming of the latter, charm he never so wisely, the former is able, at a certain season of the year, to convert the moneyless gazers into ready-money customers. This he does by the force of logic. 'You are thinking of Christmas,' says he—'yes, you are; and you long to have a plum-pudding for that day—don't deny it. Well, but you can't have it, think as much as you will; it is impossible as you manage at present. But I'll tell you how to get the better of the impossibility. In twenty weeks, we shall have Christmas here: now if, instead of spending every week all you earn, you will hand me over sixpence or a shilling out of your wages, I'll take care of it for you, since you can't take care of it for yourself; and you shall have the full value out of my shop any time in Christmas-week, and be as merry as you like, and none the poorer.'

This logic is irresistible. Tomkins banks his 6d. for a plum-pudding and the etceteras with Mr Allspice the grocer; and this identical pudding he enjoys the pleasure of eating half-a-dozen times over in imagination before the next instalment is due. He at length becomes so fond of the flavour, that he actually—we know, for we have seen him do it—he actually, to use his own expression, 'goes in for a goose' besides with Mr Pluck the poulterer. Having once passed the Rubicon, of course he cannot go back; the weekly sixpences must be paid, come what will: it would be disgraceful to be a defaulter. So he practises a little self-denial, for the sake of a little self-esteem—and the goose and pudding in perspective. He finds, to his astonishment, that he can do quite as much work with one pot of beer a day as he could with two, and he drops the superfluous pot, and not only pays his instalments to the Christmas-bank, but gets a spare shilling in his pocket besides. Thus, under the tuition of the shopkeeper, he learns the practice of prudence in provisioning his family with plum-pudding, and imbibes the first and foremost of the household virtues, on the same principle as a wayward child imbibes physic—out of regard to the dainty morsel that is to come afterwards.

Passing one day last autumn through a long and populous thoroughfare on the southern side of the Thames, we happened to light upon Mr Allspice's appeal to the consciences and the pockets of the pudding-eating public. 'If you are wise,' said the admonitory placard, 'you will lose no time in joining Allspice's Plum-pudding Club.' Remembering the retort of a celebrated quack: 'Give me all the fools that come this way for my customers, and you are welcome to the wise men,' we must own we felt rather doubtful of the prosperity of the puddings; but having an interest in the matter, we resolved, notwithstanding, to ascertain, if possible, whether the Wisdom who uttereth her voice in the streets had on this special occasion spoken to any purpose, and whether any, and how many, had proved themselves wise in the acceptance of Mr Allspice. On making the necessary inquiries after the affair had gone off, we learned, to our surprise and gratification, that the club had been entirely successful. Upwards of a hundred persons of a class who are never worth half-a-crown at a time, had subscribed 6d. a week each for eighteen weeks, and thus entitled themselves to 9s. worth of plum-pudding ingredients, besides a certain quantity of tea and sugar. Thus the club had prospered exceedingly, and had been the instrument of introducing comfort and festive enjoyment to no small number of persons who might, and in all probability would, have had little to eat or drink, and, consequently, little cause for merriment, at that season. This is really a very pleasant fact to contemplate, connected though it be with a somewhat ludicrous kind of ingenuity, which must be exercised in order to bring it about. To anybody but a London shopkeeper, the attempt would appear altogether hopeless, to transform a hundred poor persons, who were never worth half-a-crown a piece from one year's end to the other, into so many 9s. customers; and yet the thing is done, and done, too, by the London grocer in a manner highly satisfactory, and still more advantageous to his customers. Is it too much to imagine that the lesson of provident forethought thus agreeably learned by multitudes of the struggling classes—for these clubs abound everywhere in London, and their members must be legion—have a moral effect upon at least a considerable portion of them? If one man finds a hundred needy customers wise enough to relish a plum-pudding of their own providing, surely they will not *all* be such fools as to repudiate the practice of that very prudence which procured them the enjoyment, and brought mirth and gladness to their firesides! Never think it! They shall go on to improve, take our word for it; and having learned prudence from plum-pudding, and generosity from goose—for your

poor man is always the first to give a slice or two of the breast, when he has it, to a sick neighbour—they shall learn temperance from tea, and abstinence, if they choose, from coffee, and ever so many other good qualities from ever so many other good things; and from having been wise enough to join the grocer's Plum-pudding Club, they shall end by becoming prosperous enough to join the Whittington Club, or the Gresham Club, or the Athenæum Club, or the Travelers' Club; or the House of Commons, or the House of Lords either, for all that you, or we, or anybody else, can say or do to the contrary.

We know nothing of the original genius who first hit upon this mode of indoctrinating the lower orders in a way so much to their advantage; we hope, however, as there is little reason to doubt, that he found his own account in it, and reaped his well-deserved reward. Whoever he was, his example has been well followed for many years past. In the poorer and more populous districts of the metropolis, this practice of making provision for inevitable wants, by small subscriptions paid in advance, prevails to a large extent. As winter sets in, almost every provision-dealer, and other traders as well, proffers a compact to the public, which he calls a club, though it is more of the nature of a savings-bank, seeing that, at the expiration of the subscribing period, every member is a creditor of the shop to the amount of his own investments, and nothing more. Thus, besides the Plum-pudding Clubs, there are Coal Clubs, by which the poor man who invests 1s. a week for five or six of the summer months, gets a ton of good coal laid in for the winter's consumption before the frost sets in and the coal becomes dear. Then there is the Goose Club, which the wiser members manage among themselves by contracting with a country dealer, and thus avoid the tipsy consummation of the public-house, where these clubs have mostly taken shelter. Again, there is the Twelfth-cake Club, which comes to a head soon after Christmas, and is more of a lottery than a club, inasmuch as the large cakes are raffled for, and the losers, if they get anything, get but a big bun for their pains and penalties. All these clubs, it will be observed, are plants of winter-growth, or at least of winter-fruiting, having for their object the provision of something desirable or indispensable in the winter season. There is, however, another and a very different species of club, infinitely more popular than any of the above, the operations of which are abundantly visible throughout the warm and pleasant months of summer, and which may be, and sometimes is, called the Excursion Club.

The Excursion Club is a provision which the working and labouring classes of London have got up for themselves, to enable them to enjoy, at a charge available to their scanty means, the exciting pleasures—which are as necessary as food or raiment to their health and comfort—of a change of air and scene. It is managed in a simple way. The foreman of a workshop, or the father of a family in some confined court, or perhaps some manageress of a troop of working-girls, contracts with the owner of a van for the hire of his vehicle and the services of a driver for a certain day. More frequently still, the owner of the van is the prime mover in the business, but then the trip is not so cheap. The members club their funds, the men paying 1s. each, the wives, 6d., the children, 3d. or 4d.; and any poor little ragged orphan urchin, who may be hanging about

the workshop, gets accommodated with a borrowed jacket and trousers, and a gratuitous face-washing from Mrs Grundy, and is taken for nothing, and well fed into the bargain. The cost, something over a guinea, is easily made up, and if any surplus remains, why, then, they hire a fiddler to go along with them. On the appointed morning, at an early hour, rain or shine, they flock to the rendezvous to the number of forty or fifty—ten or a dozen more or less is a trifle not worth mentioning. Each one carries his own provisions, and loaded with baskets, cans, bottles, and earthen-jars, mugs and tea-kettles, in they bundle, and off they jog—pans rattling, women chattering, kettles clinking, children crowding, fiddle scraping, and men smoking—at the rate of six or seven miles an hour, to Hampton Court or Epping Forest. It is impossible for a person who has never witnessed these excursions in the height of summer, to form an adequate notion of the merry and exciting nature of the relaxation they afford to a truly prodigious number of the hard-working classes. Returning from Kingston to London one fine Monday morning in June last, we met a train of these laughter-loaded vans, measuring a full mile in length, and which must have consisted of threescore or more vehicles, most of them provided with music of some sort, and adorned with flowers and green boughs. As they shot one at a time past the omnibus on which we sat, we were saluted by successive volleys of mingled mirth and music, and by such constellations of merry-faced mortals in St Monday garb, as would have made a sunshine under the blackest sky that ever gloomed. Arrived at Hampton Court, the separate parties encamp under the trees in Bushy Park, where they amuse themselves the livelong day in innocent sports, for which your Londoner has at bottom a most unequivocal and hearty relish. They will most likely spend a few hours in wandering through the picture-galleries in the palace, then take a stroll in the exquisite gardens, where the young fellow who is thoughtless enough to pluck a flower for his sweetheart, is instantly and infallibly condemned to drag a heavy iron roller up and down the gravel-walk, to the amusement of a thousand or two of grinning spectators. Having seen the palace and the gardens, they pay a short visit, perhaps, to the monster grape-vine, with its myriads of clusters of grapes, all of which Her Gracious Majesty is supposed to devour; and then they return to their dinner beneath some giant chestnut-tree in the park. The cloth is spread at the foot of the huge trunk; the gashed joints of the Sunday's baked meats, flanked by a very mountainous gooseberry pie, with crusty loaves and sections of cheese and pats of butter, cut a capital figure among the heterogeneous contribution of pitchers, preserve-jars, tin-cans, mugs and jugs, shankless rummers and wine-glasses, and knives and forks of every size and pattern, from the balance handles and straight blades of to-day, to the wooden haft and curly-nosed cimeter of a century back. Their sharpened appetites make short work of the cold meats and pies. Treble X of somebody's own corking fizzes forth from brown jar and black bottle, and if more is wanted, it is fetched from the neighbouring tavern. Dinner done, the fiddle strikes up, and a dance on the greensward by the young people, while the old ones, stretched under the trees, enjoy a quiet gossip and a refreshing pipe, fills up the afternoon. There is always somebody at this crisis who is neither.

too old to dance nor too young to smoke a gossiping pipe, and so he does both at intervals—rushing now into the dance, drawn by the irresistible attraction of the fiddle, and now sidling back again to his smoke-puffing chums, impelled by the equally resistless charms of tobacco. Then and therefore he is branded as a deserter, and a file of young lasses lay hands on him, and drag him forth in custody to the dance; and after a good scolding from laughing lips, and a good drubbing from white handkerchiefs, they compromise the business at last by allowing him to dance with his pipe in his mouth.

By five o'clock, Mrs Grundy has managed, with the connivance of Jack the driver, somehow or other to boil the kettle, and a cup of tea is ready for all who are inclined to partake. The young folks for the most part prefer the dance: they can have tea any day—they will not dance on the grass again till next year perhaps; so they make the most of their time. By and by, the fiddler's elbow refuses to wag any longer: he is perfectly willing himself, as he says, 'to play till all's blue; but you see,' he adds, 'bones won't do it.' 'Never mind,' says the Beau Nash of the day: 'sack your badger, old boy, and go and get some resin. Now, then, for kiss in the ring!' Then while the fiddler gets his resin, which means anything he likes to eat or drink, the whole party, perhaps amounting to three or four van-loads in all, form into a circle for 'kiss in the ring.' The ring is one uproarious round of frolic and laughter, which would 'hold both its sides,' but that it is forced to hold its neighbours' hands with both its own, under which the flying damsel who has to be caught and kissed bobs in and out, doubling like a hare, till she is out of breath, and is overtaken at last, and led bashfully into the centre of the group, to suffer the awful penalty of the law. While this popular pastime is prolonged to the last moment, the van is getting ready to return; the old folks assist in stowing away the empty baskets and vessels; and an hour or so before sun-down, or it may be half an hour after, the whole party are remounted, and on their way home again, where they arrive, after a jovial ride, weary with enjoyment, and with matter to talk about for a month to come.

At Epping Forest, the scene is very different, but not a whit the less lively. There are no picture-galleries or pleasure-gardens, but there is the Forest to roam in, full of noble trees, in endless sinuous avenues, crowned with the 'scarce intruding sky,' among which the joyous holiday-makers form a finer picture than was ever painted yet. Then there are friendly foot-races and jumping-matches, and leap-frogging, and black-berrying, and foot-balling, and hockey-and-trapping, and many other games besides, in addition to the dancing and the ring-kissing. Epping and Hainault Forests are essentially the lungs of Whitechapel and Spitalfields. Their leafy shades are invaded all the summer long by the van-borne hosts of laborious poverty. Clubs, whose members invest but a penny a week, start into existence as soon as the leaves begin to sprout in the spring; with the first gush of summer, the living tide begins to flow into the cool bosom of the forest; and until late in the autumn, unless the weather is prematurely wintry, there is no pause for a day or an hour of sunshine in the rush of health-seekers to the green shades. The flat has gone forth from the government for the destruction of these forests, for the felling of the trees and the enclosure of the land. Will the public permit the execution of the barbarous decree? We trust not.

Notwithstanding all that has been said, and so justly said, of the notorious improvidence of the poor, it will be seen from the above hasty sketches, that they yet can and do help themselves to many things which are undeniably profitable and advantageous to them: they only want, in fact, a motive for so doing—a foregone

conviction that the thing desiderated is worth having. Now, here is ground for hope—an opening, so to speak, for the point of the wedge. That the very poor may be taught to practise self-denial, in the prospect of a future benefit, these clubs have proved; and we may confess to a prejudice in their favour, not merely from what they have accomplished, but from a not unreasonable hope, that they may perchance foster a habit which will lead to far better things than even warm chimney-corners, greenwood holidays, roast geese, and plum-pudding.

ARAGO ON THE SUN.

IN the *Annuaire of the Bureau des Longitudes*, recently published in Paris, appears a paper by the distinguished astronomer Arago—'On the Observations which have made known the Physical Constitution of the Sun and of different Stars; and an Inquiry into the Conjectures of the Ancient Philosophers, and of the Positive Ideas of Modern Astronomers on the Place that the Sun ought to occupy among the Prodigious Number of Stars which stud the Firmament'—in which all that appertains to the subject is so ably condensed, as to afford material for a popular summary, which we purpose to convey in the present article. The eclipse of the sun of last July, by enabling observers to repeat former observations and test their accuracy, furnished some of the results which serve to complete the paper in question, and which may be considered as settled, owing to the improvements continually taking place in the construction of instruments. Although astronomy is the exactest of sciences, its problems are not yet all fully solved; and for the determination of some of these, observers have to wait for years—in certain instances, for a century or more, until all the circumstances combine for a favourable observation. From the days of the Epicurean philosopher, who, judging from appearances, declared the sun to be no more than a foot in diameter, to those of living calculators, who give to the orb a diameter of 883,000 miles, there has been a marvellous advance. In these dimensions, we have a sphere one million four hundred thousand times larger than the earth. 'Numbers so enormous,' says M. Arago, 'not being often employed in ordinary life, and giving us no very precise idea of the magnitudes which they imply, I recall here a remark that will convey a better understanding of the immensity of the solar volume. If we imagine the centre of the sun to coincide with that of the earth, its surface would not only reach the region in which the moon revolves, but would extend nearly as far again beyond.' By the transit of Venus in 1769, it was demonstrated that the sun is 95,000,000 miles from the earth; and yet, distant as it is, its physical constitution has been determined; and the history of the successive steps by which this proof has been arrived at, forms one of the most interesting chapters in the progress of science.

It was in 1611 that Fabricius, a Dutch astronomer, first observed spots on the eastern edge of the sun, which passed slowly across the disk to the western edge, and disappeared after a certain number of days. This phenomenon having been often noted subsequently, the conclusion drawn therefrom is, that the sun is a spherical body, having a movement of rotation about its centre, of which the duration is equal to twenty-five days and a half. These dark spots, irregular and variable, but well defined on their edge, are sometimes of considerable dimensions. Some have been seen whose size was five times that of the earth. They are generally surrounded by an aureola known as the *penumbra*, and sensibly less luminous than the other portions of the orb. From this penumbra, first observed by Galileo, many apparently singular deductions have been made: namely, 'The sun is a dark body, surrounded at a certain distance by an atmosphere which may be compared to that of the

earth, when the latter is charged with a continuous stratum of opaque and reflecting clouds. To this first atmosphere succeeds a second, luminous in itself, called the *photosphere*. This photosphere, more or less remote from the inner cloudy atmosphere, would determine by its outline the visible limits of the orb. According to this hypothesis, there would be spots on the sun every time that there occurred in the two concentric atmospheres such corresponding clear spaces as would allow of our seeing the dark central body uncovered.

This hypothesis is considered by the most competent judges to render a very satisfactory account of the facts. But it has not been universally adopted. Some writers of authority have lately represented the spots as scoriae floating on a liquid surface, and ejected from solar volcanoes, of which the burning mountains of the earth convey but a feeble idea. Hence observations become necessary as to the nature of the incandescent matter of the sun; and when we remember the immense distance of that body, such an attempt may well appear to be one of temerity.

The progress of optical science, however, has given us the means of determining this apparently insoluble question. It is well known, that physicists are enabled at present to distinguish two kinds of light—natural light and polarised light. A ray of the former exhibits the same properties on any part of its form; not so the latter. A polarised ray is said to have sides, and the different sides have different properties, as demonstrated by many interesting phenomena. Strange as it may seem, these rays thus described as having sides, could pass through the eye of a needle by hundreds of thousands without disturbing each other. Availing themselves, therefore, of the assistance of polarised light, and an instrument named the polariscope, or polarising telescope, observers obtain a double image of the sun, both alike, and both white; but on reflecting this image on water, or a glass mirror, the rays become polarised; the two images are no longer alike or white, but are intensely coloured, while their form remains unchanged. If one is red, the other is green, or yellow and violet, always producing what are called the complementary colours. With this instrument, it becomes possible to tell the difference between natural and polarised light.

Another point for consideration is, that for a long time it was supposed, that the light emanating from any incandescent body always came to the eye as natural light, if in its passage it had not been reflected or refracted. But experiment by the polariscope showed, that the ray departing from the surface at an angle sufficiently small was polarised; while at the same time, it was demonstrated that the light emitted by any gaseous body in flame—that of street-lamps, for instance—is always in the natural state, whatever be its angle of emission. From these remarks, some idea will be formed of the process necessary to prove whether the substance which renders the sun visible is solid, liquid, or gaseous. On looking at the sun in the polariscope, the image, as before observed, is seen to be purely white—a proof that the medium through which the luminous substance is made visible to us is gaseous. If it were liquid, the light would be coloured; and as regards solidity, that is out of the question—the rapid change of spots proves that the outer envelope of the sun is not solid. On whatever day of the year we examine, the light is always white. Thus, these experiments remove the theory out of the region of simple hypothesis, and give certainty to our conclusions respecting the photosphere.

Here an example occurs of the aids and confirmations which science may derive from apparently trivial circumstances. Complaint was made at a large warehouse in Paris, that the gas-fitters had thrown the light on the goods from the narrow, and not from the broad side of the flame. Experiments were instituted,

which proved that the amount of light was the same whether emitted from the broad or narrow surface. It was shewn also, that a gaseous substance in flame appears more luminous when seen obliquely than perpendicularly, which explains what are known as *facule* and *lucule*, being those parts of the solar disk that shew themselves brighter than other portions of the surface. These are due to the presence of clouds in the solar atmosphere; the inclined portions of the clouds appearing brightest to the spectator. The notion, that there were thousands on thousands of points distinguishing themselves from the rest by a greater accumulation of luminous matter, is thus disposed of.

Still, there remained something more to be determined. The existence of the photosphere being proved, the question arose—was there nothing beyond? or did it end abruptly? and this could only be determined at the period of a total eclipse, at the very moment when the obscuration of the sun being greatest, our atmosphere ceases to be illuminated. Hence the interest felt in an eclipse of the sun of late years.

In July 1842, at a total eclipse of the sun visible in several parts of the continent, the astronomers noticed, just as the sun was hidden by the moon, certain objects, in the form of rose-coloured protuberances, about two or three minutes high, astronomically speaking, projected from the surface of the moon. These appearances were variously explained: some supposed them to be lunar mountains; others saw in them effects of refraction or diffraction; but no precise explanation could be given; and mere guesses cannot be accepted as science. Others, again, thought them to be mountains in the sun, the summits stretching beyond the photosphere; but at the most moderate calculation, their height would have been about 60,000 miles—an elevation which, as is said, the solar attraction would render impossible. Another hypothesis was, that they were clouds floating in a solar, gaseous atmosphere.

M. Arago considers the last as the true explanation: it remained the great point to be proved. If it could be ascertained, that these red protuberances were not in actual contact with the moon, the demonstration would be complete. Speculation was busy, but nothing could be done in the way of verification until another eclipse took place. There was one in August 1850 total to the Sandwich Islands, at which, under direction of the French commandant at Tahiti, observations were made, the result being that the red prominences were seen to be separated by a fine line from the moon's circumference. Here was an important datum. It was confirmed by the observations of July 1851, by observers of different nations at different localities, who saw that the coloured peaks were detached from the moon; thus proving that they are not lunar mountains.

If it be further ascertained, that these luminous phenomena are not produced by the inflexion of rays passing over the asperities of the moon's disk, and that they have a real existence, then there will be a new atmosphere to add to those which already surround the sun; for clouds cannot support themselves in empty space.

We come next to that part of the subject which treats of the true place of the sun in the universe. In the year 448 B.C., Archelaus, the last of the Iodian philosophers, without having made any measurements, taught that the sun was a star, but only somewhat larger than the others. Now, the nearest fixed star is 206,000 times further from us than the sun: 206,000 times 95,000,000 of miles—a sum beyond all our habits of thought. The light from the star *Alpha* of the Centaur is three years in its passage to the earth, travelling at the rate of 192,000 miles per second; and there are 86,400 seconds in a day, and 365 days in a year. Astonishing facts! If the sun, therefore, were removed to the distance of a Centauri, its broad disk, which takes a considerable time in its majestic rising and setting

above and below the horizon, would have no sensible dimensions, even in the most powerful telescopes; and its light would not exceed that of stars of the third magnitude—facts which throw the guess of Archelaüs into discredit. If our place in the material universe is thus made to appear very subordinate, we may remember, as M. Arago observes, that man owes the knowledge of it entirely to his own resources, and 'thereby has raised himself to the most eminent rank in the world of ideas. Indeed, astronomical investigations might not improperly excuse a little vanity on our part.'

Among the stars, Sirius is the brightest; but twenty thousand millions of such stars would be required to transmit to the earth a light equal to that of the sun. And if it were difficult to ascertain the nature and quality of the sun, it would appear to be still more so to determine these points with regard to the stars; for the reason, that the rays, coming from all parts of their disk, at once are intermingled, and of necessity produce white. This difficulty did not exist in similar investigations on the sun, because its disk is so large, that the rays from any one part of it may be examined while the others are excluded. Under these circumstances, further proof might seem to be hopeless; but advantage was taken of the fact, that there are certain stars which are sometimes light, sometimes dark, either from having a movement of rotation on their own axis, or because they are occasionally eclipsed by a non-luminous satellite revolving around them. It is clear, that while the light is waxing or waning, it comes from a part only of the star's disk; consequently, the neutralization of rays, which takes place when they depart from the whole surface at once, cannot then occur; and from the observations on the portion of light thus transmitted, and which is found to remain white under all its phases, we are entitled to conclude, in M. Arago's words, that 'our sun is a star, and that its physical constitution is identical with that of the millions of stars strewn in the firmament.'

BARBARA'S SEA-SIDE EXCURSION.

It certainly appeared a most improbable circumstance, that any event should occur worthy of being recorded, to vary the even tenor of life which Mr and Mrs Norman enjoyed in the holy state of matrimony. They were young folks—they had married from affection—and, moreover, their union had been a strictly prudent one; for their income was more than sufficient for all their unambitious wants and tastes; and it was also a 'certainty,' a great good in these days of speculation and going ahead. Charles Norman held a government situation, with a small but yearly increasing salary; his residence was at Pentonville; and his domestic circle comprised, besides his good, meek helpmeet, two little children, and an only sister, some years Charles's junior: indeed, Bab Norman had not very long quitted the boarding-school. Bab and Charles were orphans, and had no near relatives in the world; therefore Bab came home to live with her dear brother and his wife until she had a home of her own—a contingency which people whispered need not be far off, if Miss Barbara Norman so inclined. This piece of gossip perhaps arose from the frequent visits of Mr Norman's chosen friend, Edward Leslie—a steady and excellent young man, who filled an appointment of great trust and confidence in an old-established commercial house. Edward Leslie was not distinguished for personal attractions or captivating manners; but he was an honest, manly, generous-hearted fellow, and sensitive enough to feel very keenly sometimes that the

pretty spoiled little Barbara laughed at and snubbed him. Notwithstanding Bab's folly, however, it would have given her great pain had Edward Leslie courted another. He was patient and forbearing; and she fluttered and frisked about, determined to make the most of her liberty while it lasted. 'Of course she meant to marry some day,' she said with a demure smile, 'but it would take a long-time to make up her mind.'

Charles quite doted on his pretty sister, and often could not find it in his heart to rebuke her, because she was motherless, and had only him and Cary to look to; and Cary's office was not to rebuke any one, much less her dear little sister-in-law. So Barbara was spoiled and humoured; while the children were kept in high order—a proper discipline being exercised in the nursery, as became a well-regulated and nicely-decorated house. Cary thought Bab a beauty, and so did Charles; the young lady herself was not at all backward in estimating her own charms; and it was a pity to see them so often obscured by affectation, for Bab had a kind heart and an affectionate disposition. One day when Charles returned home after business-hours were over, Bab flew towards him with an unusually animated countenance, holding an open letter in her hand, and exclaiming: 'Oh, dear Charles, read this! You'll let me go—won't you? I never was at the seaside in my life, you know; and it will do me such a deal of good.'

Charles smiled, took the letter, and tapping his sister's dimpled rosy cheek, he said fondly: 'I don't think, Bab, that you want "doing good to" so far as health is concerned. The sea-air cannot improve these roses.'

'Well, well, Charles, never mind the roses—there's a dear. They only ask me to go for a fortnight, and I should so like it; it will be so nice to be with one's school-mates at the sea. Bell and Lucy Combermere are such bathers, they say; and as for me, I do believe, Charles, I shall drown myself for love of the sea! Oh, you must let me go—do!'

There was no resisting this coaxing; so Charles said he 'would see about it, and talk the matter over with Caroline.'

'Cary thinks it will be delightful for me,' exclaimed Barbara: 'she's always a good-natured darling.' And Bab felt sure of going, if Charles talked the matter over with Cary; so she flew off in an ecstasy of joy, dancing and singing, and forthwith commenced preparations, by pulling off the faded pink ribbons which adorned her bonnet, and substituting gay bright new streamers.

The invitation in question came from Mrs Combermere, who, with her two unmarried daughters, were sojourning at a favourite watering-place—always crowded during the season—and where Mr Combermere, a rich citizen, could join his family every week, and inhale a breath of pure air. Charles did not particularly like the Combermeres. Mrs Combermere was a fussy woman, full of absurd pretension, and with a weakness for forming aristocratic acquaintance, which had more than once led her into extravagance, ending in disappointment and mortification. The Misses Combermere inherited their mamma's weakness; they were comely damsels, and expectant sharers of papa's wealth, who was 'very particular' on whom he bestowed his treasures. Bell and Lucy had been at school with Barbara Norman, and a strong friendship—a school friendship—had been struck up amongst the trio, whom the French dancing-master denominated 'the Graces.' And now Barbara had received an invitation to stay with them for a fortnight, a private postscript being inserted by Miss Bell, to the effect that 'Bab must be sure to come very smart, for there were most elegant people there, and *such beaux*!'

Bab went accordingly on Saturday, escorted by Mr

Combermere, who always returned on the following Monday. Never before had Bab beheld so gay a scene; never till now had she looked on the glorious ocean; never had she promenaded to the sounds of such exhilarating music. Her pretty little head was quite bewildered, though in the midst of all her delight she wished for Charles and Cary, and the children; there was such delicious bathing for the tiny ones; such digging with their little spades in the golden sands! Innocent, happy gold-diggers they!

She found Mrs Combermere and the girls in the full swing of sea-side dissipation—quite open-house kept, free-and-easy manners, which at home would not have been tolerated. But it came only once a year, and they could afford it. Quite established as an intimate, was a tall young gentleman, with delicate moustache, who seemed to be on terms of friendly familiarity with half the aristocracy of the nation. Mrs Combermere whispered to Bab, that Mr Newton was a most 'patrician person,' of the 'highest connections;' they had met with him on the sands, where he had been of signal use in assisting Mrs Combermere over the shingles on a stormy day. He was so gentlemanly and agreeable, that they could not do otherwise than ask him in; he had remained to tea, and since then had been a regular visitor.

Mr Newton had been at first treated with great coolness by Mr Combermere; the latter gentleman did not like strangers, and always looked on a moustache with suspicion. But Mr Newton was so deferential, so unexceptionable in deportment, and prudent in his general sentiments, warmly advocating Mr Combermere's political opinions, that he had at last won the good opinion even of the father of the family. Besides, he paid no particular attention to the Misses Combermere: there was no danger of his making up to them—that was clear; and Mrs Combermere, mother-like, felt a little mortified and chagrined at such palpable indifference. But when pretty Bab Norman appeared, the case was different: her brunette complexion and sparkling dark eyes elicited marked admiration from the patrician Mr Newton; and he remarked in an off-hand way—*sotto voce*, as if to himself: 'By Jupiter! how like she is to dear Lady Mary Manvers.' Bab felt very much flattered by the comparison, and immediately began to like Mr Newton immensely; he was so distinguished, so fascinating, so refined. Bab did not add, that he had singled her out as an especial object of attention, even when the fair dashing Misses Combermere challenged competition.

The fortnight passed swiftly away—too swiftly, alas! thought little Barbara Norman; for at the expiration of the term, Mrs Combermere did not ask her to prolong the visit, but suffered her to depart, again under the escort of Mr Combermere, without a word of regret at parting. Cruel Mrs Combermere! she wished to keep Mr Newton's society all to herself and her daughters! However, the young gentleman asked Barbara for permission to pay his respects to her when he returned to the metropolis; this had been accorded by Barbara, who, on her return to Pentonville, for the first time found that comfortable home 'insufferably dull and stupid.' Edward Leslie, too—how dull and stupid even he was, after the chattering perfumed loungers of the elysium she had just quitted! Yet Edward was never considered either dull or stupid by competent judges; but, quite the contrary—a sensible, well-informed, gentlemanly personage. But, then, he had no great friends, no patrician weaknesses; he knew nothing about racing, or betting, or opera-dancers, or slang in general. In short, he seemed flat and insipid to Bab, who had been compared to the beautiful Lady Mary Manvers by the soft and persuasive tongue of Lady Mary Manvers's dear friend. Yet, in her secret heart of hearts, Bab drew comparisons by no means disadvantageous to Edward Leslie. 'Yea,' thought Bab, 'I like Mr Newton best

by the sea-side in summer-time, when harp-music floats on the balmy air; then I should always like him, if summer was all the year round. But for everyday life, for winter hours, for home, in short, I'm sure I like Edward Leslie best—I'm sure I love Edward Leslie;' and Bab blushed and hesitated, though she was quite alone. Cary listened good-naturedly to all Bab's descriptions of the happiness she had enjoyed; and Cary thought, from all Bab said, that Mr Newton must be at least some great lord in disguise. She felt quite nervous at the idea of his coming to such a humble house as theirs, when he talked of parks, and four-in-hands, and baronial halls, as things with which he was familiar, and regarded as matters of course. Cary hoped that Charles and Edward Leslie would be present when Mr Newton called, because they were fit to associate with royalty itself. Cary had a very humble opinion of herself—sweet, gentle soul! Charles often wished his dear sister Bab might closely resemble her. At length, Bell Combermere wrote to say, they were about returning to town; and Mr Newton declared he could not remain behind. Bab's heart fluttered and palpitated at each sound the knocker gave; and she was thankful that Cary's cousin, Miss Ward, was staying with them, to call attention off from herself.

Miss Ward was an accomplished, charming woman of middle age, who for years had resided in the Earl of St Elmer's family as governess—greatly valued for her many estimable qualities. Not being in robust health, she had absented herself for a short season from her onerous duties, and in her dear friend and cousin's house, sought and obtained quiet and renovation. Miss Ward often found difficulty in repressing a smile at Bab's superfluous graces and animated gestures; but it was a kindly smile, for the stately conventionalities amongst which she usually existed, rendered these traits of less refined manners rather refreshing than otherwise. Miss Ward was out when Mrs Combermere's equipage drove up to Mr Norman's door; and that large lady, with her daughter Bell, accompanied by Mr Newton, made their way up stairs to Mrs Norman's drawing-room. Mrs Combermere was always astoundingly grand and patronising when she honoured Cary with a call; Mrs Combermere liked to call upon folks whom she denominated inferiors—to impress them with an overwhelming idea of her importance. But on the simple-minded literal Cary, this honour was lost, she received it with such composure and unconscious placidity: on Bab it produced, indeed, the desired effect; but whether it was Mrs Combermere's loud talking and boasting, or Mr Newton's easy negligence and patronising airs, that caused her to colour and hesitate, it is not possible to define. Bab was not herself; and she began to be ashamed of living in Pentonville, when Mr Newton spoke of Belgravia. Miss Ward, who had returned from her shopping excursion, glided into the room unnoticed, in the middle of a description Mr Newton was giving of a magnificent place, belonging to a dear friend, with whom he had been staying, ere he had the 'unspeakable felicity of meeting Mrs Combermere.'

'Your description is a graphic one, John Blomfield,' said Miss Ward in a low voice close to his ear; 'but how came you here—in this company?'

John Blomfield, *alias* John Newton, started as if an adder had bitten him, and gazed frantically upon the intruder. 'Miss Ward, madam,' he exclaimed involuntarily, 'don't say more, and I'll go this instant!'

'Then go,' continued Miss Ward majestically, pointing to the door; 'and beware, John Blomfield, how you dare to enter a gentleman's house unauthorised again.'

Pale and crest-fallen, the young gentleman and dear friend of Lady Mary Manvers vanished; nor did he require a second bidding to rush down stairs, and out

at the front-door, which was slammed violently after him.

'What does this mean, ma'am?' inquired Mrs Combermere, very red in the face, and looking terribly frightened—'what does this all mean, ma'am?'

'Only,' replied Miss Ward quietly, 'that this individual, who calls himself Mr Newton, and whose conversation I overheard after entering the apartment, is in reality John Blomfield, *ci devant* valet to Lord Lilburne, the eldest son of the Earl of St Elmer, in whose family I have the honour to be governess. His lordship shewed toleration and kindness unprecedented towards the ungrateful young man, on account of his respectable parentage, and the excellent abilities and aptitude for instruction he displayed. But I grieve to say, John Blomfield was discharged from Lord Lilburne's service, under circumstances which left no doubt on our minds that he was guilty of dishonest practices—of pilfering, in short, to a considerable extent. We heard that he still continued his evil course; but though knowing him to possess both skill and effrontery, I was almost as much startled as the delinquent himself, to behold him thus playing the fine gentleman, and lounging on Cary's sofa.'

A faint groan escaped from Miss Combermere as she ejaculated: 'Oh, my pearl necklace!' and a still deeper and more audible sigh from her mamma, as the words burst forth: 'Oh, my diamond *bandeau*!' which led to an explanation from the distressed and bewildered ladies, of how they had intrusted these precious jewels to Mr Newton, who urged them on returning to town to have them reset, volunteering to take them himself to Lady Mary Manvers's own jeweller, a 'first-rate fellow, who worked only for the aristocracy.' 'They must not be in a hurry,' Mr Newton said, 'for the first-rate fellow was so torn to pieces by duchesses and countesses, that even weeks might elapse before their comparatively trifling order could be attended to.'

'I fear,' said Miss Ward commiseratingly, 'that you will not see your valuables again. John Blomfield is a clever rascal, and has good taste too,' continued Miss Ward smiling, 'for he invariably selects pretty things. I hope, my dear—turning to Bab, who sat silent and petrified—'your beautiful gold repeater set with brilliants is safe, and that it did not require repairs or alterations, to induce you to part with it into Mr Newton's hands? I doubt not he had an eye to it eventually.'

Poor Bab—what a blow to her vanity! She could only murmur something about the watch being very dear to her, because it had belonged to her deceased mother, and that she always wore it round her neck.

'And I don't think that Bab would part with it out of her hands to any one,' said Cary, 'if we except ourselves, save to Edward Leslie; but he is such a careful soul, that one would not mind intrusting him with the most precious treasure on earth.'

Bab blushed very deeply at this speech, because she saw a covert smile on Miss Ward's speaking countenance. That lady, notwithstanding her amiability and philanthropic character, rather enjoyed the consternation and confusion of Mrs and Miss Combermere, who retreated more humbly than they had entered, having received a lesson which, it is to be hoped, they profited by for the remainder of their lives. The pearl necklace and diamond *bandeau* were not recovered, though a reward was offered by the enraged Mr Combermere for the apprehension of the thief; yet Miss Bell with tears declared, that she would far rather lose her pearl necklace than give evidence against one whose attractive qualities she could not cease to remember.

Very shortly after this affair, Barbara had another short trip to the sea-side, and with a companion whose happiness equalled her own: it was the honeymoon excursion, and Edward Leslie was Bab's companion

for life. After this second sea-side sojourn, the bride returned to a pretty house of her own, quite near to Charles and Cary; and Barbara was never heard to complain of finding it dull or stupid, though summer does not last all the year round with any of us.

MR JERDAN'S AUTOBIOGRAPHY.

THE first of a series of volumes, designed to contain the literary, political, and social reminiscences of Mr Jerdan during the last fifty years, has just seen the light. It will be found to be one of the most amusing books of the day, and also not without a moral of its own kind. We presume it is of no use to debate how far it is allowable to bring before the public matters pertaining to private life, and about which living individuals may feel a delicacy. The time for such questions seems past. Assuming so much, we at least feel pretty sure that the lives and characters of living men could scarcely be in gentler or more genial hands than those of William Jerdan.

Mr Jerdan is chiefly known as having been for a third of a century the editor of the *London Literary Gazette*, a work which used to report on literature with a sympathy for authors strikingly in contrast with the tone of some of its contemporaries, in whom it would almost appear as if the saying of a kind word, or even the doing of simple justice towards a book, were felt as a piece of inexcusable weakness. He is now, at seventy, relieved from his cares, with little tangible result from his long and active career; but for this the readers of his autobiography will be at no loss to account. Jerdan has evidently been a kind-hearted, mirth-making, to-morrow-defying mortal all his days, as if he had patriotically set himself from the beginning to prove that Scotland could produce something different from those hosts of staid, sober, calculating men for which it has become so much distinguished. We speak here, indeed, according to the English apprehension of the Scotch character, for in Scotland, strange to say—that is, to Englishmen it will appear strange—the people believe themselves to be remarkable for want of foresight—'aye wise ahint the hand,' is their own self-portraiture—and for a certain ardour of genius which leads them into all sorts of scrapes. The issue is, after all, a hard one, and viewing the long services of Mr Jerdan to the literary republic, we would hope that a cheerful life-evening is still in store for him.

Our autobiographer tells, with all due modesty, of his early days at Kelso—the respectable friends by whom he was surrounded—his acquiring the reputation of a clever youth, and running nigh being a good deal spoilt in consequence. At nineteen, he went to London, to enter the counting-house of a mercantile uncle, and during two years spent there, formed an acquaintance with a group of young men, several of whom have since become distinguished. Among these were Messrs Pirie and Lawrie, since Lord Mayors of London—David, William, and Frederick Pollock, of whom the last is now Chief Baron of Exchequer—and Mr Wilde, who has since been Lord Chancellor. Interrupted in his career by a severe illness, he returned to Scotland to recruit, and soon after was placed with an Edinburgh writer to the Signet, to study the mysteries of law. The Scottish capital was then a much more frolicsome place than now, and Jerdan entered heartily into all its humours, spent merry evenings with Tom Sheridan and Joseph Gillan, attended mason-lodges, joined the Volunteers, and, seeing a fountain one day, wished to be it, for then he should have nothing to do but play. The natural result followed in a second severe illness, out of which his kind master, Corrie Elliott, endeavoured to recover him by a commission to ride through a range of mountain parishes in the south, in order to search for genealogical particulars illustrative of a case between Lady Forbes, born Miss Hunter of Polmoed,

and two gentlemen named Hunter, who claimed her estate.

'I travelled,' says our autobiographer, 'from manse to manse, and received unbounded hospitalities from the ministers, whilst I examined their kirk-registers, and extracted from them every entry where the name of Hunter or Welsh was to be found. Never was task more gratifying. The *bonhomie* of the priests, and the simplicity of their parishioners, were a new world to me, whilst they, the clergy, men of piety and learning, considered themselves as out of the world altogether. The population was thin and scattered, the mode of living primitive in the extreme, and the visit of a stranger, so insignificant as myself, quite enough to make a great sensation in these secluded parts. I found the ministers ingenuous, free from all puritanism, and generally well informed. . . . The examination of the parish books was also a labour of love and source of endless amusement. They mostly went as far back as a century and a half, and were, in the elder times, filled with such entries as bespoke a very strange condition of society. The inquisitorial practices and punitive powers of the ministry could not be exceeded in countries enslaved by the priesthood of the Church of Rome. Forced confessions, the denial of religious rites even on the bed of death, excommunication, shameful exposures, and a rigid and minute interference in every domestic or private concern, indicated a state of things which must have been intolerable. High and low were obliged to submit to this offensive discipline and domination. . . . My duty was thus pleasantly and satisfactorily performed. My note-book was full. My skill in deciphering obsolete manuscript was cultivated and improved; and my health was restored as if by miracle. Of other incidents and results I shall only state, that on one occasion, to rival Bruce in Abyssinia, I dined off mutton whilst the sheep nibbled the grass upon the lawn, our fare being the amputated tails of the animals, which made a very dainty dish—that on reaching Edinburgh, my hackney, having from a dark gallop over a ground where a murder had been committed not long before, and being put into a cold stable, lost every hair on its hide like a scalded pig, subjected me to half his price in lieu of damage—and that the famous and ancient Polmood remained in the possession of Lord Forbes, as inherited from the charter of King Robert, who gave the lands for ever, "as high up as heaven, and as low down as hell," to the individual named in the grant, which was witnessed "by Meg, my wife, and Marjory, my nourice."

Despairing of doing any good in Edinburgh, Mr Jerdan, while still only twenty-three, resorted once more to London, though without any definite object in view. While pursuing his usual light-hearted career, he got into debt and difficulties, and experienced the consequent annoyances with the sense of being an injured man, 'whereas it was I who had wronged myself.' 'It was now,' he adds, 'that I got my first lesson of that fatal truth—that debt is the greatest curse which can beset the course of a human being. It cools his friends and heats his enemies; it throws obstacles in the way of his every advance towards independence; it degrades him in his own estimation, and exposes him to humiliation from others, however beneath him in station and character; it marks him for injustice and spoil; it weakens his moral perceptions and benumbs his intellectual faculties; it is a burden not to be borne consistently with fair hopes of fortune, or that peace of mind which passeth all understanding, both in a worldly and eternal sense. But I shall have much to say on the subject in the future pages of this biography, though I cannot omit the opportunity afforded by my earliest taste of the bitter fruit which poisons every pulse of existence, earnestly to exhort my youthful readers to deny them-

selves every expense which they cannot harmlessly afford, and revel on bread and water and a lowly couch, in humility and patience, rather than incur the obligation of a single sixpence beyond their actual means.'

At length, about 1806, he gravitated into what was perhaps his natural position—the press; taking a concern in a daily paper called the *Aurora*, which was got up by the hotel-keepers of London. This speculation did not answer. It was destined to verify a late saying: 'If you want anything spoilt or ruined, you cannot do better than confide it to a committee.' 'Our rulers,' says Jerdan, 'though intelligent and sensible men, were neither literary nor conversant with journalism. Under any circumstances, their interference would have been injurious, but it was rendered still more fatal by their differences in political opinion, and two or three of the number setting up to write "leaders" themselves. The clashing and want of *ensemble* was speedily obvious and detrimental; our readers became perfect weathercocks, and could not reconcile themselves to themselves from day to day. They wished, of course, to be led, as all well-informed citizens are, by their newspaper; and they would not blow hot and cold in the manner prescribed for all the coffee-room politicians in London. In the interior, the hubbub and confusion of the republic of letters was meanwhile exceedingly amusing to the looker-on; we were of all parties and shades of opinion: the proprietor of the King's Head was an ultra Tory, and swore by George III. as the best of sovereigns—the Crown Hotel was very loyal, but more moderate—the Bell Inn would give a strong pull for the Church—whilst the Cross-Keys was infected with Romish predilections. The Cockpit was warlike; the Olive-Tree, pacific; the Royal Oak, patriotic; the Rummer, democratic; the Hole-in-the-Wall, seditious. Many a dolorous pull at the porter-pot and sapientious declination of his head had the perplexed and bemused editor, before he could effect any tolerable compromise of contradictions for the morning's issue: at the best, the sheet appeared full of signs and wonders!' In short, the paper failed.

Mr Jerdan passed through various situations on various papers, as the elegant language of Cockneydom hath it, and thus he has been enabled to give some curious sketches of the *personnel* of the press in those days. In the *Morning Post*, he took a strong part against the Mary-Anne-Clarke investigation, and caused a marvellous sinking of the circulation in consequence. He, nevertheless, consented to go and see that celebrated lady, and confesses to have been softened by her blandishments. One of the most remarkable occurrences of that period was his witnessing the assassination of the prime minister, Perceval, in May 1812. He had saluted the premier, as he was passing into the lobby of the House of Commons, and had held back the spring-door to allow him precedence in entering, when instantly there was a noise within. 'I saw a small curling wreath of smoke rise above his head, as if the breath of a cigar; I saw him reel back against the ledge on the inside of the door; I heard him exclaim: "O God!" or "O my God!" and nothing more or longer (as reported by several witnesses), for even that exclamation was faint; and then, making an impulsive rush, as it were, to reach the entrance to the House on the opposite side for safety, I saw him totter forward, not half way, and drop dead between the four pillars which stood there in the centre of the space, with a slight trace of blood issuing from his lips.

'All this took place ere, with moderate speed, you could count five! Great confusion, and almost as immediately great alarm, ensued. Loud cries were uttered, and rapidly conflicting orders and remarks on every hand made a perfect Babel of the scene; for there were above a score of people in the lobby, and on the instant no one seemed to know what had been done

or by whom. The corpse of Mr Perceval was lifted up by Mr William Smith, the member for Norwich, assisted by Lord Francis Osborne, a Mr Phillips, and several others, and borne into the office of the Speaker's secretary, by the small passage on the left hand, beyond and near the fireplace. Pallid and deadly, close by the murderer, it must have been; for in a moment after, Mr Eastaff, one of the clerks of the Vote Office at the last door on that side, pointed him out, and called: "That is the murderer!" Bellingham moved slowly to a bench on the hither side of the fireplace, near at hand, and sat down. I had in the first instance run forward to render assistance to Mr Perceval, but only witnessed the lifting of his body, followed the direction of Mr Eastaff's hand, and seized the assassin by the collar, but without violence on one side, or resistance on the other. Comparatively speaking, a crowd now came up, and among the earliest Mr Vincent Dowling, Mr John Norris, Sir Charles Long, Sir Charles Burrell, Mr Henry Burgess, and, in a minute or two, General Gascoigne from a committee-room up stairs, and Mr Hume, Mr Whitbread, Mr Pole, and twelve or fifteen members from the House. Meanwhile, Bellingham's neckcloth had been stripped off, his vest unbuttoned, and his chest laid bare. The discharged pistol was found beside him, and its companion was taken, loaded and primed, from his pocket. An opera-glass, papers, and other articles, were also pulled forth, principally by Mr Dowling, who was on his left, whilst I stood on his right hand; and except for his frightful agitation, he was as passive as a child. Little was said to him. General Gascoigne on coming up, and getting a glance through the surrounding spectators, observed that he knew him at Liverpool, and asked if his name was Bellingham, to which he returned no answer; but the papers rendered further question on this point unnecessary. Mr Lynn, a surgeon in Great George Street, adjacent, had been hastily sent for, and found life quite extinct, the ball having entered in a slanting direction from the hand of the tall assassin, and passed into his victim's heart. Some one came out of the room with this intelligence, and said to Bellingham: "Mr Perceval is dead! Villain! how could you destroy so good a man, and make a family of twelve children orphans?" To which he almost mournfully replied: "I am sorry for it." Other observations and questions were addressed to him by bystanders; in answer to which he spoke incoherently, mentioning the wrongs he had suffered from government, and justifying his revenge on grounds similar to those he used, at length, in his defence at the Old Bailey.

I have alluded to Bellingham's "frightful agitation" as he sat on the bench, and all this dreadful work was going on; and I return to it, to describe it as far as words can convey an idea of the shocking spectacle. I could only imagine something like it in the overwrought painting of a powerful romance-writer, but never before could conceive the physical suffering of a strong muscular man, under the tortures of a distracted mind. Whilst his language was cool, the agonies which shook his frame were actually terrible. His countenance wore the hue of the grave, blue and cadaverous; huge drops of sweat ran down from his forehead, like rain on the window-pane in a heavy storm, and, coursing his pallid cheeks, fell upon his person, where their moisture was distinctly visible; and from the bottom of his chest to his gorge, rose and receded, with almost every breath, a spasmodic action, as if a body, as large or larger than a billiard-ball, were choking him. The miserable wretch repeatedly struck his chest with the palm of his hand to abate this sensation, but it refused to be repressed.

Our author makes a curious remark on the case—namely, that the first examinations are calculated to give the future historian a more faithful idea of the trans-

action than the record of the trial. Even in the short interval of four days, witnesses had become confused in their recollections, mistaking things which they had only heard of for things they had beheld. The unhappy culprit perished on the scaffold only a week after his crime.

Jerdan, who assumed the editorship of the *Sun* in 1818, was a flaming Tory of the style of that day, and accordingly enjoyed the triumph of Europe over Bonaparte. In Paris, immediately after the Allies had entered it, he feasted his eyes with the singular spectacles presented, and the personal appearance of the heroes he had been employed for some years in celebrating. Here is a scene at Beauvillier's restaurant in the Rue de Richelieu, where 700 people dined every day. 'It was on the first or second day, that a fair Saxon-looking gentleman came and seated himself at my table. I think he chose the seat adventitiously, from having observed or gathered that I was fresh from London. We speedily entered into conversation, and he pointed out to me some of the famous individuals who were doing justice to the Parisian cookery at the various tables around—probably about twenty in all. As he mentioned their names, I could not repress my enthusiasm—a spirit burning over England when I left it only a few days before—and my new acquaintance seemed to be much gratified by my ebullitions. "Well," said he to a question from me, "that is Davidoff, the colonel of the Black Cossacks." I shall not repeat my exclamations of surprise and pleasure at the sight of this terrific leader, who had hovered over the enemy everywhere, cut off so many resources, and performed such incredible marches and actions as to render him and his Cossacks the dread of their foes. "Is this," inquired my companion, "the opinion of England?" I assured him it was, and let out the secret of my editorial consequence, in proof that I was a competent witness. On this, a change of scene ensued. My *incognito* walked across to Davidoff, who forthwith filled, and sent me a glass of his wine—the glass he was using—and drank my health. I followed the example, and sent mine in return, and the compliment was completed. But it did not stop with this single instance. My new fair-complexioned friend went to another table, and spoke with a bronzed and hardy-looking warrior, from whom he came with another similar bumper to me, and the request that I would drink wine with General Czernicheff. I was again in flames; but it is unnecessary to repeat the manner in which I, on that to me memorable day, took wine with half a dozen of the most distinguished generals in the allied service.

Whilst this toasting-bout was going on, a seedy-looking old gentleman came in, and I noticed that some younger officers rose and offered him a place, which he rejected, till a vacancy occurred, and then he quietly sat down, swallowed his two dozen of green oysters as a whet, and proceeded to dine with an appetite. By this time, my *vis-à-vis* had resumed his seat, and, after what had passed, I felt myself at liberty to ask him the favour of informing me who he himself was! I was soon answered. He was a Mr Parish, of Hamburg, whose prodigious commissariat engagements with the grand army had been fulfilled in a manner to prosper the war; and I was now at no loss to account for his intimacy with its heroes. It so happened that I knew, and was on friendly terms with some of his near relations; and so the two hours I have described took the value of two years. But the climax had to come. Who was the rather seedy-looking personage whom the aide-de-camp appeared so ready to accommodate? Oh, that was Blucher! If I was outrageous before, I was mad now. I explained to Mr Parish the feeling of England with regard to this hero; and that, amid the whole host of great and illustrious names, his had become the most glorious of all, and was really the one which

filled most unanimously and loudly the trump of fame. He told me that an assurance of this would be most gratifying to the marshal, who thought much of the approbation of England, and asked my leave to communicate to him what I had said. I could have no objection; but after a short colloquy, Blucher did not send his glass to me—he came himself; and I hobbled with the immortal soldier. I addressed him in French, to which he would not listen; and I then told him in English of the glorious estimation in which he was held in my country, which Mr Parish translated into German; and if ever high gratification was evinced by man, it was by Blucher on this occasion. I had the honour of breakfasting with him at his hotel next morning, when the welcome matter was discussed more circumstantially; and he evinced the greatest delight.

Here we must part with Mr Jerdan, but only, we hope, to meet him again ere long in a second volume.

CRIMINAL TRIALS.

THE SOMERSET AND OVERBURY TRAGEDY.

THE history of the unworthy favourites whom James I. of England raised to a power so extravagant, has always been surrounded with a tragic mystery. One of them, Buckingham, was stabbed by an assassin; the other, Somerset, was condemned to death for murder. The extravagant dignities and emoluments heaped on these unworthy men, are utterly beyond the belief of those who live under the constitutional government of the present day. Nor was it enough that they obtained the highest titles in the peerage, and large grants out of the public money; they were rewarded in a manner still more dangerous to the public welfare, by being invested with the great, responsible offices of state, which were thus held by young men totally inexperienced, instead of responsible and capable ministers. Of course, they distributed all the inferior offices among their relations and connections; and a witty annalist of the day describes the children of the reigning favourite's kindred as swarming about the palaces, and skipping up and down the back-stairs like so many fairies. They had been raised in early youth from a humble condition to this dazzling elevation, and it was only too much in accordance with the frailty of human nature that they should lose head—feel as if they were under no responsibility to their fellow-men—and, as Shakspeare says, 'play such fantastic tricks before high Heaven, as make the angels weep.' Such rapid and ill-founded prosperity never lasts; and generally he who has ascended like a blazing rocket, tumbles to the earth like its charred and blackened socket.

Carr, afterwards made Earl of Somerset, was a raw Scotch youth, without education or training, when he was first brought under the notice of the king by chancing to have his leg broken in the royal presence in an attempt to mount a fiery horse. When once taken into favour, the king did not care whom he offended, or what injustice he did, to enrich the fortunate youth. When he was besought to spare the heritage of the illustrious and unfortunate Raleigh, he said peevishly: 'I mun have it for Carr—I mun have it for Carr!' The favourite desired to have for his wife the Lady Frances Howard, who had been married to the Earl of Essex. The holiest bonds must be broken to please him, and the marriage was shamefully dissolved. This did no great injury, indeed, to Essex. The union had been one entirely of interest, contracted

when both were mere children. He was the same Essex who afterwards figured in the civil war—a grave, conscientious, earnest man, who could have had little sympathy with a woman so giddy and unprincipled. She suited better with the profligate Somerset; but had it not been that the king's favourite demanded it to be dissolved, the original union would have been held sacred.

Great court pageants and festivities hailed the marriage of Carr with the divorced Lady Essex, and the proudest of England's nobility vied with each other in doing honour to the two vile persons thus unpropitiously united. The chief-justice, Coke, and the illustrious Bacon, bowed in the general crowd before their ascendancy. It has been maintained that Ben Jonson, in his rough independence, refused to write a masque for the occasion of these wicked nuptials; but this has been denied; and it is said, that the reason why his works contain no avowed reference to the occasion, is because they were not published until Somerset's fall. The event took place in 1613: three years afterwards, the same crowd of courtiers and great officers were assembled in Westminster Hall, to behold the earl and countess on their trial for murder.

Sir Thomas Overbury, a man of great talent, who lived, like many other people of that period, by applying his capacity to state intrigues, had been committed to the Tower at the instigation of Somerset. He died there suddenly; and a suspicion arose that he had been poisoned by Somerset and his countess. A curious account of the transactions which immediately followed, has been preserved in a work called *A Detection of the State and Court of England during the last Four Reigns*. It is the more curious, as the author, Roger Coke, was a grandson of Sir Edward, the great chief-justice, who was a principal actor in the scene. The king was at Royston, accompanied by Somerset, when it appears that Sir Ralph Winwood informed his majesty of the suspicions that were abroad against the favourite. The king immediately determined to inform Coke; but it is feared that the determination arose not from a desire to execute strict justice, but because another favourite, George Villiers, who afterwards became Duke of Buckingham, had already superseded Somerset in the king's esteem.

A message was immediately despatched to Sir Edward Coke, who lived in the Temple. He was in bed when it arrived, and his son, even for one who came in the king's name, would not disturb him; 'For I know,' he said, 'my father's disposition to be such, that if he be disturbed in his sleep, he will not be fit for any business; but if you will do as we do, you shall be welcome; and about two hours hence my father will rise, and you may then do as you please.' This was at one o'clock of the morning. Precisely at three, a little bell rang, announcing that the most laborious and profound lawyer whom England has ever produced, had begun the toilsome business of the day. It was his practice to go to bed at nine in the evening, and wake at three, and, in every other detail of his life, he pursued this with clock-work uniformity. When he saw the papers laid before him by the messenger, he immediately granted a warrant against Somerset, on a charge of murder.

The favourite, little knowing what a pitfall had been dug in his seemingly prosperous path, was still at Royston, enjoying the most intimate familiarity with the king, when the messenger returned. Deception was

so much of an avowed principle with King James, and was so earnestly supported by him, as one of the functions and arts of kingcraft, that in his hands it almost lost its treacherous character, and assumed the appearance of sincerity. He held that a king who acted openly and transparently, neglected his duty, as the vicergerent of the Deity; and that, for the sake of good government and the happiness of his people, he was bound always to conceal his intentions under false appearances, or, when necessary, under false statements. Somerset was sitting beside the king, whose hand rested familiarly on his shoulder, when the warrant was served on him. The haughty favourite frowned, and turned to his master with an exclamation against the insolence of daring to arrest a peer of the realm in the presence of his sovereign. But the king gave him poor encouragement, pretending to be very much alarmed by the power of the chief-justice, and saying: 'Nay, man, if Coke were to send for me, I must go.' Somerset was obliged to accompany the messenger. The king, still keeping up his hypocrisy, wailed over his departure—pathetically praying that their separation might not be a long one. It was said by the bystanders, that when Somerset was out of hearing, he was heard to say: 'The devil go wi' thee—I shall never see thy face more.'

The earl and countess were formally indicted before their peers on a charge of murder. It is now that the mystery of the story begins. It has never appeared clearly what motive they could have had for murdering Sir Thomas Overbury, and the evidence against them is very indistinct and incoherent; yet the countess confessed, and her husband was found guilty. It was attempted to be shewn, that Overbury had opposed the divorce of the Earl and Countess of Essex, and so had done his best to prevent the union of the favourite with the lady; but whatever opposition he had offered had been overcome; and it is difficult to suppose the revengeful passions so gratuitously pertinacious as to produce a deep assassination-plot from such a cause. So far as one can judge from the extremely disjointed notices of the evidence in the *State Trials* and elsewhere, it was very inconclusive. Sir Thomas certainly died of some violent internal attack. Other persons had been forming plans to poison him, and apparently were successful. The connection of these persons with the earl and countess was, however, faint. They were in communication with Overbury, and it is true some mysterious expressions were used by them—such as the lady saying to some one, that her lord had written to her how 'he wondered things were not yet despatched,' and such-like expressions. Then there was a story about the conveyance from the countess of 'a white powder,' intended as a medicine for Sir Thomas, and subsequently of some tarts. As to the latter, there was a letter from the countess to the lieutenant of the Tower, saying: 'I was bid to bid you say, that these tarts came not from me;' and again, 'I was bid to tell you, that you must take heed of the tarts, because there be letters in them, and therefore neither give your wife nor children of them, but of the wine you may, for there are no letters in it.' Through Somerset's influence, Sir W. Wade had been superseded as lieutenant of the Tower, and Sir Jervis Elwes appointed. It was said, that this was done for the purpose of having better opportunity for committing the murder. Elwes in his examination, however, hinted at the more commonplace crime of bribery as the cause of his elevation. 'He saith Sir T. Monson told him that Wade was to be removed, and if he succeeded Sir W. Wade, he must bleed—that is, give £2000.' To bleed is supposed, when so employed, to be a cant term of modern origin. It is singular how many of these terms, supposed to be quite ephemeral, are met with in old documents. 'Bilking a coachman' occurs in a trial of the reign of Charles II.—that of Coal for the murder of Dr Clench.

In an important part of the trial of Somerset there occurs another cant word: it is in the speech of Sir Randal Crew, one of the king's sergeants, against the accused. He represents the ghost of Overbury apostrophising his murderers in this manner: 'And are you thus fallen from me, or rather are you thus heavily fallen upon me to overthrow—to oppress him thus cruelly, thus treacherously, by whose vigilance, counsel, and labour, you have attained your honourable place, your estimation in the world for a worthy and well-deserving *gent.*?' After using this now well-known slang expression, the learned sergeant continues to say: 'Have I not waked, that you might sleep; cared, that you might enjoy? Have not I been the cabinet of your secrets, which I did ever keep faithfully, without the loss of any one to your prejudice; but by the officious, trusty, careful, and friendly use of them, have gained unto you a sweet and great interest of honour, love, reputation, wealth, and whatsoever might yield contentment and satisfaction to your desires? Have I done all this, to suffer this thus by you, for whom I have so lived as if my sand came in your hour-glass?'

This, though it does not divulge the secret of these strange proceedings, brings us apparently on their scent. It appears that Overbury had acted as the tutor and prompter of Somerset as a statesman. There is an expression sometimes used in politics at the present day, when an inexperienced person, who has the good-fortune to rise to some high office which he has not sufficient knowledge to administer, seeks instruction and guidance from some veteran less fortunate. He is then said to be put to nurse with him. A young ensign under training by a veteran sergeant is a good instance of this. Somerset, raw, uneducated, and untrained, had for his nurse as a courtier and politician the accomplished but less fortunate Sir Thomas Overbury. In the course of this function, Overbury could not fail to acquire some state secrets. It is supposed to have been on account of his possession of these secrets that Somerset poisoned him. But the affair goes further still, for we find that the king was much alarmed for himself on the occasion—was very anxious that the whole position of matters between Somerset and Overbury should not come out in the trial; and gave ground for the obvious inference, that whatever secrets there might be, his majesty was as deeply interested in their being kept as any one.

It was evident that the countess had been prevailed on to confess, and that the utmost pains had been used to get Somerset himself to follow her example, though, much to the king's vexation, he held out, and rendered a trial necessary. On this trial, however, there was nothing like satisfactory evidence—the peers were prepared to convict, and they did so on a few trifling attestations, which gave them a plausible excuse for their verdict. The illustrious Bacon aided the king in his object. He had on other occasions shewn abject servility to James—using towards him such expressions of indecorous flattery as these: 'Your majesty imitateth Christ, by vouchsafing me to touch the hem of your garment.' He was attorney-general, and had in that capacity to conduct the prosecution. Seeing distinctly the king's inclination, he sent a letter to him, praying, 'First, that your majesty will be careful to choose a steward [meaning a lord high-steward] to preside at the trial in the House of Lords] of judgment, that will be able to moderate the evidence, and cut off digressions; for I may interrupt, but I cannot silence; the other, that there may be special care taken for ordering the evidence, not only for the knitting but the list, and, to use your majesty's own words—the *confining* of it. This to do, if your majesty vouchsafe to direct it yourself, that is the best; but if not, I humbly pray you to require my lord chancellor, that he, together with my lord chief-justice, will confer with myself and

my fellows that shall be used for the marshalling and bounding of the evidence, that we may have the help of his opinion, as well as that of my lord chief-justice; whose great travails as I much commend, yet this same *plerophoria*, or overconfidence, doth always subject things to a great deal of chance.'

The full significance of these cautious expressions about confining and bounding the evidence, was not appreciated until the discovery of some further documents, relating to this dark subject, a few years ago. The expressions were then found to correspond with others, equally cautious, in Bacon's correspondence. Thus he talks of supplying the king with pretexts that 'might satisfy his honour for sparing the earl's life;' and in another place he says: 'It shall be my care so to moderate the matter of charging him, as it might make him not odious beyond the extent of mercy.'

The drift of all this is, in the first place, that as little of the real truth as possible should be divulged in the trial, and that Bacon and others should manage so as to let out enough to get a conviction and no more; hence the evidence is so fragmentary and unsatisfactory, that none but a tribunal prepared to be very easily satisfied could have formed any conclusion from it. In the second place, it was the king's object that Somerset should be assured all along that his life would be spared. The object of this certainly was to prevent him, in his despair, from uttering that secret, whatever it was, about which the king was so terribly alarmed. The reader may now expect some further elucidation of this part of the mystery.

In Sir Anthony Weldon's *Court and Character of King James* (p. 36), we have the following statement in reference to the trial:—

'And now for the last act, enters Somerset himself on the stage, who being told (as the manner is) by the lieutenant, that he must go next day to his trial, did absolutely refuse it, and said they should carry him in his bed; that the king had assured him he should not come to any trial—neither *durst* the king bring him to trial. This was in a high strain, and in a language not well understood by Sir George Moore, then lieutenant in Elwes's room—that made Moore quiver and shake. And however he was accounted a wise man, yet he was near at his wits' end.' This conversation had such an effect on the lieutenant, that though it was twelve o'clock at night, he sped instantly to Greenwich, to see the king. Then he 'bowneth at the back-stair, as if mad;' and Loweston, the Scotch groom, aroused from sleep, comes in great surprise to ask 'the reason of that distemper at so late a season.' Moore tells him, he must speak with the king. Loweston replies: 'He is quiet'—which, in the Scottish dialect, is fast asleep. Moore says: 'You must awake him.' We are then told that Moore was called in, and had a secret audience. 'He tells the king those passages, and requires to be directed by the king, for he was gone beyond his own reason to hear such bold and undutiful expressions from a faulty subject against a just sovereign. The king falls into a passion of tears: "On my soul, Moore, I wot not what to do! Thou art a wise man—help me in this great straight, and thou shalt find thou dost it for a thankful master;" with other sad expressions. Moore leaves the king in that passion, but assures him he will prove the utmost of his wit to serve his majesty—and was really rewarded with a suit worth to him L.1500.'

Moore returned to his prisoner, and told him, 'he had been with the king, found him a most affectionate master unto him, and full of grace in his intentions towards him; but,' he continued, 'to satisfy justice, you must appear, although you return instantly again without any further proceedings—only you shall know your enemies and their malice, though they shall have no power over you.' Somerset seemed satisfied; but Weldon states, that Moore, to render matters quite safe,

set two men, placed one on each side of Somerset during his trial, with cloaks hanging on their arms, 'giving them withal a peremptory order, if that Somerset did any way fly out on the king, they should instantly hood-wink him with that cloak, take him violently from the bar, and carry him away—for which he would secure them from any danger, and they should not want also a bountiful reward. But the earl finding himself over-reached, recollected a better temper, and went calmly on his trial, when he held the company until seven at night. But who had seen the king's restless motion all that day, sending to every boat he saw landing at the bridge, cursing all that came without tidings, would have easily judged all was not right, and there had been some grounds for his fears of Somerset's boldness; but at last one bringing him word that he was condemned, and the passages, all was quiet.'

Weldon solemnly states, that he obtained all these facts from Moore's own lips. He was, however, a sarcastic, discontented writer; and being what was called an upstart, he was supposed to have a malice against kings and courts. For such reasons as these, his narrative was distrusted until its fundamental character, at all events, was confirmed by the late discovery of a bundle of letters addressed by the king to Sir George Moore. The bundle was found carefully wrapped up, and appropriately endorsed, in the repositories of Sir George's descendant. The letters will be found printed in the eighteenth volume of the *Archæologia*, or transactions of the English Antiquarian Society. The following brief extracts from them may suffice for the present occasion—the spelling is modernised:—

'GOOD SIR GEORGE—I am extremely sorry that your unfortunate prisoner turns all the great care I have of him not only against himself, but against me also, as far as he can. I cannot blame you that ye cannot conjecture what this may be, for God knows it is only a trick of his idle brain, hoping thereby to shift his trial; but it is easy to be seen, that he would threaten me with laying an aspersion upon me of being in some sort accessory to his crime . . . Give him assurance in my name, that if he will yet, before his trial, confess cheerily unto the commissioners his guiltiness of this fact, I will not only perform what I promised by my last messenger both towards him and his wife, but I will enlarge it, according to the phrase of the civil law, &c. I mean not, that he shall confess if he be innocent, but ye know how evil likely that is; and of yourself ye may dispute with him what should mean his confidence now to endure a trial, when, as he remembers, that this last winter he confessed to the chief-justice that his cause was so evil likely as he knew no jury could acquit him. Assure him, that I protest upon my honour my end in this is for his and his wife's good. Ye will do well, likewise, of yourself, to cast out unto him, that ye fear his wife shall plead weakly for his innocency; and that ye find the commissioners have, ye know not how, some secret assurance that in the end she will confess of him—but this must only be as from yourself.'

That there was some secret of the divulgence of which the king was in the utmost terror, is thus beyond a doubt. What, then, was it? There are no means of deciding. James, it will be seen, hints to Moore, that it was a charge of accession to the murder of Sir Thomas Overbury. But, in the same letter, James lets us see that Moore himself did not know the exact secret; and we may fairly conjecture, that the hint was intended to put him on a wrong scent.

The earl and countess were permitted to live, spending a miserable existence with the fear of punishment hanging over them. The accounts given of the condition into which the once beautiful and too fascinating woman fell, are too disgusting to be repeated. There were many other proceedings connected with the charges for poisoning Sir Thomas Overbury, which

throw a curious light on the habits of the court, and especially on the criminal attempts to get rid of rivals and enemies by poison and sorcery. They may perhaps form a suitable subject for a separate paper.

A NIGHT IN A GERMAN WOOD.

So numerous are the forests here which grow in lofty and romantic sites, that a very extensive and interesting tour might be made, having them alone for its object. Such fascinating excursions should not, however, be embarked in without a guide, or a compass at the least; for these German woods are often very intricate, and run into one another in a most puzzling manner. This I learned to my cost a few months ago; and as a warning to other pedestrian tourists who may be as unpractised in such matters as I myself then was, I would now bespeak the reader's attention to my experiences of A Night in a German Wood.

Early in the autumn of the past year, whilst on a visit to a German friend who resides in one of the hilliest and best-wooded districts in Westphalia, on the confines of the classic Teutoburger Forest—after having been engaged nearly all the day in writing, I was tempted out by the freshness of the evening air and the glories of the setting sun, to take a turn in the park, which, by the by, is one of the handsomest and best laid out I have seen in any part of the continent, and a proof in itself that such things can be done—and well done too—even out of England. My intention was merely to stretch my cramped legs by a stroll to the southern angle of the demesne, and so be back in time for the quiet, early supper of the family. After moving along for a quarter of an hour under the shade of some fine old beech-trees, at the foot of a steep bank which overhangs the level meadow-ground, I came upon the outskirts of the plantations; and then turning sharp to the left, walked up along them till I had reached, as I thought, their extremity. Here, facing round, I began to turn my steps homeward; and by way of varying my route a little, struck into a shady path cut through the wood, which seemed to lead, as well as I could judge from my bearings, almost as directly back to the *schloss*—as all great country mansions here are called—as the one by which I had gone out. But after pushing rapidly along for some time in my dusky alley, I eventually emerged, much to my surprise, on an immense ploughed field, that, sloping gradually up to the spot where the sun had just set, seemed to terminate only with the visible horizon, which, however, from the very inclined angle at which the ground rose, was not very distant. Confident in the general correctness of my direction, I went on, right ahead, fancying I had only to cross this upland to be at home; but after floundering about for a good half-hour, and, in consequence of a water-course which cut it obliquely, being turned a little out of my straight direction, I found myself by moonlight on the verge of a patch of forest which was quite unknown to me. Such was my infatuation, however, and so firm my conviction of having taken correctly the relative bearings of the moon, which was now in her second quarter, and of the house, that I plunged unhesitatingly among the trees, expecting every moment to see the path through them open out upon some familiar spot in the demesne, or some portion of the surrounding country which I might have already perambulated by daylight. Though in utter darkness, from the close interweaving of the foliage, still, by raising my feet high, like a blind horse, to get over the inequalities of the way, and flourishing my stick perpetually around my head as I proceeded, to avoid coming in contact with any stray tree, or chance branch projecting into the pathway, I got prosperously through this portion of wood. But again I came out on something which was totally strange to me—a narrow valley, stretching, as well as I could

judge by the last glimmerings of twilight, to a considerable distance, flanked on each side by gloomy woods, about a quarter of a mile apart, and laid down in rye, which was nearly ready for the sickle, and dripping wet in the night-dew. Matters now began to look serious. I was completely at fault, and had entirely lost all confidence in my own pilotage. The moon had proved a faithless guide, or rather I had misconstrued her position; and my little pocket-compass was not forthcoming, thanks to the importunities of my youngest boy, who prizes it above all his own toys.

There was nothing for it now but to select that direction towards which the valley might seem slightly to descend; but this, in the imperfect twilight, was not very easily ascertained. With considerable hesitation, I decided at length on the right-hand turn, resolving to proceed till I should fall in with some rivulet, which might perhaps lead me eventually to the rapid trout-stream running close under my friend's windows, or else till I should come upon some path which might carry me into a field-road, and so perhaps to a village, where I should easily procure a guide home. So, with tottering knees and throbbing heart—for I was by this time nearly breathless—I continued to advance by the side of the standing corn, at such a pace as I could manage, uttering from time to time a lusty halloo, in hopes of making myself heard by some belated reaper or returning woodman. But my calls had no other effect than to awake the mocking echoes of the wood, or the mysterious and almost human shout of the screech-owl, and to leave me to a still more intense feeling of solitude, when these had died away. I found myself at length in a deep, hollow field-road, like those which abound in South Devon, and high overhead, on the lofty bank, stood a two-branched, weather-beaten finger-post, and a great rustic crucifix near it, looming large in the moonlight. Scrambling up the bank, with anxious peering eyes, I made out, by the dubious light of the moon, that one of the outstretched wooden arms bore, in rudely-cut letters, the name of the village beside which I was resident; and as its distance was stated, I found that, after all my windings and wanderings, I had still only got half a German mile, or about one league, astray! This was a very pleasant discovery; and accordingly I quickly wheeled about, and set off with renewed vigour at right angles to my previous line of march, having still good hopes of being at home before eleven o'clock at night, time enough to prevent any alarm on account of my absence.

The road soon, however, degenerated into a mere field-track, which, as the moon had disappeared behind clouds, just before her final setting, could only with difficulty be recognised by an occasional deep rut, felt by my stick in the soft ground; even this track at length forked out into two others—one penetrating into a wood on my right; the other opener, and with only scattered trees by its side, to the left. The latter seemed the most promising, and was accordingly selected, and followed for about ten minutes, when it, too, came upon the skirts of another wood in the opposite direction. It seemed, besides, as well as I could judge from some faint glimpses I now got of the surrounding country in a momentary gleam of moonlight, to be leading me wide of my goal: and I accordingly retraced my steps once more to where the road had divided, and taking the recently slighted right-hand path, dived in desperation in between the trees, amidst 'darkness that might be felt.' Walking steadily and quickly forward, during what seemed, in the deep gloom, a considerable time, I eventually emerged into 'the clear obscure,' the moon having at length set, and left the sky, and all such wanderers as myself, to the good offices of the stars. I was now on the opposite verge of the wood to that I had entered by, and found

myself by the side of a narrow corn-field, with another wooded hill on its further side, and heard, within hailing distance—more delightful than music to my ear—the grating sound of cart-wheels, which appeared to be going in an oblique, but nearly opposite direction to that in which I had just been moving. It was quite impossible to see anything so far off; but I hailed the presumed carter repeatedly, in my loudest and best German, asking my way.

'Follow on by the foot of the wood, and you'll get there in time,' was the reply, at length faintly heard in the distance, and the cart rumbled heavily away again, leaving me just as wise as before; for which was *head* and which was *foot* of the wood I knew no more than the child unborn. Yet I feared to dash through the intervening corn in the direction of the receding and already distant cart, neither knowing what the nature of the intermediate ground might prove, nor whether, supposing it practicable in the dark, such an infringement of rural property might not lead to disagreeable consequences, and in nowise further me in the attainment of the piece of knowledge which I stood so much in need of. So, I took on chance to my left hand, as the most distant from the finger-post I had fallen upon an hour and a half before.

The sound of the cart which long tingled in my ears, and the utter disappointment of my suddenly raised hopes, only rendered my sense of solitude and helplessness more intense. Indeed, I sometimes almost doubted whether the whole thing—cart and carter, or, rather, rumbling wheels and faint, chilling, distant voice—might not have been the delusion of my reeling brain, debilitated by overfatigue and long fasting (for every one knows the early hour at which a German dinner takes place); and on subsequent inquiry, I could not hear of any cart having passed in that quarter at all.

It was singular how long I wandered about, and every now and then in cultivated districts, without hearing a single human voice even in the earlier portion of the evening—nay, any sound whatever, save once or twice the fierce warning bark of a shepherd's dog, when I had inadvertently approached too near a sheepfold—the startling rush of some affrighted bird in the wood, flapping wildly up through the foliage—a distant village clock in some indefinite direction over the hill-top—or, finally, as on one occasion, a few remote shots, which I at first fancied might have been fired off by my friends to direct me homewards, but afterwards ascribed, more correctly, perhaps, to poachers in the woods. The manner in which the peasantry live here—in separate villages, built occasionally a good deal apart, and not in cottages scattered everywhere over the country, as with us—sufficiently accounts for this wide-spread silence.

Just as I was losing faith in the correctness of my present course, the chimes of a clock were distinctly heard, coming apparently over the top of the wooded hill on my left. I immediately turned into the wood once more, and strove to make a march directly through the trees in the direction of the sound, and right up the steep ascent, which was clothed by them to the summit. But this I soon found to be totally impracticable, in the absence of anything like a path or opening; for though I made my way well enough through the old trees, which stood far apart, and were pretty free from branches near the ground, yet towards the upper part of the hill, I got entangled in such a close-growing rising generation as it was almost impossible to penetrate. I was often almost in despair of being able to extricate myself even from my present entanglement, and to retrace my steps to the open ground below; in my exhausted condition, as it was already long past midnight, I was making up my mind to roost with the owls on the fork of a tree; and was even anticipating the possibility of becoming

a permanent scarecrow there, when my very bones would be concealed in the thicket from the anxious search of my friends.

It was under the influence of excessive fatigue, perhaps, and the relaxation of the will generally consequent thereon, that my resolution now at length seemed on the point of giving way; nay, the very attachment to life itself, on my own individual account, seemed fading, and a disinclination to continue the struggle farther appeared to be gradually creeping over me. I was becoming reconciled to what appeared inevitable, and could look upon my own probable fate almost as calmly as if it had been that of a stranger. I believe something very similar not unusually takes place, under the merciful disposition of Providence, in the death-bed, where debility is the chief feature of the case. After a few moments of repose and dreamy reverie, however, I roused myself from this state of apathy, and, influenced by a sense of duty, as well as by a sympathy for the feelings of those dearer than life itself, sprang to my feet once more, and struggled manfully out of the mesh of branches in which I had been entangled, till, after a few more violent efforts, I found myself getting into a rather open and more advanced growth of wood, and at length succeeded in working my way out—almost to the very spot in the meadow I had started from!

Whilst still within the wood, I had been favoured with some novel experiences there—novel, at least, to me, as it was my first night in such a position. Thus, almost every branch I grasped in the dark to help me onward seemed crowded with snails, which smashed aimlessly under my shuddering hand! Glowworms were sparkling in the underwood in such myriads as I never witnessed before, save once in an evening-walk near Salerno. The sense of utter solitude and unbroken silence within these gloomy woods was truly awful. From time to time, as I advanced, a casual opening in the branches exhibited a momentary glimpse of the sky, with all its thousand twinkling fires; and shooting-stars of intense brilliancy were darting across its dark, blue depths in almost as great frequency as in those celebrated days of August and November, when the path of our earth crosses the thickest showers of these celestial fireworks.

On regaining the meadow, I felt quite at a loss whither to turn, or what to attempt next. I had already been floundering about for some half-dozen hours, and been ignorant all the while whether each additional step were not only taking me a step further, not from home alone, but from the very habitations of men. Almost done up at length, and hopeless of extricating myself from my labyrinth till daylight should come to my aid, I was again for a moment inclined quietly to resign myself to what seemed my inevitable fate, and drop down to sleep on a bank of earth under a hedge by which I was standing, and so await the dawn. But the dank grass, the trees dropping with dew, the creeping autumnal fog, and increasing cold, made me pause, and feel that to sleep in my light summer dress under such circumstances was, if not to die, at least to contract, during the night, such disease as would render existence not worth the having—racking rheumatism for life, or fever, or inflammation, in some of their many forms, and endless consequences. So I resolved to keep moving as long as I had power to stir a limb, as this would give me a chance of maintaining the circulation and animal heat throughout the remaining hours of the night, if my strength would but hold out so long. Like a drowning man, I struck out once more for life; again I tried the field-road I had lately too rashly abandoned; floundered once more through its pools and its ruts; clambered again on its high banks, or moved along under the shadow of the wood by its side. At length, after scarcely half an hour's additional walking, my perseverance had its reward, as I found myself at the entrance of a

village, and heard, not far off, the busy clatter of some industrious flaxdressers, who were turning night into day, at their work. This proved to be the termination of my mishap; for the instructions I received enabled me to find my way home by three o'clock.

It was my amusement during several subsequent days, to endeavour by daylight to retrace accurately my midnight wanderings. I found I could not have walked less than twenty miles, though never at any time more than three distant from home. I had been incessantly in motion during nearly eight hours; and was at least thrice on right tracks, which, if they had been followed up steadily only a little longer, would have brought me to my quarters. The chiming of the old convent-bells, which I had mistaken for those of our own pretty little church, came really from the very opposite direction to what I fancied—the sound I heard being merely their echo, reflected to my ear from the wooded hill-side.

Thus, the proposition with which I started—namely, that German woods are not to be trifled with, or rashly entered without a guide or compass—is fully sustained by my own luckless experience. Much of the surrounding country was already well known to me, and in my various walks I had skirted along and even intersected some of these very woods; but the way in which they are parcelled out, for the supply of neighbouring, but unconnected villages with firewood, and the puzzling manner in which they are shuffled together when the estates of several proprietors run into one another at a given point, render it singularly difficult to steer through them even by day, and to the uninitiated, quite impracticable by night.

AN ADULT ADVENTURE IN LIVERPOOL.

LIVERPOOL has perhaps fewer relics of an archaeological nature than any other town in the United Kingdom; and this at first seems a little singular, when we remember that it is not without its place in the more romantic eras of our history, and that a castle of considerable strength once lent it protection. Its old castle, its towers, and the walls by which it was surrounded, have all been swept away by the busy crowds that now throng its thoroughfares. Even the former names of places have in most instances been altered, as if to obliterate all recollections and associations connected with its early history. Thus a row of houses, which a few years ago bore the not very euphonious name of Castle Ditch, from its having followed a portion of the line of the moat by which the fortress which once stood near it was surrounded, was changed into St George's Crescent, and many others underwent similar transmutations. But if the physical aspect of the place holds out few or no attractions to the antiquary, the moral one of its inhabitants, in so far as his favourite subject is concerned, is equally uninviting; for, taken as a whole, it would be difficult to find a population less influenced by, or interested in, such studies.

The only relic of the olden times which Liverpool has for a long time past retained, was a long, low, picturesque-looking thatched cottage in the small village of Everton (of *teffee* notoriety), which went by the name of Prince Rupert's Cottage, from its having been the head-quarters of that fiery leader when he besieged the town from the ridge on which the village is situated. But even this was swept away about six years ago by the proprietor, to allow a street which he had mapped out to abut upon the village at the point it occupied. The project did not succeed, and the outline of the contemplated street is all that as yet marks out the spot where this interesting object stood.

I confess to the soft impeachment of having been, at a very early period of my life, inoculated with the true Monkbarns enthusiasm, and I have always been a great admirer of that beautiful remark of Lord Bacon's, that 'antiquities may be considered as the planks of a wreck which wise and prudent men gather and preserve from the deluge of time.'

Some months ago, I was walking along what is called the Breck Road, leading out of the little village of Everton, of which I have been speaking, when my attention was arrested by a market-cross in a field on the opposite side of the road. I was somewhat surprised that it had escaped my notice when I formerly passed that way, and I immediately crossed over to examine it. It was formed, as all the English market-crosses are, of a series of flat steps, with an upright shaft in the centre, was built of the red sandstone of the district, and bore the appearance of great antiquity. The field was not far from what might be called the principal street of the village; and as I was aware that considerable changes had taken place of late years in the neighbourhood, it occurred to me as possible, that at one time the cross might have occupied the centre of a space on which the markets were held. My time, however, being limited, I was unable to make any immediate inquiries regarding it, but resolved to take an early opportunity of making myself acquainted with its early history, so as to rescue one interesting relic at least of the place from apparently a very undeserved obscurity. This opportunity did not present itself for some weeks; but at length it did occur, and I started for the place, to collect all the information, both traditional and otherwise, which I could regarding it.

On arriving at the spot, my surprise may be conceived, for it cannot be described, when, on looking at the field where it stood, I found that it had been removed, and all that remained to point out the place, was the bare mark on the grass of the spot which it had occupied. The consternation of Alladin, when he got up one fine morning and found that his gorgeous palace had vanished during the night, was hardly greater than mine on making this sad discovery; and, like him, I daresay, I rubbed my eyes in hopes that my visual organs had deceived me, but with as little success. On looking to the other side of the road, I observed a mason at work repairing the opposite wall with some very suspicious-looking stones, and I immediately crossed over, and commenced a categorical examination of the supposed delinquent. I inquired whether he could explain to me the cause of the removal of the ancient cross, which used to be in the field exactly opposite to where we were then standing; but he said that, although he was an old residenter in Everton, he had not even been aware of the existence of such an object. This I set down as an additional instance of the want of interest which the natives of the place take in archaeological subjects. He told me, however, that about three weeks previously, he had observed several men facing the wall opposite with large stones, which they brought apparently from some place close at hand; but that, having his own work to attend to, he had not bestowed any particular thought on the matter. He said the field was rented by a person for the purpose of cleaning carpets, and that he had no doubt the removal had been accomplished by his directions.

On stepping across the road, I found these suspicions completely realised; for there, resting on the top of the wall, were the time-honoured steps of the cross of my anxiety. Luckily for me, at least, the tenant was not at hand at the time, as in the state of excitement in which I was, I might have done or said something which I should afterwards have regretted. I had no alternative but to return to town, 'nursing my wrath to keep it warm,' and thinking over the best and most efficacious method in which I could accomplish the punishment of the aggressor, whoever he might be, and procuring the restoration of the cross in all its primitive simplicity. I thought of an article in the papers, into which all my caustic and sarcastic powers were to be concentrated and discharged on the head of the desecrator—then of calling on the lord of the manor, and mentioning the matter to him, so as, if possible, to carry his influence along with me, although I thought it quite probable that he might have sanctioned the spoliation, to save the expense of new stones for the repair of his tenant's wall. Under this latter impression, therefore, and previous to carrying either of these belligerent intentions into effect, I thought it would only be fair to give the obnoxious man an opportunity of explaining the

circumstances under which he had assumed—such an unwarranted responsibility. Accordingly, a short time afterwards, I again wended my way towards the field, determined to bring the matter in some way or other to a bearing, when I saw a very pleasant-looking man standing at the door of the house in which the carpet-cleansing operations are carried on. Supposing him to be the delinquent, I endeavoured to bridle my rising choler as much as possible, while I asked him whether he could tell me anything about the removal of the cross which had once stood in that field. With a gentle smile, which I thought at the time almost demoniac, he mildly replied, that he had removed it, *because the object for which he had erected it, about twelve months before*, had ceased to exist, and he had taken the stones to repair the wall close by where it had stood!

The shock which the nervous system of our worthy friend Monkbarns received when the exclamation of Edie Ochiltree fell upon his ear, of 'Pretorium here, pretorium there, I mind the biggin' o't,' was not greater than that which mine sustained on receiving this death-blow to all my hopes of rescuing this interesting relic of antiquity from its unmerited oblivion. Gulping down my mortification as I best could, I, in as indifferent a manner as I could assume, craved the liberty of inquiring what the circumstances were which had led to such a fanciful employment of his time. He told me that he had been a carpet-manufacturer in Oxfordshire, but had been unsuccessful in business, and had come here and set up his present establishment for the cleaning of the articles which he formerly manufactured; and that, wishing to add to his income by every legitimate means within his power, he had been supplied regularly with a quantity of Banbury cakes, for the sale of which he had erected a temporary wooden-hut in one corner of his field; that one morning early, about eighteen months ago, as he was lying awake in bed, the thought struck him, that as there were a great many large flat stones lying in a corner of the field, he would erect them, in front of the hut, into the form of the well-known cross of equestrian nursery-rhyme notoriety. He immediately rose, and, summoning his workmen, succeeded in making a very tolerable imitation of the world-wide-known cross; but that, after about twelve months' trial of his cake-speculation, finding it did not succeed, he gave it up; and removing the cross of which it was the sign, turned the stones to a more useful purpose.

Thus ended my day-dream connected with this *interesting relic*; and nothing, I am sure, but that indomitable enthusiasm which distinguishes all genuine disciples of the Monkbarns school, could have sustained me under my grievous disappointment.

'TWENTY-FOUR HOURS OF A SAILOR'S LIFE AT SEA.'

In the article with the above title, in No. 431, the pay of seamen is stated at from L.2, 10s. to L.3 a month; but this does not bring the information down to the latest date. At present, we are informed, the very best A. Bs. (able-bodied seamen) receive only from L.2 to L.2, 5s.; and 'ordinary' hands only from L.1, 10s. to L.1, 15s. In the navy, the pay is still less than in the merchant service, which is the reason why our best men so constantly desert to the American navy, where they obtain, on an average, about twelve dollars a month. It ought to be added, that when one of our ships is short of hands in a foreign port, these rates do not prevail. Captains are sometimes obliged to bid as high as L.6 a month, to make up their complement.

EXCESSIVE MODESTY.

D'Israeli tells us of a man of letters, of England, who had passed his life in constant study; and it was observed that he had written several folio volumes, which his modest fears would not permit him to expose to the eye even of his critical friends. He promised to leave his labours to posterity; and he seemed sometimes, with a glow on his countenance, to exult that they would not be unworthy of their acceptance. At his death, his sensibility took the alarm; he had the folios brought to his bed; no one could open them, for they were closely locked. At the sight of

his favourite and mysterious labours, he paused; he seemed disturbed in his mind, while he felt at every moment his strength decaying. Suddenly he raised his feeble hands by an effort of firm resolve, burnt his papers, and smiled as the greedy Vulcan licked up every page. The task exhausted his remaining strength, and he soon afterwards expired.

THE KHUNJUNEE.

[The little, disregarded wagtail of our own land, which we may frequently see wherever insects abound—on the green meadow, or by the margin of the brook—is the khunjune of the Hindoo, by whose romantic and fanciful mythology he has been made a holy bird, bearing on his breast the impression of Salagrama, the stone of Vishnoo, a sacred petrified shell. Protected by this prestige, the little creature ranges unmolested near the habitations of man, and may in this respect be styled the robin of the East. To Europeans in the East, this bird is also an object of interest, as being a precursor of the delightful cold season, the advent of which is anxiously looked for by every Anglo-Indian. The little khunjune makes his appearance in the early part of November, and departs as the hot season approaches—I think in March or April. The note of this little bird can hardly aspire to be called a song; I used, however, to think it a pleasing twitter. I paid particular attention to two khunjunes, which used to return every season and haunt our habitation: they would pick up insects from the pavement, and eat the crumbs with which they were plentifully supplied. I have watched them plucking themselves on the balustrade, while their sparkling black eyes glanced fearlessly and confidently in my face. When I now see a wagtail at home in Scotland, I cannot but look upon it as an old friend, reminding me of my departed youth, and recalling many soothing as well as mournful recollections.]

WELCOME to thee, sweet khunjune!

Which is thy best-loved home?—
Over the sea, in a far countrie,
Or the land to which thou art come?

What carest thou?—thou revelest here
In the bright and balmy air;
And again to regions far remote
Thou returnest—and summer is there!

Thou art sacred here, where the Brahmin tells
Of the godhead's seal impressed
By Vishnoo's hand—that thou bearest still
His gorget on thy breast.

And welcomed thou art, with grateful heart,
For well doth the Hindoo know,
That at thy approach the clouds disperse,
And temperate breezes blow.

Yet little he cares where thy sojourn hath been
So long, since he saw thee last;
Nor in what far land of storm or calm
The rainy months have passed.

But others there be, who think with me,
Thou hast been to that favoured land,
Which restores the bloom to the faded cheek,
And strength to the feeble hand.

And my children believe, that since thou wert here,
Thou hast compassed half the earth,
And that now thou hast come, like a thought in a dream,
From the land of their father's birth;

Bringing with thee the healthful breeze
That blows from the heath-clad hill,
And the breath of the primrose and gowan that bloom
On the bank by the babbling rill.

Then welcome to thee, little khunjune!
May thy presence a blessing confer;
Still of breezes cool, and returning health,
The faithful harbinger.

OLD INDIAN.

Printed and Published by W. and R. CHAMBERS, High Street, Edinburgh. Also sold by W. S. ORN, Amen Corner, London; D. N. CHAMBERS, 55 West Nile Street, Glasgow; and J. M'GLASHAN, 50 Upper Sackville Street, Dublin. Advertisements for Monthly Parts are requested to be sent to MAXWELL & Co., 31 Michols Lane, Lombard Street, London, to whom all applications respecting their insertion must be made.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 442. NEW SERIES.

SATURDAY, JUNE 19, 1852.

PRICE 1½d.

THE OLD HOUSE IN CRANE COURT.

THE roaring pell-mell of the principal thoroughfares of London is curiously contrasted with the calm seclusion which is often found at no great distance in certain lanes, courts, and passages, and the effect is not a little heightened when in these by-places we light upon some old building speaking of antique institutions or bygone habits of society. We lately had this idea brought strikingly before us on plunging abruptly out of Fleet Street into Crane Court, in search of the establishment known as the Scottish Hospital. We were all at once transferred into a quiet narrow street, as it might be called, full of printing and lithographic offices, tall, dark, and rusty, while closing up the further end stood a dingy building of narrow front, presenting an ornamental porch. A few minutes served to introduce us to a moderate-sized hall, having a long table in the centre, and an arm-chair at the upper end, while several old portraits graced the walls. It was not without a mental elevation of feeling, as well as some surprise, that we learned that this was a hall in which Newton had spent many an evening. It was, to be quite explicit, the meeting-place of the Royal Society from 1710 till 1782, and, consequently, during not much less than twenty years of the latter life of the illustrious author of the *Principia*, who, as an office-bearer in the institution, must have often taken an eminent place here. We were not, however, immediately in quest of the antiquities of the Royal Society. Our object was to form some acquaintance with the valuable institution which has succeeded to it in the possession of this house.

We must advert to a peculiarity of our Scottish countrymen, which can be set down only on the credit side of their character—their sympathy with each other when they meet as wanderers in foreign countries. Scotland is just a small enough country to cause a certain unity of feeling amongst the people. Wherever they are, they feel that Scotsmen should stand, as their proverb has it, *shoulder to shoulder*. The more distant the clime in which they meet, they remember with the more intensity their common land of mountain and flood, their historical and poetical associations, the various national institutions which ages have endeared to them; and the more disposed are they to take an interest in each other's welfare. This is a feeling in which time and modern innovations work no change, and it is one of old-standing.

When James VI. acceded to the throne of Elizabeth, he was followed southward by some of his favourite *scots*, and there was of course an end put to that exclusive system of the late monarch which had kept

down the number of Scotsmen in London, to what must now appear the astonishingly small one of fifty-eight. Perhaps some exaggerations have been indulged in with regard to the host of traders and craftsmen who went southward in the train of King James, but there can be no doubt, that it was considerable in point of numbers. But where wealth is sought for, there also, by an inevitable law of nature, is poverty. The better class of Scotchmen settled in London, soon found their feelings of compassion excited in behalf of a set of miserable fellow-countrymen who had failed to obtain employment or fix themselves in a mercantile position, and for whom the stated charities of the country were not available. Hence seems to have arisen, so early as 1613, the necessity for some system of mutual charity among the natives of Scotland in London. So far as can be ascertained, it was a handful of journeymen or hired artisans, who in that year associated to aid each other, and prevent themselves from becoming burdensome to strangers—an interesting fact, as evincing in a remote period the predominance of that spirit of independence for which the modern Scottish peasantry has been famed, and which even yet survives in some degree of vigour, notwithstanding the fatally counteractive influence of poor-laws. The funds contributed by these worthy men were put into a box, and kept there—for in those days there were no banks to take a fruitful charge of money—and at certain periods the contributors would meet, and see what they could spare for the relief of such poor fellow-countrymen as had in the interval applied to them. We have still a faint living image of this simple plan in the *boxes* belonging to certain trades in our Scottish towns, or rather the survivance of the phrase, for the money, we must presume, is now everywhere relegated to the keeping of the banks. The institution in those days was known as the *SCOTTISH BOX*, just as a money-dealing company came to be called a bank, from the table (*banco*) which it employed in transacting its business. From a very early period in its history, it seems to have taken the form of what is now called a Friendly Society, each person contributing an entrance-fee of 5s., and 6d. per quarter thereafter, so as to be entitled to certain benefits in the event of poverty or sickness. Small sums were also lent to the poorer members, without interest, and burial expenses were paid. We find from the records that, in 1638, when the company was twenty in number, and met in Lamb's Conduit Street, it allowed 20s. for a certain class of those of its members who had died of the plague, and 30s. for others. The whole affair, however, was then on a limited scale—the quarterly disbursements in 1661 amounting only to L.9, 4s.

Nevertheless, upwards of 300 poor Scotsmen, swept off by the pestilence of 1665-6, were buried at the expense of the Box, while numbers more were nourished during their sickness, without subjecting the parishes in which they resided to the smallest expense. We have not the slightest doubt, that not one of these people felt the bitterness of a dependence on alms. If not actually entitled to relief in consideration of previous payments of their own, they would feel that they were beholden only to their kindly countrymen. It would be like the members of a family helping each other. Humiliation could have been felt only, if they had had to accept of alms from those amongst whom they sojourned as strangers. Such is the way, at least, in which we read the character of our countrymen.

In the year 1665, the Box was exalted into the character of a corporation by a royal charter, the expenses attendant on which were disbursed by gentlemen named Kinnear, Allen, Ewing, Donaldson, &c. When they met at the Cross Keys in 'Coven Garden,' they found their receipts to be L.116, 8s. 5d. The character of the times is seen in one of their regulations, which imposed a fine of 2s. 6d. for every oath used in the course of their quarterly business. The institution was now becoming venerable, and, as usual, members began to exhibit their affection for it by presents. The Mr Kinnear just mentioned, conferred upon it an elegant silver cup. James Donaldson presented an ivory mallet or hammer, to be used by the chairman in calling order. Among the contributors, we find the name of Gilbert Burnet (afterwards Bishop) as giving L.1 half-yearly. They had an hospital erected in Blackfriars Street; but experience soon proved that confinement to a charity workhouse was altogether uncongenial to the feelings and habits of the Scottish poor, and they speedily returned to the plan of assisting them by small outdoor pensions, which has ever since been adhered to. In those days, no effort was made to secure permanency by a sunk fund. They distributed each quarter-day all that had been collected during the preceding interval. The consequence of this not very Scotsman-like proceeding was that, in one of those periods of decay which are apt to befall all charitable institutions, the Scottish Hospital was threatened with extinction; and this would undoubtedly have been its fate, but for the efforts of a few patriotic Scotsmen who came to its aid.

Through the help of these gentlemen, a new charter was obtained (1775), putting the institution upon a new and more liberal footing, and at the same time providing for the establishment of a permanent fund. Since then, through the virtue of the national spirit, considerable sums have been obtained from the wealthier Scotch living in London, and by the bequests of charitable individuals of the nation; so that the hospital now distributes about L.2200 per annum, chiefly in L.10 pensions to old people.* At the same time, a special bequest of large amount (L.76,495) from William

Kinloch, Esq., a native of Kincardineshire, who had realised a fortune in India, allows of a further distribution through the same channel of about L.1800, most of it in pensions of L.4 to disabled soldiers and sailors. Thus many hundreds of the Scotch poor of the metropolis may be said to be kept by their fellow-countrymen from falling upon the parochial funds, on which they would have a claim—a fact, we humbly think, on which the nation at large may justifiably feel some little pride. As part of the means of collecting this money, there is a festival twice a year, usually presided over by some Scottish nobleman, and attended by a great number of gentlemen connected with Scotland by birth or otherwise. A committee of governors meets on the second Wednesday of every month, to distribute the benefactions to the regular pensioners and casual applicants; and, in accordance with the national habits of feeling, this ceremony is always prefaced by divine service in the chapel, according to the simple practice of the Presbyterian Church. Since 1782, these transactions, as well as the general concerns of the institution, have taken place in the old building in Crane Court, where also the secretary has a permanent residence.

Such, then, is the institution which has succeeded to the possession of the dusky hall in which the Royal Society at one time assembled. It was with a mingled interest that we looked round it, reflecting on the presence of such men as Newton and Bradley of old, and on the many worthy deeds which had since been done in it by men of a different stamp, but surely not unworthy to be mentioned in the same sentence. A portrait of Queen Mary by Zuccherro, and one of the Duke of Lauderdale by Lely—though felt as reminiscences of Scotland—were scarcely fitted of themselves to ornament the walls; but this, of course, is as the accidents of gifts and bequests might determine. We felt it to be more right and fitting, that the secretary should be our old friend Major Adair, the son of that Dr Adair who accompanied Robert Burns on his visit to Glendevon in 1787. He is one of those men of activity, method, and detail, joined to unfailing good-humour, who are invaluable to such an institution. He is also, as might be expected, entirely a Scotsman, and evidently regards the hospital with feelings akin to veneration. Nor could we refrain from sympathising in his views, when we thought of the honourable national principle from which the institution took its rise, and by which it continues to be supported, as well as the practical good which it must be continually achieving. To quote his own words: 'From a view of the numbers relieved, it is evident, that while this institution is a real blessing to the aged, the helpless, the diseased, and the unemployed poor of Scotland, resident in London, Westminster, and the neighbourhood, extending to a circle of ten miles radius from the hall of the corporation, it is of incalculable benefit to the community at large, who, by means of this charity, are spared the pain of beholding so great an addition, as otherwise there would be, of our destitute fellow-creatures seeking their wretched pittance in the streets, liable to be taken up as vagrants and sent to the house of correction, and probably subjected to greater evils and disgrace.' The major has a pet scheme for extending the usefulness of the institution. It implies that individuals should make foundations of from L.300 to

* Note by an Englishman.—It is not one of the least curious particulars in the history of the Scottish Hospital, that it substantiates by documentary evidence the fact, that Scotsmen, who have gone to England, occasionally find their way back to their own country. It appears from the books of the corporation, that in the year ending 30th November 1850, the sum of L.30, 10s. 6d. was spent in 'passages' from London to Leith; and there is actually a corresponding society in Edinburgh to receive the *revenants*, and pass them on to their respective districts.

L.400 each, in order to produce pensions of L.10 a year; these to be in the care and dispensation of the hospital, and each to bear for ever the name of its founder; thus permanently connecting his memory with the institution, and insuring that once a year, at least, some humble fellow-countryman shall have occasion to rejoice that such a person as he once existed. The idea involves the gratification of a fine natural feeling, and we sincerely hope that it will be realised. And why, since we have said so much, should we hesitate to add the more general wish, that the Scottish Hospital may continue to enjoy an undiminished measure of the patronage of our countrymen? May it flourish for ever!

THE HUNCHBACK OF STRASBOURG.

In the department of the Bas-Rhin, France, and not more than about two leagues north of Strasbourg, lived Antoine Delessert, who farmed, or intended farming, his own land—about a ten-acre slice of 'national' property, which had fallen to him, nobody very well knew how, during the hurly-burly of the great Revolution. He was about five-and-thirty, a widower, and had one child, likewise named Antoine, but familiarly known as Le Bossu (hunchback)—a designation derived, like his father's acres, from the Revolution, somebody having, during one of the earlier and livelier episodes of that exciting drama, thrown the poor little fellow out of a window in Strasbourg, and broken his back. When this happened, Antoine, *père*, was a journeyman *ferblantier* (tinman) of that city. Subsequently, he became an active, though subordinate member of the local Salut Public; in virtue of which patriotic function he obtained *Les Près*, the name of his magnificent estate. Working at his trade was now, of course, out of the question. Farming, as everybody knows, is a gentlemanly occupation, skill in which comes by nature; and Citizen Delessert forthwith betook himself, with his son, to *Les Près*, in the full belief that he had stepped at once into the dignified and delightful position of the ousted aristocrat, to whom *Les Près* had once belonged, and whose haughty head he had seen fall into the basket. But envious clouds will darken the brightest sky, and the new proprietor found, on taking possession of his quiet, unencumbered domain, that property has its plagues as well as pleasures. True, there was the land, but not a plant, or a seed thereon or therein, nor an agricultural implement of any kind to work it with. The walls of the old rambling house were standing, and the roof, except in about a dozen places, kept out the rain with some success; but the nimble, unrespecting fingers of preceding patriots had carried off not only every vestige of furniture, usually so called, but coppers, cistern, pump, locks, hinges—nay, some of the very doors and window-frames! Delessert was profoundly discontented. He remarked to Le Bossu, now a sharp lad of some twelve years of age, that he was at last convinced of the entire truth of his cousin Boisadet's frequent observation—that the Revolution, glorious as it might be, had been stained and dishonoured by many shameful excesses; an admission which the son, with keen remembrance of his compulsory flight from the window, savagely endorsed.

'Peste!' exclaimed the new proprietor, after a lengthened and painful examination of the dilapidations, and general nakedness of his estate—'this is embarrassing. Citizen Destouches was right. I must raise money upon the property, to replace what those brigands have carried off. I shall require three thousand francs at the very least.'

The calculation was dispiriting; and after a night's lodging on the bare floor, damply enveloped in a few old sacks, the financial horizon did not look one whit less gloomy in the eyes of Citizen Delessert. Destouches, he sadly reflected, was an iron-fisted notary-public, who

lent money, at exorbitant interest, to distressed landowners, and was driving, people said, a thriving trade in that way just now. His pulse must, however, be felt, and money be obtained, however hard the terms. This was unmistakably evident; and with the conviction tugging at his heart, Citizen Delessert took his pensive way towards Strasbourg.

'You guess my errand, Citizen Destouches?' said Delessert, addressing a flinty-faced man of about his own age, in a small room of Numéro 9, Rue Béchard.

'Yes—money: how much?'

'Three thousand francs is my calculation.'

'Three thousand francs! You are not afraid of opening your mouth, I see. Three thousand francs!—humph! Security, ten acres of middling land, uncultivated, and a tumble-down house; title, *droit de guillotine*. It is a risk, but I think I may venture. Pierre Nadaud,' he continued, addressing a black-browed, sly, sinister-eyed clerk, 'draw a bond, secured upon *Les Près*, and the appurtenances, for three thousand francs, with interest at ten per cent.'

'Morbieu! but that is famous interest!' interjected Delessert, though timidly.

'Payable quarterly, if demanded,' the notary continued, without heeding his client's observation; 'with power, of course, to the lender to sell, if necessary, to reimburse his capital, as well as all accruing *dommages-intérêts*!'

The borrower drew a long breath, but only muttered: 'Ah, well; no matter! We shall work hard, Antoine and I.'

The legal document was soon formally drawn: Citizen Delessert signed and sealed, and he had only now to pouch the cash, which the notary placed upon the table.

'Ah ça!' he cried, eyeing the roll of paper proffered to his acceptance with extreme disgust. 'It is not in those *chiffons* of assignats, is it, that I am to receive three thousand francs, at ten per cent.?'

'My friend,' rejoined the notary, in a tone of great severity, 'take care what you say. The offence of depreciating the credit or money of the Republic is a grave one.'

'Who should know that better than I?' promptly replied Delessert. 'The paper-money of our glorious Republic is of inestimable value; but the fact is, Citizen Destouches, I have a weakness, I confess it, for coined money—*argent métallique*. In case of fire, for instance, it'—

'It is very remarkable,' interrupted the notary with increasing sternness—'it is very remarkable, Pierre' (Pierre was an influential member of the Salut Public), 'that the instant a man becomes a landed proprietor, he betrays symptoms of *incivisme*: is discovered to be, in fact, an *aristocq* at heart.'

'I an *aristocq*!' exclaimed Delessert, turning very pale; 'you are jesting, surely. See, I take these admirable assignats—three thousand francs' worth at ten per cent.—with the greatest pleasure. Oh, never mind counting among friends.'

'Pardon!' replied Destouches, with rigid scrupulosity. 'It is necessary to be extremely cautious in matters of business. Deducting thirty francs for the bond, you will, I think, find your money correct; but count yourself.'

Delessert pretended to do so, but the rage in his heart so caused his eyes to dance and dazzle, and his hands to shake, that he could scarcely see the figures on the assignats, or separate one from the other. He bundled them up at last, crammed them into his pocket, and hurried off, with a sickly smile upon his face, and maledictions, which found fierce utterance as soon as he had reached a safe distance, trembling on his tongue.

'Scélérat! coquin!' he savagely muttered. 'Ten per cent. for this moonshine money! I only wish— But never mind, what's sauce for the goose is sauce

for the gander. I must try and buy in the same way that I have been so charmingly sold.'

Earnestly meditating this equitable process, Citizen Delessert sought his friend Jean Souday, who lived close by the Fossé des Tanneurs (Tanners' Ditch.) Jean had a somewhat ancient mare to dispose of, which our landed proprietor thought might answer his purpose. Cocotte was a slight waif, sheared off by the sharp axe of the Place de la Révolution, and Souday could therefore afford to sell her cheap. Fifty francs *argent métallique* would, Delessert knew, purchase her; but with assignats, it was quite another affair. But, courage! He might surely play the notary's game with his friend Souday: that could not be so difficult.

'You have no use for Cocotte,' suggested Delessert modestly, after exchanging fraternal salutations with his friend.

'Such an animal is always useful,' promptly answered Madame Souday, a sharp, notable little woman, with a vinegar aspect.

'To be sure—to be sure! And what price do you put upon this useful animal?'

'Cela dépend'—replied Jean, with an interrogative glance at his helpmate.

'Yes, as Jean says, that depends—entirely depends'—responded the wife.

'Upon what, citoyenne?'

'Upon what is offered, parbleu! We are in no hurry to part with Cocotte; but money is tempting.'

'Well, then, suppose we say, between friends, fifty francs?'

'Fifty francs! That is very little; besides, I do not know that I shall part with Cocotte at all.'

'Come, come; be reasonable. Sixty francs! Is it a bargain?'

Jean still shook his head. 'Tempt him with the actual sight of the money,' confidentially suggested Madame Souday; 'that is the only way to strike a bargain with my husband.'

Delessert preferred increasing his offer to this advice, and gradually advanced to 100 francs, without in the least softening Jean Souday's obduracy. The possessor of the assignats was fain, at last, to adopt Madame Souday's iterated counsel, and placed 120 paper francs before the owner of Cocotte. The husband and wife instantly, as silently, exchanged with each other, by the only electric telegraph then in use, the words: 'I thought so.'

'This is charming money, friend Delessert,' said Jean Souday; 'far more precious to an enlightened mind than the barbarous coin stamped with effigies of kings and queens of the *ancien régime*. It is very tempting; still, I do not think I can part with Cocotte at any price.'

Poor Delessert ground his teeth with rage, but the expression of his anger would avail nothing; and, yielding to hard necessity, he at length, after much wrangling, became the purchaser of the old mare for 250 francs—in assignats. We give this as a specimen of the bargains effected by the owner of Les Près with his borrowed capital, and as affording a key to the bitter hatred he from that day cherished towards the notary, by whom he had, as he conceived, been so egregiously duped. Towards evening, he entered a wine-shop in the suburb of Robertsau, drank freely, and talked still more so, fatigue and vexation having rendered him both thirsty and bold. Destouches, he assured everybody that would listen to him, was a robber—a villain—a vampire blood-sucker, and he, Delessert, would be amply revenged on him some fine day. Had the loquacious orator been eulogising some one's extraordinary virtues, it is very probable that all he said would have been forgotten by the morrow, but the memories of men are more tenacious of slander and evil-speaking; and thus it happened that Delessert's vituperative and menacing eloquence on this occasion

was thereafter reproduced against him with fatal power.

Albeit, the now nominal proprietor of Les Près, assisted by his son and Cocotte, set to work manfully at his new vocation; and by dint of working twice as hard, and faring much worse than he did as a journeyman *ferblantier*, contrived to keep the wolf, if not far from the door, at least from entering in. His son, Le Bossu, was a cheerful, willing lad, with large, dark, inquisitive eyes, lit up with much clearer intelligence than frequently falls to the share of persons of his age and opportunities. The father and son were greatly attached to each other; and it was chiefly the hope of bequeathing Les Près, free from the usurious gripe of Destouches, to his boy, that encouraged the elder Delessert to persevere in his well-nigh hopeless husbandry. Two years thus passed, and matters were beginning to assume a less dreary aspect, thanks chiefly to the notary's not having made any demand in the interim for the interest of his mortgage.

'I have often wondered,' said Le Bossu one day, as he and his father were eating their dinner of *soupe aux choux* and black bread, 'that Destouches has not called before. He may now as soon as he pleases, thanks to our having sold that lot of damaged wheat at such a capital price: corn must be getting up tremendously in the market. However, you are ready for Destouches' demand of six hundred francs, which it is now.'

'Parbleu! quite ready; all ready counted in those charming assignats; and that is the joke of it. I wish the old villain may call or send soon'—

A gentle tap at the door interrupted the speaker. The son opened it, and the notary, accompanied by his familiar, Pierre Nadaud, quietly glided in.

'Talk of the devil,' growled Delessert audibly, 'and you are sure to get a whisk of his tail. Well, messieurs,' he added more loudly, 'your business?'

'Money—interest now due on the mortgage for three thousand francs,' replied M. Destouches with much suavity.

'Interest for two years,' continued the sourly-sardonic accents of Pierre Nadaud; 'six hundred francs precisely.'

'Very good, you shall have the money directly.' Delessert left the room; the notary took out and unclasped a note-book; and Pierre Nadaud placed a slip of *papier timbré* on the dinner-table, preparatory to writing a receipt.

'Here,' said Delessert, re-entering with a roll of soiled paper in his hand, 'here are your six hundred francs, well counted.'

The notary reclasped his note-book, and returned it to his pocket; Pierre Nadaud resumed possession of the receipt paper.

'You are not aware, then, friend Delessert,' said the notary, 'that creditors are no longer compelled to receive assignats in payment?'

'How? What do you say?'

'Pierre,' continued M. Destouches, 'read the extract from *Le Bulletin des Lois*, published last week.' Pierre did so with a ringing emphasis, which would have rendered it intelligible to a child; and the unhappy debtor fully comprehended that his paper-money was comparatively worthless! It is needless to dwell upon the fury manifested by Delessert, the cool obduracy of the notary, or the cynical comments of the clerk. Enough to say, that M. Destouches departed without his money, after civilly intimating that legal proceedings would be taken forthwith. The son strove to soothe his father's passionate despair, but his words fell upon unheeding ears; and after several hours passed in alternate paroxysms of stormy rage and gloomy reverie, the elder Delessert hastily left the house, taking the direction of Strasbourg. Le Bossu watched his father's retreating figure from the door until it was lost in the clouds of blinding snow that was rapidly

falling, and then sadly resumed some indoor employment. It was late when he retired to bed, and his father had not then returned. He would probably remain, the son thought, at Strasbourg for the night.

The chill, lead-coloured dawn was faintly struggling on the horizon with the black, gloomy night, when Le Bossu rose. Ten minutes afterwards, his father strode hastily into the house, and threw himself, without a word, upon a seat. His eyes, the son observed, were blood-shot, either with rage or drink—perhaps both; and his entire aspect wild, haggard, and fierce. Le Bossu silently presented him with a measure of *vin ordinaire*. It was eagerly swallowed, though Delessert's hand shook so that he could scarcely hold the pewter flagon to his lips.

'Something has happened,' said Le Bossu presently.

'Morbleu!—yes. That is,' added the father, checking himself, 'something *might* have happened, if— Who's there?'

'Only the wind shaking the door. What *might* have happened?' persisted the son.

'I will tell you, Antoine. I set off for Strasbourg yesterday, to see Destouches once again, and entreat him to accept the assignats in part-payment at least. He was not at home. Marguerite, the old servant, said he was gone to the cathedral, not long since reopened. Well, I found the usurer just coming out of the great western entrance, heathen as he is, looking as pious as a pilgrim. I accosted him, told my errand, begged, prayed, stormed! It was all to no purpose, except to attract the notice and comments of the passers-by. Destouches went his way, and I, with fury in my heart, betook myself to a wine-shop—Le Brun's. He would not even change an assignat to take for what I drank, which was not a little; and I therefore owe him for it. When the gendarmes cleared the house at last, I was nearly crazed with rage and drink. I must have been so, or I should never have gone to the Rue Bécard, forced myself once more into the notary's presence, and—and—'

'And what?' quivered the young man, as his father abruptly stopped, startled as before into silence by a sudden rattling of the crazy door. 'And what?'

'And abused him for a flinty-hearted scoundrel, as he is. He ordered me away, and threatened to call the guard. I was flinging out of the house, when Marguerite twitted me by the sleeve, and I stepped aside into the kitchen. "You must not think," she said, "of going home on such a night as this." It was snowing furiously, and blowing a hurricane at the time. "There is a straw pallet," Marguerite added, "where you can sleep, and nobody the wiser." I yielded. The good woman warmed some soup, and the storm not abating, I lay down to rest—to rest, do I say?' shouted Delessert, jumping madly to his feet, and pacing furiously to and fro—'the rest of devils! My blood was in a flame; and rage, hate, despair, blew the consuming fire by turns. I thought how I had been plundered by the mercenary ruffian sleeping securely, as he thought, within a dozen yards of the man he had ruined—sleeping securely just beyond the room containing the *secrétaire* in which the mortgage-deed of which I had been swindled was deposited—'

'Oh, father!' gasped the son.

'Be silent, boy, and you shall know all! It may be that I dreamed all this, for I think the creaking of a door, and a stealthy step on the stair, awoke me; but perhaps that, too, was part of the dream. However, I was at last wide awake, and I got up and looked out on the cold night. The storm had passed, and the moon had temporarily broken through the heavy clouds by which she was encompassed. Marguerite had said I might let myself out, and I resolved to depart at once. I was doing so, when, looking round, I perceived that the notary's office-door was ajar. Suddenly a demon whispered, that although the law was

restored, it was still blind and deaf as ever—could not see or hear in that dark silence—and that I might easily baffle the cheating usurer after all. Swiftly and softly, I darted towards the half-opened door—entered. The notary's *secrétaire*, Antoine, was wide open! I hunted with shaking hands for the deed, but could not find it. There was money in the drawers, and I—I think I should have taken some—did perhaps, I hardly know how—when I heard, or thought I did, a rustling sound not far off. I gazed wildly round, and plainly saw in the notary's bedroom—the door of which, I had not before observed, was partly open—the shadow of a man's figure clearly traced by the faint moonlight on the floor. I ran out of the room, and out of the house, with the speed of a madman, and here—here I am!' This said, he threw himself into a seat, and covered his face with his hands.

'That is a chink of money,' said Le Bossu, who had listened in dumb dismay to his father's concluding narrative. 'You had none, you said, when at the wine-shop.'

'Money! Ah, it may be as I said—Thunder of heaven!' cried the wretched man, again fiercely springing to his feet, 'I am lost!'

'I fear so,' replied a commissaire de police, who had suddenly entered, accompanied by several gendarmes—'if it be true, as we suspect, that you are the assassin of the notary Destouches.'

The assassin of the notary Destouches! Le Bossu heard but these words, and when he recovered consciousness, he found himself alone, save for the presence of a neighbour, who had been summoned to his assistance.

The *procès verbal* stated, in addition to much of what has been already related, that the notary had been found dead in his bed, at a very early hour of the morning, by his clerk Pierre Nadaud, who slept in the house. The unfortunate man had been stifled, by a pillow it was thought. His *secrétaire* had been plundered of a very large sum, amongst which were Dutch gold ducats—purchased by Destouches only the day before—of the value of more than 6000 francs. Delessert's mortgage-deed had also disappeared, although other papers of a similar character had been left. Six crowns had been found on Delessert's person, one of which was clipped in a peculiar manner, and was sworn to by an *épiciér* as that offered him by the notary the day previous to the murder, and refused by him. No other portion of the stolen property could be found, although the police exerted themselves to the utmost for that purpose.

There was, however, quite sufficient evidence to convict Delessert of the crime, notwithstanding his persistent asseverations of innocence. His known hatred of Destouches, the threats he had uttered concerning him, his conduct in front of the cathedral, Marguerite's evidence, and the finding the crown in his pocket, left no doubt of his guilt, and he was condemned to suffer death by the guillotine. He appealed of course, but that, everybody felt, could only prolong his life for a short time, not save it.

There was one person, the convict's son, who did not for a moment believe that his father was the assassin of Destouches. He was satisfied in his own mind, that the real criminal was he whose step Delessert had dreamed he heard upon the stair, who had opened the office-door, and whose shadow fell across the bedroom floor; and his eager, unresting thoughts were bent upon bringing this conviction home to others. After awhile, light, though as yet dim and uncertain, broke in upon his filial task.

About ten days after the conviction of Delessert, Pierre Nadaud called upon M. Huguet, the procureur-général of Strasbourg. He had a serious complaint to make of Delessert, *filis*. The young man, chiefly, he supposed, because he had given evidence against his father, appeared to be nourishing a monomaniacal

hatred against him, Pierre Nadaud. 'Wherever I go,' said the irritated complainant, 'at whatever hour, early in the morning and late at night, he dogs my steps. I can in no manner escape him, and I verily believe those fierce, malevolent eyes of his are never closed. I really fear he is meditating some violent act. He should, I respectfully submit, be restrained—placed in a *maison de santé*, for his intellects are certainly unsettled; or otherwise prevented from accomplishing the mischief I am sure he contemplates.'

M. Huguet listened attentively to this statement, reflected for a few moments, said inquiry should be made in the matter, and civilly dismissed the complainant.

In the evening of the same day, Le Bossu was brought before M. Huguet. He replied to that gentleman's questioning by the avowal, that he believed Nadaud had murdered M. Destouches. 'I believe also,' added the young man, 'that I have at last hit upon a clue that will lead to his conviction.'

'Indeed! Perhaps you will impart it to me?'

'Willingly. The property in gold and precious gems carried off has not yet been traced. I have discovered its hiding-place.'

'Say you so? That is extremely fortunate.'

'You know, sir, that beyond the Rue des Vignes there are three houses standing alone, which were gutted by fire some time since, and are now only temporarily boarded up. That street is entirely out of Nadaud's way, and yet he passes and repasses there five or six times a day. When he did not know that I was watching him, he used to gaze curiously at those houses, as if to notice if they were being disturbed for any purpose. Lately, if he suspects I am at hand, he keeps his face determinedly away from them, but still seems to have an unconquerable hankering after the spot. This very morning, there was a cry raised close to the ruins, that a child had been run over by a cart. Nadaud was passing: he knew I was close by, and violently checking himself, as I could see, kept his eyes fixedly averted from the place, which I have no longer any doubt contains the stolen treasure.'

'You are a shrewd lad,' said M. Huguet, after a thoughtful pause. 'An examination shall at all events take place at nightfall. You, in the meantime, remain here under surveillance.'

Between eleven and twelve o'clock, Le Bossu was again brought into M. Huguet's presence. The commissary who arrested his father was also there. 'You have made a surprising guess, if it be a guess,' said the procureur. 'The missing property has been found under a hearth-stone of the centre house.' Le Bossu raised his hands, and uttered a cry of delight. 'One moment,' continued M. Huguet. 'How do we know this is not a trick concocted by you and your father to mislead justice?'

'I have thought of that,' replied Le Bossu calmly. 'Let it be given out that I am under restraint, in compliance with Nadaud's request; then have some scaffolding placed to-morrow against the houses, as if preparatory to their being pulled down, and you will see the result, if a quiet watch is kept during the night.' The procureur and commissary exchanged glances, and Le Bossu was removed from the room.

It was verging upon three o'clock in the morning, when the watchers heard some one very quietly remove a portion of the back-boarding of the centre house. Presently, a closely-muffled figure, with a dark-lantern and a bag in his hand, crept through the opening, and made direct for the hearth-stone; lifted it, turned on his light slowly, gathered up the treasure, crammed it into his bag, and murmured with an exulting chuckle as he reclined the lantern and stood upright: 'Safe—safe, at last!' At the instant, the light of half a dozen lanterns flashed upon the miserable wretch, revealing the stern faces of as many gendarmes. 'Quite safe, M. Pierre Nadaud!' echoed their leader. 'Of that

you may be assured.' He was unheard: the detected culprit had fainted.

There is little to add. Nadaud perished by the guillotine, and Delessert was, after a time, liberated. Whether or not he thought his ill-gotten property had brought a curse with it, I cannot say; but, at all events, he abandoned it to the notary's heirs, and set off with Le Bossu for Paris, where, I believe, the sign of 'Delessert et Fils, Ferblantiers,' still flourishes over the front of a respectably furnished shop.

PHILOSOPHY OF THE SHEARS.

THE vestiarian profession has always been ill-treated by the world. Men have owed much, and in more senses than one, to their tailors, and have been accustomed to pay their debt in sneers and railleries—often in nothing else. The stage character of the tailor is stereotyped from generation to generation; his goose is a perennial pun; and his habitual melancholy is derived to this day from the flatulent diet on which he will persist in living—cabbage. He is effeminate, cowardly, dishonest—a mere fraction of a man both in soul and body. He is represented by the thinnest fellow in the company; his starved person and frightened look are the unfailing signals for a laugh; and he is never spoken to but in a gibe at his trade:

'Thou liest, thou thread,

Thou thimble,

Thou yard, three-quarters, half-yard, quarter, nail;

Away thou rag, thou quantity, thou remnant;

Or I shall so bemet thee with thy yard,

As thou shalt think on prating while thou liv'st!'

All this is not a very favourable specimen of the way in which the stage holds the mirror up to nature. We may suppose that a certain character of effeminacy attached to a tailor in that olden time when he was the fashioner for women as well as men; but now that he has no professional dealings with the fair sex but when they assume masculine 'habits,' it is unreasonable to continue the stigma. In like manner, when the cloth belonged to the customer, it was allowable enough to suspect him of a little amiable weakness for cabbage; but now that he is himself the clothier, the joke is pointless and absurd. Tailors, however, can afford to laugh, as well as other people, at their conventional double—or rather *ninth*, for at least in our own day they have wrought very hard to elevate their calling into a science. The period of lace and frippery of all kinds has passed away, and this is the era of simple form, in which sartorial genius has only cloth to work upon as severely plain as the statuary's marble. It is true, we ourselves do not understand the 'anatomical principles' on which the more philosophical of the craft proceed, nor does our scholarship carry us quite the length of their Greek (?) terminology; but we acknowledge the result in their workmanship, although we cannot trace the steps by which it is brought about.

Very different is the plan now from what it was in the days of Shemus nan Snachad, James of the Needle, hereditary tailor to Vich Ian Vohr, when men were measured as classes rather than as individuals, and when a cutter had only to glance at the customer to ascertain to which category he belonged.

'You know the measure of a well-made man? Two double nails to the small of the leg'—

'Eleven from haunch to heel, seven round the waist. I give your honour leave to hang Shemus, if there's a pair of shears in the Highlands that has a boulder sneek than her ain at the *camadh an truais* (shape of the trows). And so the thing was done, without tape or figures, without a word of Greek or anatomy! However, the anatomical tailors we shall not meddle with for the present, because we do not understand their science; nor with the Greek tailors, because we fear to take the

liberty; nor with the Hebrew tailors, because we are only a Gentile ourselves. Our object is to draw attention to the doings of an individual who interferes with no science but his own, and who patronises exclusively his mother-tongue, which is not Hebrew, but broad Scotch.

This individual is Mr Macdonald, a near neighbour of ours, who, about eighteen years ago, listened with curiosity, but not with dread, to the clamorous pretensions of the craft to which he belonged. At that time, every man had a 'new principle' of his own for the sneek of the shears, some theoretical mode of cutting, which was to make the coat fit like the skin. Our neighbour, who had a practical and mechanical, rather than a speculative head, resolved not to be behind in the race of competition, but to proceed in a different way. 'It is all very well,' thought he, 'to talk of principles and theories; but with the requisite apparatus, the human figure may be measured as accurately as a block of stone;' and accordingly he set to work, not to invent a theory, but to construct a machine. This machine, though exhibited some time ago in the School of Arts, and received with great favour, we happened not to hear of till a few days ago; but a visit to our neighbour puts it now in our power to report that his apparatus does much more, as we shall presently explain, than measure a customer.

The machine consists of three perpendicular pieces of wood, the centre one between six and seven feet high, with a plinth for the measuree to stand upon. The wood is marked from top to bottom with inches and parts of an inch, and is furnished with slides, fitting closely, but movable at the pleasure of the operator. When the customer places himself upon this machine, standing at his full height, he has much the appearance of a man suffering the punishment of crucifixion, only his arms, instead of being extended, hang motionless by his sides, with the fingers pointed. A slide is now run up between the victim's legs, to give the measurement of what is technically called the fork; while others mark in like manner upon the inch scale, the position of the knees, hips, tips of the fingers, shoulder, neck, head, &c. When the operator is satisfied that he has thus obtained the accurate admeasurement of the figure, in its natural position when standing erect, the gentleman steps from the machine, and turning round, sees an exact diagram, in wood, of his own proportions.

This instrument, it will be seen, is very well adapted for the object for which it was intended; but it would, nevertheless, have escaped our inspection but for the other purposes of observation to which it has been applied by the ingenious inventor. He has measured in all about 5000 adults, registering in a book the measurement of each, with the names written by themselves. Among the autographs, we find that of Sir David Wilkie in the neighbourhood of the names of half a dozen American Indians. Here would be a new branch of inquiry for those who are addicted to the study of character through the handwriting. With such abundant materials before them, they would doubtless be able to determine the height and general proportions of their unseen correspondents. In the article of height, many men correspond to the minutest portion of an inch; but in the other proportions of the figure, it would seem that no two human beings are alike. So great is the disparity in persons of the same height, that the trunk of an individual of five feet and a half, is occasionally found to be as long as that of a man of six feet. In fact, Mr Macdonald, in an early period of his measurements, was so confounded by the difference in the proportions, that he at once came to the conclusion, that our population is made up of mixed tribes of mankind.

In the midst of all this diversity, the question was, What were the proper proportions? or, in other words, What proportions constituted a handsome figure? and

here our vestiarian philosopher was for a long time at a loss. At length, however, he took 300 measurements, without selection, including the length of the trunk, of the head and neck, and of the fork, and adding them all together, struck the average: from which it resulted, that the average head and neck gives $10\frac{1}{2}$ inches; trunk, 25 inches; and fork, 32 inches; making the whole figure, from the crown of the head to the sole of the shoe, 5 feet $7\frac{1}{2}$ inches. The word we have italicised is the drawback: a tailor measures with the shoes on; and Mr Macdonald can only approximate to the truth when he deducts half an inch for the sole, and declares the average height of our population to be five feet seven inches. On this basis, however, he constructed a scale of beauty applying to all heights: If a man of 5 feet 7 inches give $10\frac{1}{2}$ inches for head and neck, 25 for trunk, and $31\frac{1}{2}$ for fork, what should another give, of 6 feet, or any other height? The approximation of a man's actual measurement to this rule of three determines his pretensions in the way of symmetry; and the inventor of the *shibboleth* has found it so far to answer, that a figure coming near the rule invariably pleases the eye, and gives the assurance of a handsome man. Independently of this advantage, a man of such proportions has great strength, and is able to withstand the fatigue of violent exercise for a longer period than one less symmetrically formed.

The term 'adult,' however, used by Mr Macdonald to designate those he measured, is not satisfactory—it does not inform us that the persons measured had reached their full development; for men continue to grow, as has been shewn by M. Quetelet, even after twenty-five. The height given, notwithstanding—five feet seven inches—in all probability approximates pretty closely to the true average; and the very different result shewn in Professor Forbes's measurements in the University must be set pretty nearly out of the question. The number of Scotsmen measured by the professor was 523 in all; but these were of eleven different ages, from fifteen to twenty-five, all averaged separately; and supposing the number of each age to have been alike, this would give less than fifty of the age of twenty-five—the average height of whom was 69.3 inches. But independently of the smallness of the number, the professor's customers were volunteers, and it is not to be supposed that under-sized persons would put themselves forward on such an occasion. It may be added, that even the height of the boot-heels of young collegians of twenty-five would tend to falsify the average.

Men do not only differ in their proportions from other men, but from themselves. The arms and legs may be paired, but they are not matched, and in every respect one side of the body is different from the other: the eyes are not set straight across the face, neither is the mouth; the nose is inclined to one side; the ears are of different sizes, and one is nearer the crown of the head than the other; there are not two fingers, nor two nails on the fingers, alike, and the same disagreement runs through the whole figure. This, however, is so common an observation, that we should not have thought it necessary to mention it, but for the bearing the facts given by our statist have upon the common theory by which the irregularity is sought to be accounted for. This declares, that use is the cause of the greater growth of one limb, &c.: that the right hand, for instance, is larger than the left, because it is in more active service. It appears, however, that although the left limbs are in general smaller, this is not, as it is usually supposed, invariably the case; while the ears and eyes, that are used indiscriminately, present the same relative difference of size. We do not, therefore, make our own proportions in this respect: we come into the world with them, and our occupations merely exaggerate a natural defect. An idle man will have one arm half an inch longer than

the other; while a woman, who has been accustomed in early years to carry a child, exhibits a difference amounting sometimes to an inch and a half.

When these facts were first mentioned to us, we looked with some curiosity at the machine from which we had just stepped out; and there we found an illustration of them not highly flattering to our self-esteem. Knees, hips, shoulders, ears, all were so ill-assorted, that it seemed as if Nature had been actually trying her 'prentice hand upon our peculiar self. It was in vain to bethink ourselves of the physical eccentricities of the distinguished men of other times:

'Ammon's great son one shoulder had too high;
Such Ovid's nose, and, sir, you have an eye!—

we might have gone through the whole inventory of the figure, and concluded the quotation:

'Go on, obliging creatures, make me see
All that disgraced my betters met in me.
Say, for my comfort, languishing in bed,
Just so immortal Maro held his head;
And when I die, be sure you let me know—
Great Homer died three thousand years ago!'

What we had seen, however, was only the length of the figure; but we were informed by our philosophic tailor, that the limbs, &c., are likewise irregularly placed as regards breadth. The trunk of the body is of various shapes, which he distinguishes as the oval, the circular, and the flat. The first has the arms placed in the middle; in the second, they are more towards the back, and relatively long; and in the third, more towards the front, and relatively short. The length of the forearm should be the length of the lower part of the leg, and if either longer or shorter, the difference appears in the walk. If shorter, the walk is a kind of waddle, the elbows inclining outwards; if longer, it is distinguished by a swinging motion, as if the person carried weights in his hands. If the circumference of the body, measured with an inch-tape just below the shoulders, be smaller than the circumference of the hips, the person will rock in walking, and plant his feet heavily upon the ground. If greater, so that the chief weight is above the limbs, the step will be light, as is familiarly seen in corpulent men, whose delicate mode of walking we witness with ever-recurring surprise. If the shoulders slope downwards, with the spine bending inwards, the individual 'cannot throw a stone, or handle firearms with dexterity.' When inclined forwards, and well relieved from the body, he may be a proficient in these exercises. A peculiarity in walking is given by the size of the head and neck being out of proportion; and an instance is mentioned of a man being discharged from the army, on account of his conformation rendering it impossible for him to keep his head steady.

All these are curious and suggestive particulars. It is customary to refer awkwardness of manner to bad habit, and such diseases as consumption either to imprudence or hereditary taint; but it may be doubted whether taints are not mainly the result of original conformation. Habit and imprudence may doubtless aggravate the evil, just as exercise may enlarge a member of the body; but it is nature which sows the seeds of decay in her own productions. Physically, the child is a copy of the parents, even to their peculiarities of gait; and these peculiarities would seem to depend on the correct or incorrect balance of the members of the body. When the conformation is of a kind which interferes with the play of the lungs, the same transmission of course takes place, and consumption may be the fatal inheritance. If the arrangement of the parts were perfect, it may be doubted—for symmetry is the basis of health as well as beauty—whether we should ever hear of such a thing as 'taint in the blood.' If this theory were to gain ground, it would simplify much the practice of medicine; for the disease would

stand in visible and tangible presence before the eye, and the employment of inventions, to counteract and finally conquer the eccentricities of nature, would be governed by science, and thus relieved from the suspicion of quackery, which at present more or less attaches to it. To pursue these speculations, however, would lead us too far; and before concluding, we must find room for a few more of our practical philosopher's observations.

All good mechanics, it seems, have large hands and thick and short fingers; which is pretty nearly the conclusion arrived at by D'Arpentigny in *La Chirognomonie*, although the captain adds, that the hands must be *en spatule*—that is to say, with the end of the fingers enlarged in the form of a spatula. The hand is generally the same breadth as the foot: a fact recognised by the country people, who, when buying their shoes at fairs—which were the usual mart—might have been seen thrusting in their hand to try the breadth, when they had ascertained that the length was suitable. A short foot gives a mincing walk, while a long one requires the person to bring his body aplomb with the foot before taking the step, which thus resembles a stride. Good dancers have the limbs short as compared with the body, which has thus the necessary power over them; but if too short, there is a deficiency of dexterity in the management of the feet.

In conclusion, it will be seen, we think, that there is much to be learned even in the business of the shears. There is no trade whatever which will not afford materials for thought to an intelligent man, and thus enlarge the mind and elevate the character.

THE NIGHTINGALE:

A MUSICAL QUESTION.

Is the song of the nightingale mirthful or melancholy? is a question that has been discussed so often, that anything new on the subject might be considered superfluous, were it not that the very fact of the discussion is in itself a curiosity worthy of attention. The note in dispute was heard with equal distinctness by Homer and Wordsworth; and indeed there are few poets of any age or country who have not, at one time or other in their lives, had the testimony of their own ears as to its character. Whence, then, this difference of opinion? Listen to Thomson's unqualified assertion, given with the seriousness of an affidavit:

—'all abandoned to despair, she sings
Her sorrows through the night, and on the bough
Sole sitting still at every dying fall
Takes up again her lamentable strain
Of winding wo; till wide around the woods
Sigh to her song and with her wail resound.'

Then Homer in the *Odyssey*, through Pope's paraphrase:

'Sad Philomel, in bowery shades unseen,
To vernal airs attunes her varied strains.'

Virgil, as rendered by Dryden:

—'she supplies the night with mournful strains
And melancholy music fills the plains.'

Milton, too:

—'Philomel will deign a song
In her sweetest, saddest plight,
Smoothing the rugged brow of night,
While Cynthia checks her dragon yoke
Gently o'er the custom'd oak:
Sweet bird, that shun'st the noise of folly—
Most musical, most melancholy.'

And again in *Comus*:

—'the love-lorn nightingale
Nightly to thee her sad song mourneth well.'

And Shakspeare makes his poor banished Valentine congratulate himself, that in the forest he can

—'to the nightingale's complaining note
Tune his distresses and record his wo.'

We might go on much longer in this strain. We might give, likewise, the mythological cause assigned for the imputed melancholy, and add that some, not content with this, represent the bird as leaning its breast against a thorn—

'To aggravate the inward grief,
Which makes its music so forlorn.'

But we would rather pause to admit candidly, that two of the above witnesses might be challenged—Virgil and Thomson; who indeed should be counted but as one, for the author of the *Seasons*, in the lines quoted, has translated, though not so closely as Dryden, from the *Georgics* of the Latin poet. If you will read the passage—it matters not whether in Virgil, Dryden, or Thomson—you will perceive that it is a special occurrence that is spoken of: no statement whatever is made as to the character of the nightingale's ordinary song. Thomson, in the course of his humane and touching protest against the barbarous art: 'through which birds are

— by tyrant man
Inhuman caught, and in the narrow cage
From liberty confined, and boundless air,'

represents the nightingale's misery when thus bereaved. This portion of the lines shall stand entire; none, we are sure, would wish us further to mangle the passage:

'But chief, let not the nightingale lament
Her ruined care, too delicately framed
To brook the harsh confinement of the cage.
Oft, when returning with her loaded bill,
The astonished mother finds a vacant nest,
By the rude hands of unrelenting clowns
Robbed: to the ground the vain provision falls.
Her pinions ruffle, and low drooping, scarce
Can bear the mourner to the poplar shade;
Where all abandoned to despair, she sings
Her sorrows through the night.'

It will at once be seen that this description relates to an exceptional condition, and we have yet to seek what character Virgil and Thomson would give to the ordinary song of this paradoxical musician. For the Roman, we do not know that any passage exists in his works which can help us to a conclusion; but Thomson's testimony must undoubtedly be ranged on the contra side, as appears from the following lines in his *Agamemnon*:

'Ah, far unlike the nightingale! she sings
Unceasing through the balmy nights of May—
She sings from love and joy.'

In the passage from his *Spring*, which we have given, we cannot but fancy that the poet endeavoured—if we may so say—to effect a compromise between the opinion which, through the influence of classical poetry, generally prevailed as to the character of the bird's music, and the opposing convictions which his own senses had forced upon him. It was desirable to describe its strains according to the popular fancy, and therefore he borrowed from Virgil such a description of the bird's sorrow as under the assumed circumstances did no violence to his own judgment.

Thomson is not the only poet in whom we fancy we detect some such attempt at compromise. It appears to us that Villega, the Anacreon of Spain, in the following little poem, which we give in Mr Wiffen's translation, adopted, with a similar object, this idea of the nightingale robbed of her young. The truthful and somewhat minute description in the song, however, represents the bird's ordinary performance, and but ill suits the circumstances under which it is supposed to be uttered. The failure on the part of the poet may be ascribed to his secret conviction, that the nightingale's was a cheerful melody; and his labouring against that conviction to the necessity he felt himself under of following his classical masters.

'I have seen a nightingale
On a sprig of thyme bewail,
Seeing the dear nest that was
Hers alone, borne off, alas!
By a labourer: I heard,
For this outrage, the poor bird
Say a thousand mournful things
To the wind, which on its wings
From her to the guardian sky
Bore her melancholy cry—
Bore her tender tears. She spake
As if her fond heart would break.
One while in a sad, sweet note,
Gurgled from her straining throat,
She enforced her piteous tale,
Mournful prayer and plaintive wail;
One while with the shrill dispute,
Quite o'er-wearied, she was mute;
Then afresh, for her dear brood,
Her harmonious shrieks renewed;
Now she winged it round and round,
Now she skimmed along the ground;
Now from bough to bough in haste
The delighted robber chased;
And alighting in his path,
Seemed to say, 'twixt grief and wrath:
'Give me back, fierce rustic rude!
'Give me back my pretty brood!'
And I saw the rustic still
Answer: "That I never will!"

Independently of the untruthfulness of which a naturalist would complain in this description—for no birds under such circumstances of distress sing, but merely repeat each its own peculiar piercing cry, never at any other time heard, and which cannot be mistaken—there is a palpable effort of ingenuity discoverable in the representation, which seems to tell us that the writer was making up a story, rather than uttering his own belief. It may even be doubted whether Virgil himself, who seems first to have invented this fancy, and behind whose broad mantle later poets have sheltered themselves, may not have felt an inclination to depart from the Greek opinion of Philomel's ditty. Why otherwise did he not simply and at once—as his masters Homer and Theocritus had done before him—describe her notes as mournful, instead of casting about for some cause that might excuse him for giving them that character? But however this may be, we cannot conceal from ourselves, that some stubborn passages still remain in the poets, proclaiming that there are men, and those among the greatest and most tasteful, to whose fancy the voice of the nightingale has sounded full of woe.

Homer must be counted of this number—unless we think with Fox, in the preface to his *History of Lord Holland*, that it is only as to her wakefulness Penelope is compared to the night singing-bird; and so must Milton (for although Coleridge has satisfactorily dealt with the passage in *Il Penseroso*, the line of the Lady's song in *Comus* remains still); and Shakespeare himself, who could scarcely be influenced, as Milton might very possibly be, by the opinions of the Grecian poets.

It is a strange contest we are here considering. Which of us would for a moment doubt our ability to decide in a dispute as to the liveliness or sadness of any given melody?—yet here we see the greatest poets, the favoured children of nature, utterly at variance on a point concerning which we should have expected to find even the most ordinary minds able to decide.

The question becomes more involved from the fact, that some writers take both sides; for instance, Chiabrera in *Aleppo*: the nightingale

'Unwearied still reiterates her lays,
Jocund or sad, delightful to the ear;'

and Hartley Coleridge, in the following beautiful song

which we transcribe the more readily because it has not long been published, and may be new to many of our readers:

'Tis sweet to hear the merry lark,
That bids a blithe good-morrow;
But sweeter to hark in the twinkling dark
To the soothing song of sorrow.
Oh, nightingale! what doth she all?
And is she *sad* or *jolly*?
For ne'er on earth was sound of mirth
So like to melancholy.

The merry lark he soars on high,
No worldly thought o'ertakes him;
He sings aloud to the clear blue sky,
And the daylight that awakes him.
As sweet a lay, as loud, as gay,
The nightingale is trilling;
With feeling bliss, no less than his
Her little heart is thrilling.

Yet ever and anon a sigh
Peers through her lavish mirth;
For the lark's bold song is of the sky,
And hers is of the earth.
By night and day she tunes her lay,
To drive away all sorrow;
For bliss, alas! to-night may pass,
And wo may come to-morrow.'

We must now cite one or two of the many passages which represent the nightingale's as an *absolutely* cheerful song. We fear we cannot insist so much as Fox is disposed to do, on the evidence of Chaucer, who continually styles the nightingale's a merry note, because it is evident that in *his* day the word had a somewhat different meaning from that which it at present conveys. For example, the poet calls the organ 'merry.' Nor dare we lay stress upon the instance which Cary cites—in a note to his *Purgatory*—of a 'neglected poet,' Vallans, who in his *Tale of Two Swannes* ranks the 'merrie nightingale among the cheerful birds,' because we do not know whether, even at the time when Vallans wrote—the book was published, it seems, in 1590—'merrie' had come to bear its present signification.

We shall, however, find a witness among the writers of his period in Gawain Douglas, who died Bishop of Dunkeld in 1522. He, in a prologue to one of his *Æneids*, applies not only the word 'merry' to our bird, but one of less questionable signification—'mirthful.' If we come down to more modern times, we shall find Wordsworth, who seems above all others, except Burns, to have had a catholic ear for the whole multitude of natural sounds, not only refusing the character of melancholy to the nightingale's song, but placing it below the stock-dove's, because it is deficient in the pensiveness and seriousness which mark the note of the latter.

However, of all testimonies which can be brought on this side of the question, the strongest is that of Coleridge. No other has so accurately described the song itself; moreover, he alone has entered the lists avowedly as an antagonist, and confessing in so many words to the existence of an opinion opposite to his own.

'And hark! the nightingale begins its song,
"Most musical, most melancholy" bird.
A melancholy bird? oh, idle thought!
In nature there is nothing melancholy.
But some night-wandering man, whose heart was pierced
With the resemblance of a grievous wrong,
Or slow distemper, or neglected love,
First named these notes a melancholy strain:
And youths and maidens most poetical,

Who lose the deepening twilight of the spring
In ball-rooms and hot theatres, they still,
Full of meek sympathy, must heave their sighs
O'er Philomela's pity-pleading strains.
My friend, and thou, our sister! we have learnt
A different love: we may not thus profane
Nature's sweet voices, always full of love
And joyance! 'Tis the merry nightingale
That crowds and hurries and precipitates
With fast-thick warble his delicious notes,
As he were fearful that an April night
Would be too short for him to utter forth
His love-chant and disburden his full soul
Of all its music!'

Little now remains to be said. We have laid before the reader specimens of the two contending opinions, as well as of that which is set up as a golden mean between them; and he has but to put down our pages, and to walk forth—provided he does not live too far north, or in some smoke-poisoned town—to judge for himself as to the true character of the strains. Small risk, we think, would there be in pronouncing on which side his verdict would be given! Well do we remember the night when we first heard this sweet bird: how we listened and refused to believe—for we were young, and our idea had of course been that his song was a melancholy one—that those madly hilarious sounds could come from the mournful nightingale. Wordsworth attempts thus to account for the delusion under which the older poets laboured on this subject:

'Fancy, who leads the pastimes of the glad,
Full oft is pleased a wayward dart to throw,
Sending sad shadows after things not sad,
Peopling the harmless fields with sighs of wo.
Beneath her sway, a simple forest cry
Becomes an echo of man's misery.
What wonder? at her bidding ancient lays
Steeped in dire grief the voice of Philomel,
And that blithe messenger of summer days,
The swallow, twittered, subject to like spell.'

It is curious that the people who first fixed the stigma of melancholy upon our bird—the Greeks, or at least the Athenians, and it is of them we speak—were perhaps the very gayest people that ever danced upon the earth—absolute Frenchmen. The very sprightliness of their temper, however, by the universally prevailing law of contrast, may have induced in them a fondness for sad and doleful legends; and we confess, for our own part, that while we from our hearts admire the poetical beauty and elegance of their various fables, we do not a little disrelish the constant vein of melancholy which pervades them all. Not the least sad of their fictions is that which relates to the nightingale; a story that has found its way—and even more universally the opinion of the bird's music which it implied—amongst all the nations whom Greece has instructed and civilised.

But we have yet another reply to the question, 'Why do most people call the nightingale's a melancholy song?' It is heard by night, 'whilst our spirits are attentive,' and the solemn gloom of the hour influences the judgment of the ear; for another false impression, which like the monster Error of Spenser, has bred a thousand young ones as ill-favoured as herself, ascribes melancholy to night. There is no good reason why we should think thus of the night, still less that the impression should influence our judgment in other matters; and we owe no small thanks to those who have endeavoured to reclaim to their proper uses these misdirected associations, and to teach, that

'In nature there is nothing melancholy;'

but on the contrary,

'Healing her wandering and distempered child,
She pours around her softest influences,

—'The passage in Milton possesses an that of mere description. It is spoken melancholy Man, and has, therefore, a dra- or makes this remark, to rescue himself alluded with levity to a line of Milton's.'

Her sunny hues, fair forms, and breathing sweets,
 Her melodies of woods, and winds, and waters,
 Till he relent, and can no more endure
 To be a jarring and a dissonant thing
 Amid the general dance and harmony;
 But, bursting into tears, wins back his way,
 His angry spirit healed and harmonised
 By the benignant touch of love and beauty.'

THE TEA-COUNTRIES OF CHINA.

ABOUT four years ago, Mr Fortune, author of *Three Years' Wanderings in the Northern Provinces of China*, was deputed by the East India Company to proceed to China for the purpose of obtaining the finest varieties of the tea-plant, as well as native manufacturers and implements, for the government tea-plantations in the Himalaya. Being acquainted with the Chinese language, and adopting the Chinese costume, he penetrated into districts unvisited before by Europeans—excepting, perhaps, the Catholic missionaries—exciting no further curiosity as to his person or pedigree, than what was due to a stranger from one of the provinces beyond the great wall. His principal journeys were to Sung-lo, the great green-tea district, and to the Bohea Mountains, the great black-tea district; besides a flying visit to Kingtang, or Silver Island, in the Chusan archipelago. The narrative, which he has since published,* manifests a good faculty for observation; but travelling as privately as possible, he saw little but the exterior aspects of the country, the appearance of which he describes very graphically. As a botanist, he had a keen eye for everything which promised to enlarge our knowledge of the Chinese flora, and discovered many useful and ornamental trees and shrubs, some of which, such as the funeral cypress, will one day produce a striking and beautiful effect in our English landscape, and in our cemeteries. Of social and political information relative to the Celestial Empire, the book is quite barren; and we do not know that there is anything in it which will be so acceptable to the reader, as fresh and reliable information about his favourite beverage. To this, therefore, our attention will be confined.

The plant in cultivation about Canton, from which the Canton teas are made, is known to botanists as the *Thea bohea*; while the more northern variety, found in the green-tea country, has been called *Thea viridis*. The first appears to have been named upon the supposition, that all the black teas of the Bohea Mountains were obtained from this species; and the second was called *viridis*, because it furnished the green teas of commerce. These names seem to have misled the public; and hence many persons, until a few years ago, firmly believed that black tea could be made only from *Thea bohea*, and green tea only from *Thea viridis*. In his *Wanderings in China*, published in 1846, Mr Fortune had stated that both teas could be made from either plant, and that the difference in their appearance depended upon manipulation, and upon that only. But the objection was made, that although he had been in many of the tea-districts near the coast, he had not seen those greater ones inland which furnish the teas of commerce. Since that time, however, he has visited them, without seeing reason to alter his statements. The two kinds of tea, indeed, are rarely made in the same district; but this is a matter of convenience. Districts which formerly were famous for black tea, now produce nothing but green. At Canton, green and black teas are made from the *Thea bohea* at the pleasure of the manufacturer, and according to demand. When the plants arrive from the farms fresh and cool, they dry of a bright-green colour; but if they are delayed in their transit, or remain in a confined state

for too long a period, they become heated, from a species of spontaneous fermentation; and when loosened and spread open, emit vapours, and are sensibly warm to the hand. When such plants are dried, the whole of the green colour is found to have been destroyed, and a red-brown, and sometimes a blackish-brown result is obtained. 'I had also noticed,' says Mr Warrington, in a paper read by him before the Chemical Society, 'that a clear infusion of such leaves, evaporated carefully to dryness, was not all undissolved by water, but left a quantity of brown oxidised extractive matter, to which the denomination *apothem* has been applied by some chemists; a similar result is obtained by the evaporation of an infusion of black tea. The same action takes place by the exposure of the infusions of many vegetable substances to the oxidising influence of the atmosphere; they become darkened on the surface, and this gradually spreads through the solution, and on evaporation, the same oxidised extractive matter will remain insoluble in water. Again, I had found that the green teas, when wetted and redried, with exposure to the air, were nearly as dark in colour as the ordinary black teas. From these observations, therefore, I was induced to believe, that the peculiar characters and chemical differences which distinguish black tea from green, were to be attributed to a species of heating or fermentation, accompanied with oxidation by exposure to the air, and not to its being submitted to a higher temperature in the process of drying, as had been generally concluded. My opinion was partly confirmed by ascertaining from parties conversant with the Chinese manufacture, that the leaves for the black teas were always allowed to remain exposed to the air in mass for some time before they were roasted.'

This explanation by Mr Warrington from scientific data, is confirmed by Mr Fortune from personal observation, and fully accounts, not only for the difference in colour between the two teas, but also for the effect produced on some constitutions by green tea, such as nervous irritability, sleeplessness, &c.; and Mr Fortune truly remarks, that what Mr Warrington observed in the laboratory of Apothecaries' Hall, may be seen by every one who has a tree or bush in his garden. Mark the leaves which are blown from trees in early autumn; they are brown, or perhaps of a dullish green when they fall, but when they have been exposed for some time in their detached state to air and moisture, they become as black as our blackest teas. Without detailing the whole process in the manufacture of either kind of tea, it may be stated in reference to green tea, 1st, That the leaves are roasted almost immediately after they are gathered; and 2d, That they are dried off quickly after the rolling process. In reference to black tea, on the other hand, it may be observed, 1st, That after being gathered, the leaves are exposed for a considerable time; 2d, That they are tossed about until they become soft and flaccid, and are then left in heaps; 3d, That after being roasted for a few minutes and rolled, they are exposed for some hours to the air in a soft and moist state; and 4th, That they are at last dried slowly over charcoal fires. After all, then, genuine green tea is, as might reasonably be conjectured, an article less artificial than black. There is, at the same time, too much foundation for the suspicion, that the green teas so much patronised in Europe and America, are not so innocently manufactured. Mr Fortune witnessed the process of colouring them in the Hung-chow green-tea country, and describes the process. The substance used is a powder consisting of four parts of gypsum and three parts of Prussian blue, which was applied to the teas during the last process of roasting.

'During this part of the operation,' he says, 'the hands of the workmen were quite blue. I could not help thinking, that if any green-tea drinkers had been present during the operation, their taste would have

* *A Journey to the Tea-Countries of China.* By Robert Fortune. 1852.

been corrected, and, I may be allowed to add, improved. One day, an English gentleman in Shang-hae, being in conversation with some Chinese from the green-tea country, asked them what reasons they had for dyeing the tea, and whether it would not be better without undergoing this process. They acknowledged that tea was much better when prepared without having any such ingredients mixed with it, and that they never drank dyed teas themselves; but justly remarked, that as foreigners seemed to prefer having a mixture of Prussian blue and gypsum with their tea, to make it look uniform and pretty, and as these ingredients were cheap enough, the Chinese had no objections to supply them, especially as such teas always fetched a higher price! The quantity of colouring matter used is rather more than an ounce to 14½ lbs. of tea; so that in every 100 lbs. of coloured green tea consumed in England or America, the consumer actually drinks nearly half a pound of Prussian blue and gypsum! Samples of these ingredients, procured from the Chinamen in the factory, were sent last year to the Great Exhibition.

In the black-tea districts, as in the green, large quantities of young plants are yearly raised from seeds. These seeds are gathered in the month of October, and kept mixed up with sand and earth during the winter months. In this manner they are kept fresh until spring, when they are sown thickly in some corner of the farm, from which they are afterwards transplanted. When about a year old, they are from nine inches to a foot in height, and ready for transplanting. This is always done at the change of the monsoon in spring, when fine warm showers are of frequent occurrence. The most favourable situations are on the slopes of the hills, as affording good drainage, which is of the utmost importance; and which, on the plains, is attained by having the lands above the water-courses. Other things being equal, a moderately rich soil is preferred. They are planted in rows about four feet apart (in poor soils, much closer), and have a very hedge-like appearance when full grown. A plantation of tea, when seen at a distance, looks like a little shrubbery of evergreens. As the traveller threads his way amongst the rocky scenery of Woo-t-shan, he is continually coming upon these plantations, which are dotted upon the sides of all the hills. The leaves are of a rich dark-green, and afford a pleasing contrast to the strange, and often barren scenery which is everywhere around. The young plantations are generally allowed to grow unmolested for two or three years, till they are strong and healthy; and even then, great care is exercised not to exhaust the plants by plucking them too bare. But, with every care, they ultimately become stunted and unhealthy, and are never profitable when they are old; hence, in the best-managed tea-districts, the natives yearly remove old plantations, and supply their places with fresh ones. About ten or twelve years is the average duration allowed to the plants. The tea-farms are in general small, and their produce is brought to market in the following manner: A tea-merchant from Tsong-gan or Tsin-tsun, goes himself, or sends his agents, to all the small towns, villages, and temples in the district, to purchase teas from the priests and small farmers. When the teas so purchased are taken to his house, they are mixed together, of course keeping the different qualities as much apart as possible. By this means, a chop (or parcel) of 600 chests is made; and all the tea of this chop is of the same description or class. The large merchant in whose hands it is now, has to refine it, and pack it for the foreign market. When the chests are packed, the name of the chop is written upon each, or ought to be; but it is not unusual to leave them unmarked till they reach the port of exportation, when the name most in repute is, if possible, put upon them. When the chop is

purchased in the tea-district, a number of coolies are engaged to carry the chests on their shoulders, either to their ultimate destination, or to the nearest river. The time occupied in the entire transport by land and river, from the Bohea country to Canton, is about six weeks or two months. The expenses of transit, of course, vary with localities, and other circumstances; but, in general, those expenses are so very moderate, that the middlemen realise large profits, while the small farmers and manipulators are subjected to a grinding process, which keeps them in comparative poverty.

Of late years, some attempts have been made to cultivate the tea-shrub in America and Australia; but the result will not equal the expectation entertained by the projectors of the scheme. The tea-plant will grow wherever the climate and soil are suitable; but labour is so much cheaper in China than in either of those countries, that successful competition is impossible. The Chinese labourers do not receive more than twopence or threepence a day. The difference, therefore, in the cost of labour will afford ample protection to the Chinese against all rivals whose circumstances in this respect are not similar to their own.

India, however, is as favourably situated in all respects for tea-cultivation as China itself, and its introduction, therefore, into that country is a matter of equal interest and importance. In procuring the additional seeds, implements, and workmen, Mr Fortune succeeded beyond his expectations. Tea-seeds retain their vitality for a very short period, if they are out of the ground; and after trying various plans for transporting them to their destination, he adopted the method of sowing them in Ward's cases soon after they were gathered, which had the effect of preserving them in full life. The same plan will answer as effectually in preserving other kinds of seeds intended for transportation, and in which so much disappointment is generally experienced. In due time, all the cases arrived at their destination in perfect safety, and were handed over to Dr Jameson, the superintendent of the botanical gardens in the north-west provinces, and of the government tea-plantations. When opened, the tea-plants were found to be in a very healthy state. No fewer than 12,838 plants were counted, and many more were germinating. Notwithstanding their long voyage from the north of China, and the frequent transshipment and changes by the way, they seemed as green and vigorous as if they had been growing all the while on the Chinese hills.

In these days, when tea is no longer a luxury, but a necessary of life in England and her colonies, its production on Indian soil is worthy of persevering effort. To the natives of India themselves, it would be of the greatest value. The poor *paharie*, or hill-peasant, has scarcely the common necessities of life, and certainly none of its luxuries. The common sorts of grain which his lands produce will scarcely pay the carriage to the nearest market-town, far less yield such a profit as to enable him to procure any articles of commerce. A common blanket has to serve him for his covering by day and for his bed at night, while his dwelling-house is a mere mud-hut, capable of affording but little shelter from the inclemency of the weather. If part of these lands produced tea, he would then have a healthy beverage to drink, besides a commodity which would be of great value in the market. Being of small bulk, and extremely light in proportion to its value, the expense of carriage would be trifling, and he would have the means of making himself and his family more comfortable and more happy. In China, tea is one of the necessities of life, in the strictest sense of the word. A Chinese never drinks cold water, which he abhors, and considers unhealthy. Tea is his favourite beverage from morning to night—not what we call tea, mixed with milk and sugar—but the essence of the herb itself drawn out

in pure water. Those acquainted with the habits of the people, can scarcely conceive of their existence, were they deprived of the tea-plant; and there can be no doubt that its extensive use adds much to their health and comfort. The people of India are not unlike the Chinese in many of their habits. The poor of both countries eat sparingly of animal food; rice, and other grains and vegetables, form the staple articles on which they live. This being the case, it is not at all unlikely that the Indian will soon acquire a habit which is so universal in China. But in order to enable him to drink tea, it must be produced at a cheap rate, not at 4s. or 6s. a pound, but at 4d. or 6d.; and this can be done, but only on his own hills. The accomplishment of this would be an immense boon for the government to confer upon the people, and might ultimately work a constitutional change in their character and temperament—ridding them of their proverbial indolence, and endowing them with that activity of body and mind which renders the Chinese so un-Asiatic in their habits and employments.

That our readers may, if they choose, have 'tea as in China,' we quote a receipt from a Chinese author, which may be of service to them. 'Whenever the tea is to be infused for use,' says Tung-po, 'take water from a running stream, and boil it over a lively fire. It is an old custom to use running water boiled over a lively fire; that from springs in the hills is said to be the best, and river-water the next, while well-water is the worst. A lively fire is a clear and bright charcoal fire. When making an infusion, do not boil the water too hastily, as first it begins to sparkle like crabs' eyes, then somewhat like fish's eyes, and lastly, it boils up like pearls innumerable, springing and waving about. This is the way to boil the water.' The same author gives the names of six different kinds of tea, all of which are in high repute. As their names are rather flowery, they may be quoted for the reader's amusement. They are these: the 'first spring tea,' the 'white dew,' the 'coral dew,' the 'dewy shoots,' the 'money shoots,' and the 'rivulet garden tea.' 'Tea,' says he, 'is of a cooling nature, and, if drunk too freely, will produce exhaustion and lassitude. Country people, before drinking it, add ginger and salt, to counteract this cooling property. It is an exceedingly useful plant; cultivate it, and the benefit will be widely spread; drink it, and the animal spirits will be lively and clear. The chief rulers, dukes, and nobility, esteem it; the lower people, the poor and beggarly, will not be destitute of it; all use it daily, and like it.' Another author upon tea says, that 'drinking it tends to clear away all impurities, drives off drowsiness, removes or prevents headache, and it is universally in high esteem.'

THE GREAT OYER OF POISONING.

In a previous article, an account was given of the proceedings against the Earl and Countess of Somerset for the murder of Sir Thomas Overbury. Though they were spared, several other persons were executed for this offence; and the circumstances under which those who were represented as the chief criminals escaped, while the others, whose guilt was represented as merely secondary, were executed, is among the most mysterious parts of the history. There was so much said about poisoning throughout the whole inquiry, that Sir Edward Coke gave the trials the name of 'The Great Oyer of Poisoning.' Oyer has long been a technical term in English law; and it is almost unnecessary to explain, that it is old French for *to hear*—oyer and *terminer* meaning, to hear and determine. The same inscrutable reasons which make the evidence so imperfect against the chief offenders, affect the whole of it. But while the exact causes of the death of Sir Thomas Overbury may be left in doubt, as well as the motives which led to it, enough is revealed in the trials

of the minor offenders to throw a remarkable light on the strange habits of the time, and especially on the profligacy and credulity of the court of King James.

The first person put to trial was Richard Weston, who had been appointed for the purpose of taking charge of Sir Thomas Overbury. If he had been murdered by poison, there could be no doubt that Weston was one of the perpetrators. He had been brought up as an apothecary; and it was said that he was selected on account of his being thus enabled to dabble in poisons. The charge against him is very indistinct. He was charged that he, 'in the Tower of London, in the parish of Allhallows Barking, did obtain and get into his hand certain poison of green and yellow colour, called rosagar—knowing the same to be deadly poison—and the same did maliciously and feloniously mingle and compound in a kind of broth poured out into a certain dish.' Weston long refused to plead to the indictment. Of old, a person could not be put on trial unless he pleaded not guilty, and demanded a trial. The law, however, provided for those who were obstinate a more dreadful death than would be inflicted on the scaffold. To frighten him into compliance, the court gave him a description of it, telling him that he was 'to be extended, and then to have weights laid upon him no more than he was able to bear, which were by little and little to be increased; secondly, that he was to be exposed in an open place near to the prison, in the open air, being naked; and lastly, that he was to be preserved with the coarsest bread that could be got, and water out of the next sink or puddle.' He was told that 'oftentimes men lived in that extremity eight or nine days.' People have sometimes endured the *pains forte et dure*, as it was called, because, unless they pleaded and were convicted, their estates were not forfeited; and they endured the death of protracted torture for the sake of their families. Weston's object was supposed to be to prevent a trial, the evidence in which would expose his great patrons the Earl and Countess of Somerset. The motive was not, however, strong enough to make him stand to his purpose. He pleaded to the indictment, was found guilty, and executed at Tyburn.

The next person brought up was of a more interesting character—Anne Turner, the widow of a physician. It is stated in the Report, that when she appeared at the bar, the chief-justice Coke said to her: 'that women must be covered in the church, but not when they are arraigned, and so caused her to put off her hat; which done, she covered her hair with her handkerchief, being before dressed in her hair with her handkerchief over it.' Although Mother Turner's pursuits were of the questionable kind generally attributed to old hags—she dealt in philters, soothsaying, and poisoning—she must have been a young and beautiful woman. In some of the letters which were produced at the trials, she was called 'Sweet Turner.' In a poem, called *Overbury's Vision*, published in 1616, and reprinted in the seventh volume of the *Harleian Miscellany*, she is thus enthusiastically described—

'It seemed that she had been some gentle dame;
For on each part of her fair body's frame
Nature such delicacy did bestow,
That fairer object oft it doth not shew.
Her crystal eye, beneath an ivory brow,
Did shew what she at first had been; but now
The roses on her lovely cheeks were dead;
The earth's pale colour had all overspread
Her sometime lovely look; and cruel Death,
Coming untimely with his wintry breath,
Blasted the fruit which, cherry-like in show,
Upon her dainty lips did whilome grow.
Oh, how the cruel cord did misbecome
Her comely neck! And yet by law's just doom
Had been her death.'

It might be said to be Mrs Turner's profession, to

minister to all the bad passions of intriguers. The wicked Countess of Essex employed her to secure to her, by magic arts and otherwise, the affection of Somerset, and at the same time to create alienation and distaste on the part of her husband. Among the documents produced at her trial was one said to be a list of 'what ladies loved what lords;' and it is alleged that Coke prohibited its being read, because, whenever he cast his eye on it, he saw there the name of his own wife. Some mysterious articles were produced at the trial, which were believed to be instruments of enchantment and diabolical agency. 'There were also enchantments shewed in court, written in parchment, wherein were contained all the names of the blessed Trinity mentioned in the Scriptures; and in another parchment + B + C + D + E; and in a third, likewise in parchment, were written all the names of the holy Trinity, as also a figure, on which was written this word, *corpus*; and on the parchment was fastened a little piece of the skin of a man. In some of these parchments were the devil's particular names, who were conjured to torment the Lord Somerset, and Sir Arthur Manwaring, if their loves should not continue, the one to the Countess, the other to Mrs Turner.' Along with these were some pictures, as they were termed, or, more properly speaking, models of the human figure. 'At the shewing,' says the report, 'of these, and enchanted papers, and other pictures in court, there was heard a crack from the scaffolds, which caused great fear, tumult, and confusion among the spectators, and throughout the hall, every one fearing hurt, as if the devil had been present, and grown angry to have his workmanship shewed by such as were not his own scholars.'*

The small figures, which appeared to have created the chief consternation, were, we are inclined to believe, very innocent things. There was, it is true, a belief that an individual could be injured or slain by operations on his likeness. There was, however, another purpose connected with Mrs Turner's pursuits to which small jointed images, like artists' lay figures, were used. This was to exhibit the effect of any new fashion, or peculiar style of dress. In this manner small figures, about the size of dolls, were long used in Paris. We have seen people expressing their surprise at pictures of full-grown Frenchwomen examining dolls, but in reality they were not more triflingly occupied than those who now contemplate the latest fashions in their favourite feminine periodical. Mrs Turner was very likely to have occasion for such figures, for she was, with her other pursuits, a sort of dressmaker, or *modiste*; in fact, she seems to have been a ready minister to every kind of human vanity and folly, as well as to a good deal of human wickedness. In the department of dress, she had a name in her own sex and age as illustrious as that of Brummel among dandies in the beginning of this century. As he was the inventor of the starched cravat, she was his precursor in the invention of the starched ruff, or, as it is generally said, of the yellow starch.

The best account we have of the starched ruff is by a man who wrote to abuse it. An individual named Stubbes published an *Anatomy of Abuses*. Having become extremely rare, a small impression of it was lately reprinted, as a curious picture of the times. Stubbes dealt trenchantly with everything that savoured of pride and ostentation in dress; and he was peculiarly severe on Mrs Turner's invention, which made the ruff stand against bad weather. He describes the ruffs as having been made 'of cambric Holland lawn; or else of some other the finest cloth that can be got for money, whereof some be a quarter of a yard deep; yea, some more—very few less.' He describes with much glee the elementary calamities to which, before

the invention of the starch, they were liable. 'If Æolus with his blasts, or Neptune with his storms, chance to hit upon the crazy barque of their bruised ruffs, then they goeth flip-flap in the wind, like rags that flew abroad, lying upon their shoulders like the dish-clout of a slut.' Having thus, with great exultation, described these reproofs to human pride, he mentions how 'the devil, as he, in the fulness of his malice, first invented these great ruffs, so hath he now found out also two great pillars to bear up and maintain this his kingdom of great ruffs—for the devil is king and prince over all the kingdom of pride.' One pillar appears to have been a wire framework—something, perhaps, of the nature of the hoop. The other was 'a certain kind of liquid matter, which they call starch, wherein the devil hath willed them to wash and dye their ruffs well; and this starch they make of divers colours and hues—white, red, blue, purple, and the like, which, being dry, will then stand stiff and inflexible about their necks.'

Mrs Turner, at her execution, was arrayed in a ruff stiffened with the material for the invention of which she was so famous. She had for her scientific adviser a certain Dr Forman—a man who was believed to be deep in all kinds of dangerous chemical lore, and at the same time to possess a connection with the Evil One, which gave him powers greater than those capable of being obtained through mere scientific agency. Had he been alive, he would have undoubtedly been tried with the other poisoners. His widow gave some account of his habits, and of his wonderful apparatus, such as 'a ring which would open like a watch;' but the glimpse obtained of him is brief and mysteriously tantalising. We remember that, about twenty-five years ago, this man was made the hero of a novel called *Forman*, which contains much effective writing, but did not somehow fit the popular taste.

Notwithstanding the scientific ingenuity both of the males and females concerned in this affair, the poisoning seems to have been conducted in a very bungling manner when compared with the slow and secret poisonings of the French and Italians. It is believed that a female of Naples, called Tophana, who used a tasteless liquid, named after her *Aqua Tophana*, killed with it 600 people before she was discovered to be a murderess. The complete secrecy in which these foreigners shrouded their operations—people seeming to drop off around them as if by the silent operation of natural causes—was what made their machinations so frightful. Poisoning, however, is a cowardly as well as a cruel crime, which has never taken strong root in English habits; and, as we have observed, the poisoners on this occasion, notwithstanding the skill and knowledge enlisted by them in the service, were arrant bunglers. Thus, the confession of James Franklin, an accomplice, would seem to shew that Sir Thomas Overbury was subjected to poisons enough to have deprived three cats of their twenty-seven lives.

'Mrs Turner came to me from the countess, and wished me, from her, to get the strongest poison I could for Sir T. Overbury. Accordingly, I bought seven—viz., aquafortis, white arsenic, mercury, powder of diamonds, *lapis costivus*, great spiders, and cantharides. All these were given to Sir T. Overbury at several times. And further confesseth, that the lieutenant knew of these poisons; for that appeared, said he, by many letters which he writ to the Countess of Essex, which I saw, and thereby knew that he knew of this matter. One of these letters I read for the countess, because she could not read it herself; in which the lieutenant used this speech: "Madam, the scab is like the fox—the more he is cursed, the better he fareth." And many other speeches. Sir T. never eat white salt, but there was white arsenic put into it. Once he desired pig, and Mrs Turner put into it *lapis costivus*. The white powder that was sent to Sir T. in a

* *State Trials*, ii. 932.

letter, he knew to be white arsenic. At another time, he had two partridges sent him by the court, and water and onions being the sauce, Mrs Turner put in cantharides instead of pepper; so that there was scarce anything that he did eat but there was some poison mixed.*

It is impossible to believe that the human frame could stand out for weeks against so hot a siege. It would appear as if Franklin must really have confessed too much. It has already been said, that the confused state of the whole evidence renders it difficult to find how far a case was made out against the Earl and Countess of Somerset. Such a confession as Franklin's only makes matters still more confused. That Sir Thomas Overbury really was poisoned, one can scarcely doubt, if even a portion of what Franklin and the others say is true; but the reckless manner in which the crime was gone about, and the confusion of the whole evidence, is extremely perplexing. Not the least remarkable feature in this tragedy is the number of people concerned in it. We find, brought to trial, the Earl and Countess of Somerset and Sir Thomas Monson, who, though said to be the guiltiest of all, were spared: Weston, Franklin, and Mrs Turner, were executed: Forman, and another man of science who was said to have given aid, had gone to their account before the trials came on. Then, in Franklin's confession, it was stated that 'the toothless maid, trusty Margaret, was acquainted with the poisoning; so was Mrs Turner's man, Stephen; so also was Mrs Horne, the countess's own handmaid;' and several other subordinate persons are alluded to in a similar manner.

The quietness and secrecy of the French and Italian poisonings have been already alluded to. The poisoners, in general, instead of acting in a bustling crowd, generally prepared themselves for their dreadful task by secretly acquiring the competent knowledge, so that they might not find it necessary to take the aid of confederates. They generally did their work alone, or at most two would act together. It certainly argues a sadly demoralised state of society in the reign of King James, that so many persons should be found who would coolly connect themselves with the work of death; but still there was not so much real danger as in the quiet, systematic poisonings of such criminals as Topham and the Countess of Brinvilliers. The great Oyer of poisoning was, however, calculated to make a very deep impression on the public mind. It filled London with fear and suspicion. When rumours about poisonings become prevalent, no one knows exactly how far the crime has proceeded, and this and that event is remembered and connected with it. All the sudden deaths within recollection are recalled, and thus accounted for. People supposed to be adepts in chemistry were in great danger from the populace, and one man, named Lamb, was literally torn to pieces by a mob at Charing-Cross. The people began to dwell upon the death of Prince Henry, the king's eldest son, who had fallen suddenly. It was remembered that he was a youth of a frank, manly disposition—the friend and companion of Raleigh and of other heroic spirits. He liked popularity, and went into many of the popular prejudices of the times—forming altogether in his character a great contrast to his grave, dry, fastidious, and suspicious brother Charles, who was to succeed to his vacant place. He had died very suddenly—of fever, it was said; but popular rumour now attributed his death to poison. Nay, it was said that his own father, jealous of his popularity, was the perpetrator; and it was whispered that this was the secret which King James was so afraid his favourite Somerset might tell if prosecuted to death. In a work called *Truth brought to Light*, a copy was given of an alleged medical report on a dissection of the body, calculated to confirm these

suspensions: it may be found in the *State Trials*, ii. 1002. Arthur Wilson, who published his life and reign of King James during the Commonwealth, said: 'Strange rumours are raised upon this sudden expiration of our prince, the disease being so violent that the combat of nature in the strength of youth (being almost nineteen years of age) lasted not above five days. Some say he was poisoned with a bunch of grapes; others attribute it to the venomous scent of a pair of gloves presented to him (the distemper lying for the most part in the head.) They that knew neither of these are stricken with fear and amazement, as if they had tasted or felt the effects of those violences. Private whisperings and suspicions of some new designs afoot broaching prophetic terrors that a black Christmas would produce a bloody Lent, &c.' Kennet, in his notes on Wilson's work, says that he possesses a rare copy of a sermon preached while the public mind was thus excited, 'wherein the preacher, who had been his domestic chaplain, made such broad hints about the manner of his (Prince Henry's) death, that melted the auditory into a flood of tears, and occasioned his being dismissed the court.'

But suspicion did not stop here. When King James himself died in much pain, his body shewing the unsightly symptoms consequent on his gross habits, poison was again suspected; and as it had been said on the former occasion, that the father had connived at the death of his son, it was now whispered that the remaining son, anxious to commence his ill-starred reign, was accessory to hurrying his father from the world. The moral character of Charles I. is sufficient to acquit him of such a charge. But historians even of late date have not entirely acquitted his favourite, Buckingham, who, it was said, finding that the king was tired of him, resolved to make him give place to the prince, in whose good graces he felt secure. The authors of the scandalous histories published during the Commonwealth, said that the duke's mother administered the poison externally in the form of a plaster.

NEURALGIA.*

OBSTRUCTIVES and sceptics are in one sense benefactors: although they do not generally originate improved modes of thought and action, they at least prevent the adoption of crude theories and ill-digested measures. To meet the criticism of these opponents, inventive genius must more carefully bring its ideas and plans to the test of practical experiment and thorough investigation; and as truth must ultimately prevail, it cannot be considered unjust or injurious to insist upon its presenting its credentials. This is, we submit, one of the benefits resulting from schools, colleges, and guilds: it is difficult to impress them with novel truths; but in a great degree they act as breakwaters to the waves of error. In no department of social life is this doctrine better illustrated than in the medical profession, which is among the keenest and most sceptical of bodies in scrutinising novelty; but it has rarely allowed any real improvement to remain permanently untested and unadopted. We believe this to be the fair view to take of a class of scientific men who have certainly had a large share of sarcasm to endure.

General readers, for whom we profess to cater, take no great interest in medical subjects and discussions; but as historians of what is doing in the world of art, science, and literature, we think it our duty to record, in a brief way, any information we can collect that may

* *Neuralgia: its various Forms, Pathology, and Treatment.* Being the Jacksonian Prize Essay of the Royal College of Surgeons for 1850; with some Additions. By C. Toogood Downing, M.D., M.R.C.S. Churchill, London.

* *State Trials*, 941.

be beneficial to the suffering portion of humanity; and in this 'miserable world' it is most probable that one-fourth part of our readers are invalids. Why should they not have their little troubles, whims, and maladies studied and cared for? The disease which gives a title to this short notice is perhaps one of the most mysterious and vexatious to which our nature is liable; both its cause and cure are equally occult, and its *modus operandi* is scarcely intelligible. A contemporary thus playfully alludes to the subject in terms more funny than precise:—'What is neuralgia? A nervous spasm, the cause of which has, however, not been satisfactorily and conclusively demonstrated; but we may, perhaps, obtain a clearer view of its nature, if we look upon it as connected with "morbid nutrition." Every one knows that the system is, or ought to be, constantly subject to a law of waste and repair; and if the operation of this law is impeded by "cold," "mental excitement," or any other baneful condition, diseases more or less unpleasant must ensue. The *vis nature* uses certain particles of matter in forming nerves; others in forming membrane, bones, juices, &c.; while used-up particles are expelled altogether from the system. We can readily conceive that each order of atoms is used by a distinct function, and has a different mission; and any morbid perversion or mingling of their separate destinies must end in disorder and suffering—nature's violent endeavour to restore the regularity of her operations. A cough is simply an effort of the lungs or bronchiæ to remove some offending intruder that ought to be doing duty elsewhere; and may we not call neuralgia a *cough of a nerve* to get rid of a disagreeable oppression—nature's legitimate *coup d'état* to put down and transport those "*red socialist*" particles that would interfere with the regularity of its constitution? Let us fancy, for a moment, a delicate little army of atoms marching obediently along, to form new nerve in place of the substance that is wasting away: another little army of carbonaceous particles have just received orders to pack up their luggage and be off, to make way for the advancing nerve-battalion; but in their exodus they are met by a fierce destroyer, in the shape of an east wind—a Caffre that suddenly throws the ranks of General Carbon into disorder, and drives them back upon the brilliant and pugnacious array of General Nerve: a battle-royal is the result. General Nerve immediately places lance in rest, and advances to the charge with the unsparing war-cry of: "Mr Ferguson, you don't lodge here!" and if Caffre East-wind is not despised and trifled with, he is generally beaten for a time; but great are the sufferings of humanity—the scene of this encounter—while the fight is raging.'

Now comes the question: How to get rid of this cruel invader? Dr Downing has undertaken to give an answer, which we believe to be satisfactory. In addition to the proper medical and hygienic treatment, which is carefully and ably stated in the work before us, Dr Downing has invented an apparatus which appears to be very efficacious; and we will therefore allow him to describe it in his own words:—"From considering tic douloureux as often a local disease, depending on a state of excessive irritability, sensibility, or spasm of a particular nerve, and from reflecting upon its causes, and observing the effect of topical sedatives, I was led to the conclusion, that the most direct way of quieting this state was by the application of warmth and sedative vapour to the part, so as to soothe the nerves, and calm them into regular action. For this purpose, I devised an apparatus which answers the purpose sufficiently well. It is a kind of fumigating instrument, in which dried herbs are burned, and the heated vapour directed to any part of the body. It is extremely simple in construction, and consists essentially of three parts with their media of connection—a cylinder for igniting the vegetable

matter, bellows for maintaining a current of air through the burning material, and tubes and cones for directing and concentrating the stream of vapour. The chief medicinal effects I have noticed in the use of this instrument are those of a sedative character; but its remedial influence is not alone confined to the use of certain herbs. A considerable power is attributable to the warm current or intense heat generated. When the vegetable matter is ignited, and a current of air is made to pass through the burning mass, a small or great degree of heat can be produced at pleasure. Thus, when the hand is gently pressed upon the bellows, a mild, warm stream of vapour is poured forth which may act as a *douche* to irritable parts; but by strongly and rapidly compressing the same receptacle, the fire within the cylinder is urged like that of a smith's forge, and the blast becomes intensely hot and burning.'

Those who wish to know more of this mode of treatment, had better refer to the work itself. We must content ourselves with having simply drawn our readers' attention to it.

ANCIENT GLACIERS IN THE LAKE COUNTRY.

MR ROBERT CHAMBERS, in a recent tour of the lakes of Westmoreland (April 1852), has discovered that the valleys of that interesting district were at one time occupied by glaciers. Glacialised surfaces were previously observed in a few places not far from Kendal, but without any conclusion as to the entire district. By Mr Chambers conspicuous and unequivocal memorials of ice-action have been found in most of the great central valleys, such as those of Derwentwater, Ulleswater, Thirlwater, and Windermere. The principal phenomena are rounded hummocks of rock on the skirts of the hills, and in the middle of the valleys; and as these hummocks, whatever may be the direction of the valleys, invariably present a smoothed side up, and an abrupt side downwards (*stoss-seite* and *lee-seite* of the Scandinavian geologists), it becomes certain that the glaciers proceeding from the mountains at the upper extremities were local to the several valleys. The smoothed hummocks are very noticeable in Derwentwater or Borrowdale, the celebrated Bowderstone resting on one; a particularly fine low surface appears at Grange, near the head of the lake. At Patterdale, in Ulleswater Valley, the rocks are so much marked in this manner, that the whole place bears a striking resemblance to the sterile parts of Sweden; and some small rocky islets, near the head of the lake, are unmistakable *roches moutonnées*. The two valleys descending in opposite directions from Dummil Raise, have had glaciers proceeding from some central point: in that of Thirlwater, the rounded hummocks are conspicuous at Armboth; in the other, near Grasmere, and near the Windermere Railway Station. In all these cases, the characteristic striation, or scratching produced on rock-surfaces by glaciers, is more or less distinct, according as the surface may have been protected in intermediate ages. Where any drift or alluvial formation has covered it, the polish and striation are as perfect as if they had been formed in recent times, and the lines are almost invariably in the general direction of the valley.

Printed and Published by W. and R. CHAMBERS, High Street, Edinburgh. Also sold by W. & O. Orr, Amen Corner, London; N. CHAMBERS, 65 West Nile Street, Glasgow; and J. McEwen, 60 Upper Sackville Street, Dublin.—Advertisements for Medicine and Surgery are requested to be sent to MAXWELL & CO., 24 Mark Lane, Lombard Street, London, to whom all applications respecting their insertion must be made.

PROSAIC SPIRIT OF THE AGE.

THERE are some phrases that convey only a vague and indefinite meaning, that make an impression upon the mind so faint as to be scarcely resolvable into shape or character. Being associated, however, with the feeling of beauty or enjoyment, they are ever on our lips, and pass current in conversation at a conventional value. Of these phrases is the 'poetry of life'—words that never fail to excite an agreeable though dreamy emotion, which it is impossible to refer to any positive ideas. They are generally used, however, to indicate something gone by. The poetry of life, we say, with sentimental regret, has passed away with the old forms of society; the world is disenchanted of its talismans; we have awakened from the dreams that once lent a charm to existence, and we now see nothing around us but the cold hard crust of external nature.

This must be true if we think it is so; for we cannot be mistaken, when we feel that the element of the poetical is wanting in our constitutions. But we err both in our mode of accounting for the fact, and in believing the loss we deplore to be irretrievable. The fault committed by reasoners on this subject is, to confound one thing with another—to account for the age being unpoetical—as it unquestionably is—by a supposed decay in the materials of poetry. We may as well be told that the phenomena of the rising and setting sun—of clouds and moonlight—of storm and calm—of the changing seasons—of the infinitely varying face of nature, are now trite and worn-out. They are as fresh and new as ever, and will be so at the last day of the world, presenting, at every recurring view, something to surprise as well as delight. To each successive generation of men, the phenomena both of the outer and inner world are absolutely new; and the child of the present day is as much a stranger upon the earth as the first-born of Eve. But the impression received by each individual from the things that surround him is widely different—as different as the faces in a crowd, which all present the common type of humanity without a single feature being alike. This fact we unconsciously assert in our everyday ~~utterances~~ ^{speech}; for when any similarity is detected in a ~~description~~ ^{character}, whether of things internal or external, we at once stigmatise the later version as a plagiarism, and as such set it down as a confession of weakness.

Although the manifestations of nature, being ~~finite~~ ^{finite}, cannot be worn out, the capacity to enjoy them, ~~being human~~ ^{being human}, may decay. It may, in fact, in some ~~instances~~ ^{instances}, be entirely wanting, and in some generations ~~be almost~~ ^{be almost} partially so. Seamen, for instance, who live, move, and have their being in a world of poetry and

romance, are the least poetical of men; even in their songs they affect the prosaic and matter of fact, and discard everything appertaining to the fanciful.* Here is a direct instance of the materials of poetry being present, and its spirit wanting. So common, however, is it to confound the poetical with the faculty of enjoying it, that we find a hygienic power ascribed as an absolute property to the beauty of that very element, from which they who view it, both in its sweetest and grandest aspects, derive no elevation of feeling whatever. Hufeland, who reckons among the great panaceas of life the joy arising from the contemplation of the beauties of nature, in estimating the advantage of sea-bathing as the chief natural tonic, attributes it in great part to the action of the prospect of the sea upon the nervous system. 'I am fully convinced,' says he, 'that the physical effects of sea-bathing must be greatly increased by the impression on the mind, and that a hypochondriac or nervous person may be half-cured by residing on the sea-coast, and enjoying a view of the grand scenes of nature which will there present themselves—such as, the rising and setting of the sun over the blue expanse of the waters, and the awful majesty of the waves during a storm.' Now, if all patients were alike impressionable, this would be sound doctrine; but, as it is, few see the sun rise at all, many retire before the dews of evening begin to condense, and almost all shut themselves carefully up during a storm.

The poetry of life, we need hardly say, is not associated exclusively with the things of external nature:

All thoughts, all passions, all delights,
Whatever stirs this mortal frame,

are likewise a portion of the materials which it informs as with a soul. For poetry does not create, but modify. It is neither passion nor power; neither beauty nor love; but to one of these it gives exaltation, to another majesty; to one enchantment, to another divinity. It is not the light of 'the sun when it shines, nor of the moon walking in brightness,' but the glory of the one, and the grace and loveliness of the other. It is not instruction, but that which lends to instruction a loftier character, ascending from the finite to the infinite. It is not morality, but that which deepens the moral impression, and sends the thrill of spiritual beauty throughout the whole being. But its appeals, says an eloquent writer, are mainly 'to those affections that are apt to become indolent and dormant amidst the commerce of the world;' and it aims at the 'revival of those purer and more

* See Journal, No. 425. Article, 'Dibdin's Sailor-Songs.'

enthusiastic feelings which are associated with the earlier and least selfish period of our existence. Immersed in business, which, if it sharpen the edge of intellect, leaves the heart barren; toiling after material wealth or power, and struggling with fortune for existence; seeing selfishness reflected all around us from the hard and glittering surface of society as from a cold and polished mirror; it would go hard with man in adversity, perhaps still more in prosperity, if some resource were not provided for him, which, under the form of an amusement and recreation, administered a secret but powerful balsam in the one case, and an antidote in the other.' Poetry elevates some of our emotions, disinters others from the rubbish of the world, heightens what is mean, transforms what is unsightly,

Clothing the palpable and the familiar
With golden exhalations of the dawn.

It is a spiritual wine which revives the weary denizen of the vale of tears, and softens, warms, and stimulates, without the reaction of material cordials. 'It gives him wings,' says another writer, 'and lifts him out of the dirt; and leads him into green valleys; and carries him up to high places, and shews him at his feet the earth and all its glories.'

The poetry of life, therefore, although one of those expressions that baffle definition, points to something of vast importance to the happiness of men and the progress of the race. It is no idle dream, no mere amusement of the fancy. Whenever we feel a generous thrill on hearing of a great action—that is poetry. Whenever we are conscious of a larger and loftier sympathy than is implied in the exercise of some common duty of humanity—that is poetry. Whenever we look upon the hard realities of life through a medium that softens and relieves them—that medium is poetry. Without poetry, there is no loftiness in friendship, no devotedness in love. The feelings even of the young mother watching her sleeping child till her eyes are dim with happiness, are one half poetry. Hark! there is music on the evening air, always a delightful incident in the most delightful scene; and here there are ruins, and woods, and waters, all the adjuncts of a picture. This is beauty; but if we breathe over that beauty the spirit of poetry, see what a new creation it becomes, and what a permanent emotion it excites!

The splendour falls on castle walls,
And snowy summits, old in story;
The long light shakes across the lakes,
And the wild cataract leaps in glory.
Blow, bugle blow, set the wild echoes flying;
Blow bugle, answer echoes, dying, dying, dying.

O hark! O hear! how thin and clear,
And thinner, clearer, further going;
O sweet and far, from cliff and scar,
The horns of Elfland faintly blowing!
Blow, let us hear the purple glens replying;
Blow bugle, answer echoes, dying, dying, dying.

O love, they die in yon rich sky!
They faint on field, and hill, and river;
Our echoes roll from soul to soul,
And grow for ever and for ever.
Blow, bugle blow, set the wild echoes flying;
And answer, echoes answer, dying, dying, dying.*

This is a sample of the spiritual wine we have talked of—something to elevate and intoxicate. But the picture it presents does not pass away in the reaction of the morning. It haunts us in all after-life, rising up before us in the pauses of the world, to heal and refresh our wearied spirits.

* Tennyson.

As in this poem the pleasure is caused by its appeals to the imagination heightening the feeling the scene naturally excites; by the spiritual and material world being linked together as regards the music; and by the connection established between the echoes and the sky, field, hill, and river, where they die—just so it is with the poetry of moral feeling. The spectacle we have instanced of the young mother watching her sleeping infant, is in itself beautiful; but it becomes poetical when we imagine the feeling of beauty united in her mind with the instinct of love, and detect in her glance, moist with emotion, the blending of hopes, memories, pride, and tearful joy. Poetry, therefore, is not moral feeling, but something that heightens and adorns it. It is not even a direct moral agent, for it deepens the lesson only through the medium of the feelings and imagination. Thus moral poetry, when reduced to writing, is merely morality conveyed in the form of poetry; and in like manner, religious poetry, is religion so conveyed. The thing conveyed, however, must harmonise with the medium, for poetry will not consent to give an enduring form to what is false or pernicious. It has often been remarked, with a kind of superstitious wonder, that poems of an immoral character never live long; but the reason is, that it is the characteristic of immorality to tie down man in the chains of the senses, and this shews that it has nothing in common with the spiritual nature of poetry. For the same reason, a poem based upon atheism, although it might attract attention for a time, would meet with no permanent response in the human breast; religion being Truth, and poetry her peculiar ministrant.

Although written poetry, however, does not necessarily come into this subject, it may be observed, that the comparative incapacity of the present generation to enjoy the poetical is clearly exhibited in its literature. Never was there so much verse, and so little poetry. Never was the faculty of rhyming so impartially spread over the whole mass of society. The difficulty used to be, to find one possessed of the gift: now it is nearly as difficult to find one who is not. Formerly, to write verses was a distinction: now it is a distinction not to write them—and one of some consequence. But with all this multitude of poets, there is not one who can take his place with the comparatively great names of the past, or vanishing generation. Now and then we have a brilliant thought—even a certain number of verses deserving the name of a poem; but there is no sustained poetical power, nothing to mark an epoch, or glorify a name. When we commend, it is some passage distinct from the poem, something small, and finished, and complete in itself. The taste of the day runs more upon conceits and extravagances, such as Cowley would have admired, and which he might have envied. The suddenness of the impression, so to speak, made by great poets, their direct communication with the heart, belongs to another time. It is our ambition to come to the same end by feats of ingenuity; and instead of touching the feelings, and setting the imagination of the reader instantaneously aglow, to exercise his skill in unravelling and interpretation. We expect the pleasure of success to reward him for the fatigue.

The same feeling is at work, as we have already pointed out, in decorative art; in which 'a redundancy of useless or ridiculous ornament is called richness, and the inability to appreciate simple and beautiful, or grand and noble forms, receives the name of genius.' The connection is curious, likewise, between this ingenuity of poetry and that of the machinery which gives a distinguishing character to our epoch. It looks as if the complication of images, working towards a certain end, were only another development of the genius that invents those wonderful instruments which the eye cannot follow till they are familiarly explained—and sometimes not even then. If this idea were kept

in view, there would be at least some wit, although no truth, in the common theory which attempts to account for the decline of poetry. Neither advancement in science, however, nor ingenuity in mechanics, is in itself, as the theory alleges, hostile to the poetical; on the contrary, the materials of poetry multiply with the progress of both. The prosaic character of the age does not flow from these circumstances, but exists in spite of them. It has been said, indeed, that the light of knowledge is unfavourable to poetry, by making the hues and lineaments of the phantoms it calls up grow fainter and fainter, till they are wholly dispelled. But this applies only to one class of images. The ghost of Banquo, for instance, may pale away and vanish utterly before the light of knowledge; but the air-drawn dagger of Macbeth is immortal like the mind itself. Knowledge cannot throw its illumination upon eternity, or dissipate the influences by which men feel they are surrounded. A candle brought into a darkened room discloses the material forms of the things in the midst of which we are standing, and which may have been involved, to our imagination, in a poetical mystery. But the light itself, as an unexplained wonder—its analogies with the flame of life—the modifications it receives from the faint gleam of the sky through the shadowed window—all are poetical materials, and of a higher character. Where one series of materials ends, another begins; and so on in infinite progression, till poetry seems to spurn the earth from beneath her foot—

Driving far off each thing of sin and guilt,
And in clear dream and solemn vision
Telling of things which no gross ear can hear;
Till oft converse with heavenly habitants
Begins to cast a beam on the outer shape—
The unpolluted temple of the mind,
And turn it by degrees to the soul's essence,
Till all be made immortal.

Science with us, however, is a business instead of an ambition; ingenuity a trade rather than a taste. We go on from discovery to discovery, from invention to invention, with an insatiate but prosaic spirit, which turns everything to a profitable and practical account—imprisoning the very lightning, that it may carry our messages over land and under sea! We do not stop to look, to listen, to feel, to exalt with a moral elevation the objects of our study, and snatch a spiritual enjoyment from imagination. All with us is material; and all would be even mean, but for the essential grandeur of the things themselves. And here comes the question: Is this material progress incompatible with spiritual progress? Is the poetry of life less abundant because the conveniences of life are more complete and admirable? Is man less a spirit of the universe because he is a god over the elements? We answer, No: the scientific and the prosaic spirit are both independent elements in the genius of the age; or, if there is a necessary connection, it is the converse of what is supposed—the restless mind in which the fervour of poetry has died, plunging into science for the occupation that is necessary to its happiness. Thus one age is merely poetical, another merely scientific; although here, of course, we use, for the sake of distinctness, the broadest terms, unmindful of the modifications ranging between these extreme points. The age, however, that has least poetry has most science, and *vice versa*.

But man, unlike the other denizens of the earth, has power over his own destiny. He is able to cultivate the poetical as if it were a plant; and if once convinced of its important bearing upon his enjoyment of the world, he will do so. The imagination may be educated as well as the moral sense, and the result of the advancement of the one as well as the other is an expansion of the mind, and an enlargement of the

capacity for happiness. The grand obstacle is precisely what we have now endeavoured to aid in removing—the common mistake as to the nature of the poetical, which it is customary to consider as something remote from, or antagonistic to, the business of life. So far from this, it is essentially connected with the moral feelings. It neutralises the conventionalisms of society, and makes the whole world kin. It enlarges the circle of our sympathies, till they comprehend, not only our own kind, but every living thing, and not only animate beings, but all created nature.

A DUEL IN 1830.

I HAD just arrived at Marseilles with the diligence, in which three young men, apparently merchants or commercial travellers, were the companions of my journey. They came from Paris, and were enthusiastic about the events which had lately happened there, and in which they boasted of having taken part. I was, for my part, quiet and reserved; for I thought it much better, at a time of such political excitement in the south of France, where party passions always rise so high, to do nothing that would attract attention; and my three fellow-travellers no doubt looked on me as a plain, common-place seaman, who had been to the luxurious metropolis for his pleasure or on business. My presence, it seemed, did not incommode them, for they talked on as if I had not been there. Two of them were gay, merry, but rather coarse boon-companions; the third, an elegant youth, blooming and tall, with luxuriant black curling hair, and dark soft eyes. In the hotel where we dined, and where I sat a little distance off, smoking my cigar, the conversation turned on various love-adventures, and the young man, whom they called Alfred, shewed his comrades a packet of delicately perfumed letters, and a superb lock of beautiful fair hair.

He told them, that in the days of July he had been slightly wounded, and that his only fear, while he lay on the ground, was that if he died, some mischance might prevent Clotilde from weeping over his grave. 'But now all is well,' he continued. 'I am going to fetch a nice little sum from my uncle at Marseilles, who is just at this moment in good-humour, on account of the discomfiture of the Jesuits and the Bourbons. In my character of one of the heroes of July, he will forgive me all my present and past follies: I shall pass an examination at Paris, and then settle down in quiet, and live happily with my Clotilde.' Thus they talked together; and by and by we parted in the court-yard of the coach-office.

Close by was a brilliantly illumined coffee-house. I entered, and seated myself at a little table, in a distant corner of the room. Two persons only were still in the saloon, in an opposite corner, and before them stood two glasses of brandy. One was an elderly, stately, and portly gentleman, with dark-red face, and dressed in a quiet coloured suit; it was easy to perceive that he was a clergyman. But the appearance of the other was very striking. He could not be far from sixty years of age, was tall and thin, and his gray, indeed almost white hair, which, however, rose from his head in luxurious fulness, gave to his pale countenance a peculiar expression that made one feel uncomfortable. The brawny neck was almost bare; a simple, carelessly-knotted black kerchief alone encircled it; thick, silver-gray whiskers met together at his chin; a blue frock-coat, pantaloons of the same colour, silk stockings, shoes with thick soles, and a dazzlingly-white waistcoat and linen, completed his equipment. A thick stick leant in one corner, and his broad-brimmed hat hung against the wall. There was a certain convulsive twitching of the thin lips of this person, which was very remarkable; and there seemed, when he looked fixedly, to be a smouldering fire in his large, glassy, grayish-blue

eyes. He was, it was evident, a seaman like myself—a strong onk that fate had shaped into a mast, over which many a storm had blustered, but which had been too tough to be shivered, and still defied the tempest and the lightning. There lay a gloomy resignation as well as a wild fanaticism in those features. The large bony hand, with its immense fingers, was spread out or clenched, according to the turn which the conversation with the clergyman took. Suddenly he stepped up to me. I was reading a royalist newspaper. He lighted his cigar.

'You are right, sir; you are quite right not to read those infamous Jacobin journals.' I looked up, and gave no answer. He continued: 'A sailor?'

'Yes, sir.'

'And have seen service?'

'Yes.'

'You are still in active service?'

'No.' And then, to my great satisfaction, for my patience was well-nigh exhausted, the examination was brought to a conclusion.

Just then, an evil destiny led my three young fellow-travellers into the room. They soon seated themselves at a table, and drank some glasses of champagne to Clotilde's health. All went on well; but when they began to sing the *Marseillaise* and the *Parisienne*, the face of the gray man began to twitch, and it was evident a storm was brewing. Calling to the waiter, he said with a loud voice: 'Tell those blackguards yonder not to annoy me with their low songs!'

The young men sprang up in a fury, and asked if it was to them he alluded.

'Whom else should I mean?' said the gray man with a contemptuous sneer.

'But we may drink and sing if we like, and to whom we like,' said the young man. '*Vive la République et vive Clotilde!*'

'One as blackguardly as the other!' cried the gray-beard tauntingly; and a wine-glass, that flew at his head from the hand of the dark-haired youth, was the immediate rejoinder. Slowly wiping his forehead, which bled and dripped with the spilled wine, the old man said quite quietly: 'To-morrow, at the Cap Verd!' and seated himself again with the most perfect composure.

The young man expressed his determination to take the matter on himself; that he alone would settle the quarrel, and promised to appear on the morrow at the appointed time. They then all departed noisily. The old man rose quietly, and turning to me, said: 'Sir, you have been witness to the insult; be witness also to the satisfaction. Here is my address: I shall expect you at five o'clock. Good-night, Monsieur l'Abbé! To-morrow, there will be one Jacobin less, and one lost soul the more. Good-night!' and taking his hat and stick, he departed. His companion the abbé followed soon after.

I now learned the history of this singular man. He was descended from a good family of Marseilles. Destined for the navy while still young, he was sent on board ship before the Revolution, and while yet of tender years. Later, he was taken prisoner; and after many strange adventures, returned in 1793 to France: was about to marry, but having been mixed up with the disturbances of Toulon, managed to escape by a miracle to England; and learned before long that his father, mother, one brother, a sister of sixteen years of age, and his betrothed, had all been led to the guillotine to the tune of the *Marseillaise*. Thirst for revenge, revenge on the detested Jacobins, was now his sole aim. For a long time he roved about in the Indian seas, sometimes as a privateer, at others as a slave-dealer; and was said to have caused the tricoloured flag much damage, while he acquired a considerable fortune for himself. With the return of the Bourbons, he came back to France, and settled at Marseilles. He lived, however, very retired, and employed his large fortune solely for

the poor, for distressed seamen, and for the clergy. Alms and masses were his only objects of expense. It may easily be believed, that he acquired no small degree of popularity among the lower classes and the clergy. But, strangely enough, when not at church, he spent his time with the most celebrated fencing-masters, and had acquired in the use of the pistol and the sword a dexterity that was hardly to be paralleled. In the year 1815, when the royalist reaction broke out in La Vendée, he roved about for a long time at the head of a band of followers. When at last this opportunity of cooling his rage was taken from him by the return of order, he looked out for some victim who was known to him by his revolutionary principles, and sought to provoke him to combat. The younger, the richer, the happier the chosen victim was, the more desirable did he seem. The landlord told me he himself knew of seven young persons who had fallen before his redoubted sword.

The next morning at five o'clock, I was at the house of this singular character. He lived on the ground-floor, in a small simple room, where, excepting a large crucifix, and a picture covered with black crape, with the date, 1794, under it, the only ornaments were some nautical instruments, a trombone, and a human skull. The picture was the portrait of his guillotined bride; it remained always veiled, excepting only when he had slaked his revenge with blood; then he uncovered it for eight days, and indulged himself in the sight. The skull was that of his mother. His bed consisted of the usual hammock slung from the ceiling. When I entered, he was at his devotions, and a little negro brought me meanwhile a cup of chocolate and a cigar. When he had risen from his knees, he saluted me in a friendly manner, as if we were merely going for a morning walk together; afterwards he opened a closet, took out of it a case with a pair of English pistols, and a couple of excellent swords, which I put under my arm; and thus provided, we proceeded along the quay towards the port. The boatmen seemed all to know him. 'Peter, your boat!' He seated himself in the stern.

'You will have the goodness to row,' he said; 'I will take the tiller, so that my hand may not become unsteady.'

I took off my coat, rowed away briskly, and as the wind was favourable, we hoisted a sail, and soon reached Cap Verd. We could remark from afar our three young men, who were sitting at breakfast in a garden not far from the shore. This was the garden of a *restaurateur*, and was the favourite resort of the inhabitants of Marseilles. Here you find excellent fish; and also, in high perfection, the famous *bollebresse*, a national dish in Provence, as celebrated as the *olla podrida* of Spain. How many a love-meeting has occurred in this place! But this time it was not Love that brought the parties together, but Hate, his step-brother; and in Provence the one is as ardent, quick, and impatient as the other.

My business was soon accomplished. It consisted in asking the young men what weapons they chose, and with which of them the duel was to be fought. The dark-haired youth—his name was M—L—insisted that he alone should settle the business, and his friends were obliged to give their word not to interfere.

'You are too stout,' he said to the one, pointing to his portly figure; 'and you—to the other—are going to be married; besides, I am a first-rate hand with the sword. However, I will not take advantage of my youth and strength, but will choose the pistol, unless the gentleman yonder prefers the sword.'

A movement of convulsive joy animated the face of my old captain: 'The sword is the weapon of the French gentleman,' he said; 'I shall be happy to die with it in my hand.'

'Be it so. But your age?'

'Never mind; make haste, and *en garde*.'

It was a strange sight: the handsome young man on one side, overbearing confidence in his look, with his youthful form, full of grace and suppleness; and opposite him that long figure, half naked—for his blue shirt was furled up from his sinewy arm, and his broad, scarred breast was entirely bare. In the old man, every sinew was like iron wire: his whole weight resting on his left hip, the long arm—on which, in sailor fashion, a red cross, three lilies, and other marks, were tattooed—held out before him, and the cunning, murderous gaze rivetted on his adversary.

'Twill be but a mere scratch,' said one of the three friends to me. I made no reply, but was convinced beforehand that my captain, who was an old practitioner, would treat the matter more seriously. Young L—, whose perfumed coat was lying near, appeared to me to be already given over to corruption. He began the attack, advancing quickly. This confirmed me in my opinion; for although he might be a practised fencer in the schools, this was proof that he could not frequently have been engaged in serious combat, or he would not have rushed forwards so incautiously against an adversary whom he did not as yet know. His opponent profited by his ardour, and retired step by step, and at first only with an occasional ward and half thrust. Young L—, getting hotter and hotter, grew flurried; while every ward of his adversary proclaimed, by its force and exactness, the master of the art of fence. At length the young man made a lunge; the captain parried it with a powerful movement, and, before L— could recover his position, made a thrust in return, his whole body falling forward as he did so, exactly like a picture at the Académie des Armes—'the hand elevated, the leg stretched out'—and his sword went through his antagonist, for nearly half its length, just under the shoulder. The captain made an almost imperceptible turn with his hand, and in an instant was again *en garde*. L— felt himself wounded; he let his sword fall, while with his other hand he pressed his side; his eyes grew dim, and he sank into the arms of his friends. The captain wiped his sword carefully, gave it to me, and dressed himself with the most perfect composure. 'I have the honour to wish you good-morning, gentlemen: had you not sung yesterday, you would not have had to weep to-day;' and thus saying, he went towards his boat. 'Tis the seventeenth!' he murmured; 'but this was easy work—a mere greenhorn from the fencing-schools of Paris. 'Twas a very different thing when I had to do with the old Bonapartist officers, those brigands of the Loire.' But it is quite impossible to translate into another language the fierce energy of this speech. Arrived at the port, he threw the boatman a few pieces of silver, saying: 'Here, Peter; here's something for you.'

'Another requiem and a mass for a departed soul, at the church of St Gèneviève—is it not so, captain? But that is a matter of course.' And soon after we reached the dwelling of the captain.

The little negro brought us a cold pasty, oysters, and two bottles of *vin d'Artois*. 'Such a walk betimes gives an appetite,' said the captain gaily. 'How strangely things fall out!' he continued in a serious tone. 'I have long wished to draw the crape veil from before that picture, for you must know I only deem myself worthy to do so when I have sent some Jacobin or Bonapartist into the other world, to crave pardon from that murdered angel; and so I went yesterday to the coffee-house with my old friend the abbé, whom I knew ever since he was field-preacher to the Chouans, in the hope of finding a victim for the sacrifice among the readers of the liberal journals. The confounded waiters, however, betray my intention; and when I am there,

nobody will ask for a radical paper. When you appeared, my worthy friend, I at first thought I had found the right man, and I was impatient—for I had been waiting for more than three hours for a reader of the *National* or of *Figaro*. How glad I am that I at once discovered you to be no friend of such infamous papers! How grieved should I be, if I had had to do with you instead of with that young fellow!' For my part, I was in no mood even for self-felicitations. At that time, I was a reckless young fellow, going through the conventionalisms of society without a thought; but the event of the morning had made even me reflect.

'Do you think he will die, captain?' I asked: 'is the wound mortal?'

'For certain!' he replied with a slight smile. 'I have a knack—of course for Jacobins and Bonapartists only—when I thrust *en quarte*, to draw out the sword by an imperceptible movement of the hand, *en tierce*, or *vice versa*, according to circumstances; and thus the blade turns in the wound—and that kills; for the lung is injured, and mortification is sure to follow.'

On returning to my hotel, where L— also was staying, I met the physician, who had just visited him. He gave up all hope. The captain spoke truly, for the slight movement of the hand and the turn of the blade had accomplished their aim, and the lung was injured beyond the power of cure. The next morning early L— died. I went to the captain, who was returning home with the abbé. 'The abbé has just been to read a mass for him,' he said; 'it is a benefit which, on such occasions, I am willing he should enjoy—more, however, from friendship for him, than out of pity for the accursed soul of a Jacobin, which in my eyes is worth less than a dog's! But walk in, sir.'

The picture, a wonderfully lovely maidenly face, with rich curls falling around it, and in the costume of the last ten years of the preceding century, was now unveiled. A good breakfast, like that of yesterday, stood on the table. With a moistened eye, and turning to the portrait, he said: 'Thérèse, to thy memory!' and emptied his glass at a draught. Surprised and moved, I quitted the strange man. On the stairs of the hotel I met the coffin, which was just being carried up for L—; and I thought to myself: 'Poor Clotilde! you will not be able to weep over his grave.'

THE TREE OF SOLOMON.

Wide forests, deep beneath Maldivia's tide,
From withering air the wondrous fruitage hide;
There green-haired nereids tend the bowery dells,
Whose healing produce poison's rage expels.

The Lusid.

If Japan be still a sealed book, the interior of China almost unknown, the palatial temple of the Grand Lama unvisited by scientific or diplomatic European—to say nothing of Madagascar, the steppes of Central Asia, and some of the islands of the Eastern Archipelago—how great an amount of marvel and mystery must have enveloped the countries of the East during the period that we now term the middle ages! By a long and toilsome overland journey, the rich gold and sparkling gems, the fine muslins and rustling silks, the pungent spices and healing drugs of the Morning Land, found their way to the merchant princes of the Mediterranean. These were not all. The enterprising traversers of the Desert brought with them, also, those tales of extravagant fiction which seem to have ever had their birthplace in the prolific East. Long after the time that doubt—in not a few instances the parent of knowledge—had, by throwing cold water on it,

extinguished the last funeral pyre of the ultimate Phoenix, and laughed to scorn the gigantic, gold-grubbing pismires of Pliny; the Roc, the Valley of Diamonds, the mountain island of Loadstone, the potentiality of the Talisman, the miraculous virtues of certain drugs, and countless other fables, were accepted and believed by all the nations of the West. One of those drugs, seldom brought to Europe on account of its great demand among the rulers of the East, and its extreme rarity, was a nut of alleged extraordinary curative properties—of such great value, that the Hindoo traders named it *Trevanchere*, or the Treasure—of such potent virtue, that Christians united with Mussulmen in terming it the Nut of Solomon. Considered a certain remedy for all kinds of poison, it was eagerly purchased by those of high station at a period when that treacherous destroyer so frequently mocked the steel-clad guards of royalty itself—when poisoning was the crime of the great, before it had descended from the corrupt and crafty court to the less ceremonious cottage. Nor was it only as an antidote that its virtues were famed. A small portion of its hard and corneous kernel, triturated with water in a vessel of porphyry, and mixed, according to the nature of the disease and skill of the physician, with the powder of red or white coral, ebony, or stag's horns, was supposed to be able to put to flight all the maladies that are the common lot of suffering humanity. Even the simple act of drinking pure water out of a part of its polished shell was esteemed a salutary remedial process, and was paid for at a correspondingly extravagant price. Doubtless, in many instances it did effect cures; not, however, by any peculiar inherent sanative property, but merely through the unbounded confidence of the patient: similar cases are well known to medical science; and at the present day, when the manufacture and sale of an alleged universal heal-all is said to be one of the shortest and surest paths that lead to fortune—when in our own country 'the powers that be' encourage rather than check such wholesale empiricism—we cannot consistently condemn the more ancient quack, who having, in all faith, given an immense sum for a piece of nut-shell, remunerated himself by selling draughts of water out of it to his believing dupes. The extraordinary history of the nut, as it was then told, assisted to keep up the delusion. The Indian merchants said, that there was only one tree in the world that produced it; that the roots of that tree were fixed, 'where never fathom-line did touch the ground,' in the bed of the Indian Ocean, near to Java, among the Ten Thousand Islands of the far East; but its branches, rising high above the waters, flourished in the bright sunshine and free air. On the topmost bough dwelt a griffin, that sallied forth every evening to the adjacent islands, to procure an elephant or rhinoceros for its nightly repast; but when a ship chanced to pass that way, his griffinship had no occasion to fly so far for a supper. Attracted by the tree, the doomed vessel remained motionless on the waters, until the wretched sailors were, one by one, devoured by the monster. When the nuts ripened, they dropped off into the water, and, carried by winds and currents to less dangerous localities, were picked up by mariners, or cast on some lucky shore. What is this but an Eastern version—who dare say it is not the original?—of the more classical fable of the dragon and the golden fruit of the Hesperides?

Time went on. Vasco de Gama sailed round the Cape of Good Hope, and a new route was opened to Eastern commerce. The Portuguese, who encountered the terrors of the Cape of Storms, were not likely to be daunted by a griffin; yet, with all their endeavours, they never succeeded in discovering the precious tree. By their exertions, however, rather more of the drug was brought to Europe than had previously been; still there was no reduction in its estimated value. In the

East, an Indian potentate demanded a ship and her cargo as the price of a perfect nut, and it was actually purchased on the terms; in the West, the Emperor Rodolph offered 4000 florins for one, and his offer was contemptuously refused; while invalids from all parts of Europe performed painful pilgrimages to Venice, Lisbon, or Antwerp, to enjoy the inestimable benefit of drinking water out of pieces of nut-shell! Who may say what adulterations and tricks were practised by dishonest dealers, to maintain a supply of this costly medicine? but, as similar impositions are not unknown at the present day, we may as well pass lightly over that part of our subject.

The English and Dutch next made their way to the Indian Ocean; yet, though they sought for the invaluable Tree of Solomon, with all the energy supplied by a burning thirst for gain, their efforts were as fruitless and unsuccessful as those of the Portuguese. Strange tales, too, some of these ancient mariners related on their return to Europe: how, in the clear waters of deep bays, they had observed groves of those marvellous trees, growing fathoms down beneath the surface of the placid sea. Out of a mass of equally ridiculous reports, the only facts then attainable were at length sifted: these were, that the tree had not been discovered growing in any locality whatever; that the nut was sometimes found floating on the Indian Ocean, or thrown on the coast of Malabar, but more frequently picked up on the shores of a group of islands known as the Maldives; from the latter circumstance, the naturalists of the day termed it *Cocus Maldivicus*—the Maldivian cocoa-nut. Garcius, surnamed Ab Horto (of the garden), on account of his botanical knowledge, a celebrated authority on drugs and spices, who wrote in 1563, very sensibly concluded that the tree grew on some undiscovered land, from whence the nuts were carried by the waves to the places where they were found; other writers considered it to be a genuine marine production; while a few shrewdly suspected that it really grew on the Maldives. Unfortunately for the Maldivians, this last opinion prevailed in India. In 1607, the king of Bengal, with a powerful fleet and army, invaded the Maldives, conquered and killed their king, ransacked and plundered the islands, and, having crammed his ships with an immense booty, sailed back to Bengal—without, however, discovering the Tree of Solomon, the grand object of the expedition. Curiously enough, we are indebted to this horrible invasion for an interesting book of early Eastern travel—the Bengalese king having released from captivity one Pyrrard de Laval, a French adventurer, who, six years previously, had suffered shipwreck on those inhospitable islands. Laval's work dispelled the idea that the nut grew upon the Maldives. He tells us, that it was found floating in the surf, or thrown up on the sea-shore only; that it was royal property; and whenever discovered, carried with great ceremony to the king, a dreadful death being the penalty of any subject possessing the smallest portion of it.

The leading naturalists of the seventeenth century having the Maldives thus, in a manner, taken away from beneath their feet, took great pains to invent a local habitation for this wonderful tree; and at last they, pretty generally, came to the conclusion, that the vast peninsula of Southern Hindostan had at one time extended as far as the Maldives, but by some great convulsion of nature, the intermediate part between those islands and Cape Comorin had sunk beneath the waters of the ocean; that the tree or trees had grown thereon, and still continued to grow on the submerged soil; and the nuts when ripe, being lighter than water, rose to the surface, instead—as is the habit of supermarine arboreal produce—of falling to the ground. Scarcely could a more splendid illustration of the fallacies of hypothetical reasoning be found, than the pages that contain this specious and far-fetched

argument. Even the celebrated Rumphius, who wrote so late as the eighteenth century, assures his readers that 'the *Calappa laut*, the Malay term for the nut, 'is not a terrestrial production, which may have fallen by accident into the sea, and there become hardened, as Garcias ab Horto relates, but a fruit, growing itself in the sea, whose tree has hitherto been concealed from the eye of man.' He also denominates it 'the wonderful miracle of nature, the prince of all the many rare things that are found in the sea.'

In the fulness of time, knowledge is obtained and mysteries are revealed. Chemistry and medicine, released from the tedious but not useless apprenticeship they had served to alchemy and empiricism, set up on their own account, and as a consequence, the 'nut of the sea' soon lost its European reputation as a curative, though it was still considered a very great curiosity, and the unsettled problem of its origin formed a famous stock of building materials for the erectors of theoretical edifices. In India and China, it retained its medicinal fame, and commanded a high price. Like everything else that is brought to market, the nuts varied in value. A small one would not realise more than L.50, while a large one would be worth L.120; those, however, that measured as much in breadth as in length were most esteemed, and one measuring a foot in diameter was worth L.150 sterling money. Such continued to be the prices of these nuts for two centuries after the ships of Europe had first found their way to the seas and lands of Asia. But a change was at hand. In the year 1770, a French merchant-ship entered the port of Calcutta. The motley assemblage of native merchants and tradesmen, Baboos and Banians, Dobashes, Dobies, and Dingy-wallahs, that crowd a European vessel's deck on her first arrival in an Eastern port, were astounded when, to their eager inquiries, the captain replied that his cargo consisted of *cocos de mer*.^{*} Scarcely could the incredulous and astonished natives believe the evidence of their own eyesight, when, on the hatches being opened, they saw that the ship was actually filled with this rare and precious commodity. Rare and precious, to be so no longer. Its price instantaneously fell; persons who had been the fortunate possessors of a nut or two, were ruined; and so little did the French captain gain by his cargo, that he disclosed the secret of its origin to an English mercantile house, which completed the utter downfall of the nut of Solomon, by landing another cargo of it at Bombay during the same year.

A singular circumstance in connection with the discovery of the tree, a complete exemplification of the good old tale, *Eyes and no Eyes*, is worthy of record, as a lesson to all, that they should ever make proper use of the organs which God has bestowed upon them for the acquisition of useful knowledge. Mahé de la Bourdonnais, one of the best and wisest of French colonial governors, whose name, almost unknown to history, is embalmed for ever in St Pierre's beautiful romance of *Paul and Virginia*, sent from the Isle of France, in 1748, a naval officer named Picault, to explore the cluster of islands now known as the Seychelles. Picault made a pretty correct survey, and in the course of it discovered some islands previously unknown; one of these he named Palmiers, on account of the abundance and beauty of the palm-trees that grew upon it; that was all he knew about them. In 1768, a subsequent governor of the Isle of France sent out another expedition, under Captain Duchemin, for a similar purpose. Barré, the hydrographer of this last expedition, landing on Palmiers, at once discovered that the palms, from which the island had, a quarter of a century previously, received its name, produced the famous and long-sought-for *cocos de mer*. Barré informed Duchemin,

and the twain kept the secret to themselves. Immediately after their return to the Isle of France, they fitted out a vessel, sailed to Palmiers, and having loaded with nuts, proceeded to Calcutta. How their speculation turned out, we have already related. We should add that Duchemin, in his vain expectation of making an immense fortune by the discovery, considering that the name of the island might afford future adventurers a clue to his secret, artfully changed it to Praslin, the name of the then intendant of marine, which it still retains.

We shall speak no more of the Tree of Solomon; it is the *Lodoicea Seychellarum*—the double cocoa-nut of the Seychelles—as modern botanists term it, that we have now to deal with. As its name implies, it is a palm, and one of the most nobly-graceful of that family, which have been so aptly styled by Linnæus the princes of the vegetable kingdom. Its straight and rather slender-looking stem, not more than a foot in diameter, rises, without a leaf, to the height of from 90 to 100 feet, and at the summit is superbly crowned with a drooping plume, consisting of about a score of magnificent leaves, of a broadly-oval form. These leaves, the larger of which are twenty feet in length and ten in width, are beautifully marked with regular folds, diverging from a central supporting chine; their margins are more or less deeply serrated towards the extremities; and they are supported by footstalks nearly as long as themselves. Every year there forms, in the central top of the tree, a new leaf, which, closed like a fan, and defended by a downy, fawn-coloured covering, shoots up vertically to a height of ten feet, before it, expanding, droops gracefully, and assumes its place among its elder brethren; and as the imperative rule pervades all nature, that, in course of time, the eldest must give place unto their juniors, the senior lowest leaf annually falls withered to the ground, yet leaving a memento of its existence in a distinct ring or scar upon the parent trunk. It is clear, then, that by the number of these rings the age of the tree can be accurately determined; some veterans shew as many as 400, without any visible signs of decay; and it seems that about the age of 130 years, the tree attains its full development.

As in several other members of the palm family, the male and female flowers are found on different individuals. The female tree, after attaining the age of about thirty years, annually produces a large drupe or fruit-bunch, consisting of five or six nuts, each enveloped in an external husk, not dissimilar in form and colour to the coat of the common walnut, but of course much larger, and proportionably thicker. The nut itself is about a foot in length; of an elliptic form; at one end obtuse, at the other and narrower end, cleft into two or three, sometimes even four lobes, of a rounded form on their outsides, but flattened on the inner. It is exceedingly difficult to give a popular description when encumbered by the technicalities of science; we must try another method. Let the reader imagine two pretty thick vegetable marrows, each a foot long, joined together, side by side, and partly flattened by a vertical compression, he will then have an idea of the curious form of the double cocoa-nut. Sometimes, as we have mentioned, a nut exhibits three lobes; let the reader imagine the end of one of the marrows cleft in two, and he will have an idea of the three-lobed nut; and if he imagines two more marrows placed side by side, and compressed with and on the top of the former two, he will then have an idea of the four-lobed nut. In fact, almost invariably, the four-lobed nut parts in the middle, forming two of the more common two-lobed nuts, only distinguishable by the flatness of their inner sides from those that grew separately. When green, they contain a refreshing, sweetish, jelly-like substance, but when old, the kernel is so hard that it cannot be cut with a knife.

The enormous fruit-bunches, weighing upwards of fifty pounds, hang three or four years on the tree

^{*} *Cocco-nuts of the sea*—the French appellation of the nut.

before they are sufficiently ripened to fall down; thus, though only one drupe is put forth each season, yet the produce of three or four years, the aggregate weight of which must be considerable, burdens the stem at one time. This great weight, suspended at the top of the lofty and almost disproportionately slender stem, causes the tree to rock gracefully with the slightest breeze; the agitated leaves creating a pleasing noise, somewhat similar to that of a distant waterfall. Some French writers have enthusiastically alluded to this rustling sound as a delightful adjunct of the interesting scene; nor have our English travellers spoken in less glowing language. 'Growing in thousands,' says Mr Harrison, 'close to each other, the sexes intermingled, a numerous offspring starting up on all sides, sheltered by the parent plants, the old ones fallen into the sear and yellow leaf, and going fast to decay to make room for the young trees, presents to the eye a picture so mild and pleasing, that it is difficult not to look upon them as animated objects, capable of enjoyment, and sensible of their condition.'

Though no longer producing a drug of great value for the exclusive use of the wealthy, the double cocoanut of the Seychelles affords many humbler benefits to the inhabitants of those islands. The trunk, when split and cleared of its soft, fibrous interior, serves to make water-troughs and palisades. The immense leaves are used, in that fine climate, as materials for building: not only do they make an excellent thatch, but they are also employed for walls. With one hundred leaves, a commodious dwelling, including doors, windows, and partitions, may be constructed. Baskets and brooms are made from the ribs of the leaves and the fibres of their footstalks. The young leaf, previous to its expanding, is soft, and of a pale-yellow colour; in this state it is cut into longitudinal stripes, and plaited into hats; while the downy substance by which it is covered, is found valuable for stuffing beds and pillows. Vessels, of various forms and uses, are made out of the light, strong, and durable nut-shells. When preserved whole, with merely a perforation at the top, they are used to carry water, some holding nearly three gallons. When divided, the parts serve, according to their size and shape, for platters, dishes, or drinking-cups. Being jet-black, and susceptible of a high polish, they are often curiously carved, and mounted with the precious metals, to form sugar-basins, toilet-dishes, and other useful and ornamental articles for the dwellings of the tasteful and refined.

The group of islands termed the Seychelles lie to the northward and eastward of Madagascar, in the latitude of 6 degrees south of the equinoctial. The tree, in its natural state, is found on three small, rocky, and mountainous islands only—Praslin, containing about 3000 acres; Curieuse, containing but 1000; and Round Island, smaller still; all three lying within a few hundred yards of each other. These islands are about 900 miles distant from the Maldives; and as *Jarrias ab Horto*, in the sixteenth century, supposed, he nuts, many of which grow on rocky precipices overhanging the sea, drop into the waves, and are transported by the prevailing currents to other shores. It is a remarkable fact, that the trees will not flourish on any other of the adjacent islands of the Seychelles group. Many have been planted, but they merely vegetate, and are wretchedly inferior to the splendid natural trees of Praslin and Curieuse. From the time that the nut falls from the tree, a year elapses before it germinates; it only requires to lie on the ground without being covered, for the germ shoots downwards, forming a root, from which ascends the *stipule* of the future plant.

Several attempts have been made to grow this tree in some of the larger horticultural establishments in Great Britain, but hitherto without success. Hopes, however, are now entertained; for the interesting

spectacle of a double cocoa-nut in the act of germination may be witnessed at this moment in the national gardens at Kew.

FALSE POLITICAL ECONOMY.

LEGISLATIVE PROTECTION AGAINST FRAUD.

THERE is a proverb full of wisdom—as these brief embodiments of experience often are—to the effect that in commerce 'the buyer's eye is his merchant.' It has found its way into our legal text-books, to express a principle which modern law has had much in view—that people should look to their own skill and knowledge in making their purchases, and should not trust to the legislature to protect them, by interference and penalties, from purchasing unworthy commodities. Undoubtedly, fraud, when it occurs, must be punished. If a merchant sell by sample, and intentionally give a different article—if a dog-dealer clothe a cur in the skin of a departed lap-dog, and sell him warranted an undoubted Blenheim spaniel—there should be some punishment for the fraud. It will not be found expedient, however, to go far, even in such clear cases. In too entirely superseding the buyer's eye, and substituting the judge's, we remove a very vigilant check on fraud. If people never bought Blenheim spaniels without an ample knowledge of the animal's character and appearance, followed by minute observation, it would do more to prevent fraud in this small by-article of commerce than a host of penal statutes.

And when we come to less palpable imperfections in goods, it will be seen that legislation is quite incapable of coping with them. If every thrifty housewife, whose last bought bushel of potatoes is more waxy than they ought to be—if every shabby dandy, who has bought a glossy satin hat, 'warranted superfine, price only 5s,' and who finds it washed into a kind of dingy serge by the next shower—had his action for the infliction of penalties, it would be a more litigious world even than it is. With thimble-riggers, chain-droppers, fortune-telling gipsies, and the like, the law wages a most unproductive war. Penal statutes and the police do little to put them down, while there are fools whose silly selfishness or vanity makes them ready dupes: if these fools would become wise and prudent, all the penalties might be at once dispensed with. But only imagine the state of litigational confusion in which this country would be plunged, if every tradesman who sold 'an inferior article,' which had a fair and attractive appearance, could be subject to penal proceedings!

Yet our ancestors made this attempt; and under the early monarchs of England there were passed a number of statutes, which vainly endeavoured to compel every manufacturer and dealer to be honest. The wool-trade was an especial favourite of this kind of legislation. Indeed, if any one be in search of violent legislative attempts to force trade into artificial channels, he will be very sure to find them if he turn up the acts on the wool and woollen trade. They would fill some volumes by themselves. One great object of the government, was to prohibit the exportation of wool, to export it only in the manufactured article, and to sell that only for gold. A tissue of legislation of the most complicated kind was passed to establish these objects. Costly arrangements were made, by which not only in this country, but also in others, the sale of the woollens was conducted only by Englishmen. This, however, is not our immediate subject—it relates rather to the curious efforts to make the manufacturers produce a sound article.

An act of the 13th of Richard II. (1389), gives this melancholy account of the dishonesty of certain cloth-makers, and provides a penal remedy: 'Forasmuch as divers plain clothes, that be wrought in the counties of Somerset, Dorset, Bristol, and Gloucester, be tacked and folded together, and set to sale, of the which clothes w-

great part be broken, brused, and not agreeing in the colour; neither be according to breadth, nor in no manner to the part of the same clothes showed outwards, but be falsely wrought with divers wools, to the great deceit, loss, and damage, of the people, in so much, that the merchants who buy the same clothes, and carry them out of the realm to sell to strangers, be many times in danger to be slain, and sometimes imprisoned, and put to fine and ransom by the same strangers, and their said clothes burnt or forfeit, because of the great deceit and falsehood that is found in the said clothes when they be untacked and opened, to the great slander of the realm of England. It is ordained and assented, that no plain cloth, tacked nor folded, shall be set to sale within the said counties; but that they be opened, upon pain to forfeit them, so that the buyers may see them and know them, as it is used in the county of Essex.' One would think, that if the buyers found themselves habitually cheated by made-up goods, they would find the remedy themselves, by insisting on seeing them, and declining, according to a Scottish saying, to buy 'a pig in a poke.' Another clause of the same act seems equally gratuitous: 'Provided always, that after the merchants have bought the same clothes to carry, and do carry them out of the realm, they may tack them and fold them at their pleasure, for the more easy carriage of them.' What a very accommodating statute!

And it really is reasonable, in comparison with other enactments on the same subject. In the ninth year of Henry VIII., for instance, an act was passed for 'avoiding deceits in making of woollen clothes,' containing a whole series of troublesome regulations, such as the following: 'That the wool which shall be delivered for or by the clothier to any person or persons, for breaking, combing, carding, or spinning of the same, the delivery therefore shall be by even just poise and weight of averdupois, sealed by authority, not exceeding in weight after the rate of xii pound seemed wool, above one quarter of a pound for the waste of the same wool, and in none other manner; and that the breaker or comber do deliver again to the same clothier the same wool so broken and combed, and the carder and spinner to deliver again to the said clothier yarn of the same wool, by the same even just and true poise and weight (the waste thereof excepted), without any part thereof concealing, or any more oil-water, or other thing put thereunto deceivable.

'Item, that the weaver which shall have the weaving of any woollen yarn to be webbed into cloth, shall weave, work, and put into the web, for cloth to be made thereof, as much and all the same yarn as the clothier, or any person for him, shall deliver to the same weaver, with his used mark put to the same, without changing, or any parcel thereof leaving out of the said web; or that he restore to the same clothier the surplus of the same yarn, if any shall be left not put in the same web, and without any more oil brine, moisture, dust, sand, or other thing deceivably putting or casting to the same web, upon pain to forfeit for every default three shillings and four pence.

'Item, that no manner of person buy any coloured wool, or coloured woollen yarn, of any carder, spinner, or weaver, but only in open market, upon pain of forfeiture of such wool and yarn so bought.' And so on: these, in fact, are but the beginning of a series of regulations, which it would tire the reader to peruse throughout.

One would think, that shoes and other leather manufactures are among the last things that require to be made sufficient by legislation. The ill-made shoes wear out, and the purchaser, if he be wise, will not go again to the same shop. Parliament, however, did not leave him in the matter to the resources of his own wisdom. By a statute of the 18th of Richard II.,

it is provided: 'Forasmuch as divers shoemakers and cordwainers use to tan their leather, and sell the same falsely tanned—also make shoes and boots of such leather not well tanned, and sell them as dear as they will, to the great deceit of the poor commons—it is accorded and assented, that no shoemaker nor cordwainer shall use the craft of tanning, nor tanner the craft of shoemaking; and he that doth contrary to this act, shall forfeit to the king all his leather so tanned, and all his boots and shoes.'

Fifty-two years later—in the year 1485, it was found that the people were still cheated with bad boots and shoes—especially, we doubt not, when they bought them cheap—and the legislature, pondering on a possible remedy, thought they might find it in further subdivision, and prohibiting tanners from currying their leather; and so it is enacted, 'that where tanners in divers parts of this realm use within themselves the mystery of currying and blacking of leather insufficiently, and also leather insufficiently tanned, and the same leather so insufficiently wrought, as well in tanning as in currying and blacking, they put to sale in divers fairs and markets, and other places, to the great deceit and hurt of liege people'—so no tanner is to 'use the mystery of a currier, nor black no leather to be put to sale, under the forfeiture of every hyde,' &c.

Let us now introduce our readers to a legislative protection against frauds of a more dire and mysterious character, in the shape of an act passed in the sixth year of Edward VI., 'for stuffing of feather-beds, bolsters, mattresses, and cushions.' Our readers, we hope, will not suppose—as the words might lead them to infer—that these articles are to be stuffed with the act; on the contrary, it would be highly penal so to do. The chief provisions are: 'For the avoiding of the great deceit used and practised in stuffing of feather-beds, bolsters, pillows, mattresses, cushions, and quilts—be it enacted, that no person or persons whatsoever shall make (to the intent to sell, or offer to be sold) any feather-bed, bolster, or pillow, except the same be stuffed with dry-pulled feathers, or clean down only, without mixing of scalded feathers, fen-down, thistle-down; sand, lime, gravel, unlawful or corrupt stuff, hair, or any other, upon pain of forfeiture,' &c. One would like to know what 'unlawful or corrupt stuff' is, and whether the corruptness be physical through putridity, or merely metaphysical and created, like the unlawfulness by statute. The act provides further, that after a certain day no person 'shall make (to the intent to sell, or offer, or put to sale) any quilt, mattress, or cushions, which shall be stuffed with any other stuff than feathers, wool, or flocks alone,' on pain of forfeiture.

But the most stringent enactments for the protection of the public against such wholesale deceptions appear to have been in the article of fustian; and perhaps the hidden adulterations that suggested the enactments, may be the reason why unsound reasonings and hollow speeches are called fustian. There is something mysteriously awful in the act of the eleventh year of Henry VII., called 'A remedy to avoid deceitful slights used upon fustians.' It begins thus:

'That whereas fustians brought from the parts beyond the sea unshorn into this realm, have been and should be the most profitable cloth for doublets and other wearing clothes greatly used among the common people of this realm, and longest have endured of anything that have come into the same realm from the said parts to that intent—for that the cause hath been that such fustians afore this time hath been truly wrought and shorn with the broad sheare, and with no other instruments or deceitful mean used upon the same. Now so it is, that divers persons, by subtlety and undue slights and means, have deceivably imitated and contrived instruments of iron, with which irons,

in the most highest and secret places of their houses, they strike and draw the said irons on the said fustians unshorn—by means whereof they pluck off both the nap and cotton of the said fustians, and break commonly both the ground and threads in sunder; and after, by crafty sleeking, they make the same fustians to appear to the common people fine, whole, and sound; and also they raise up the cotton of such fustians, and then take a light candle, and set it on the fustian burning, which singeth and burneth away the cotton of the same fustian from the one end to the other down to the hard threads, instead of shearing; and after that put them in colour, and so subtly dress them, that their false work cannot be espied, without it be workmen shearers of such fustian, or the wearers of the same.'

Many penalties and forfeitures are laid on the persons who so treacherously corrupt honest fustian. But one is apt to fear, that the accurate account given of the process may have induced some people to follow it, who would not have thought of doing so but for the instruction contained in the act for abolishing it.

Our manufacturing operatives have been justly censured for their occasional—and, to do them justice, it is but occasional—enmity to machinery. Sometimes it may be palliated, though not justified, by the hardship which is often, without doubt, suffered by those who have to seek a new occupation. We suspect, however, that the legislature is not entirely free from this kind of barbarous enmity. We are led to this supposition by finding, in the sixth year of Edward VI., an act 'for the putting down of gig-mills.' It sets out with the principle, that everything that deteriorates manufactured articles does evil, continuing: 'And forasmuch as in many parts of this realm is newly and lately devised, erected, builded, and used, certain mills called gig-mills, for the perching and burling of cloth, by reason whereof the true drapery of this realm is wonderfully impaired, and the cloth thereof deceitfully made by reason of the using of the said gig-mills'—and so provisions follow for their suppression. It is a general effect of machinery to fabricate goods less lasting than those which are handwrought, but with an accompanying reduction of price, which makes the machine produce by far the cheaper. We fear the legislature saw only the deterioration, and was not alive to the more than compensating facility of production.

VISIT TO THE ROYAL ITALIAN OPERA.

It is by the territorial division of labour that a country arrives most successfully at wealth and civilisation. Our hops are grown in Kent and Essex; Glasgow annually sends forth the engines of our steam fleets; Sunderland is the focus of our shipbuilding; Edinburgh, with her legion of professors, and her busy presses, is one vast academy. In short, each district does something peculiar to itself, while all avoid sending coal to Newcastle.

A large number of manufactures, particularly those of luxury, are peculiar to the metropolis, and one of the most prominent of this class is public amusement. Every season has its novelty, whether the opera of a great foreign composer, or the lectures of a literary lion; besides endless panoramas, dioramas, cosmoramas, and cycloramas, which bring home to John Bull the wonders of the habitable globe, and annihilate time and space for his delectation. We see the Paris of the Huguenots to the sound of Meyerbeer's blood-stirring trumpets; or gain companionship with Hogarth, Fielding, or Smollett as we listen to Thackeray; or, after paying our shilling in the Chinese Junk, are, to all intents and purposes, afloat in the Hoang Ho.

London is the place at which these amusements are manufactured and first presented, and at which the stamp is sought which enables a portion of them to pass current in the provinces, and make large returns

to the more fortunate speculators. In the metropolis, the vast capital afloat in such schemes is first cast on the waters, and a large amount annually sunk and engulfed for ever in the great vortex. The continued series of splendid fortunes which have been sacrificed in such schemes, would excite our astonishment that the fate of previous adventurers had not acted as a warning, if the moral of the gambling-table and the Stock Exchange were not always ready, by collateral illustration, to explain a riddle which would otherwise be insoluble.

Indisputably foremost of all the establishments which offer amusement to the London public, is the Royal Italian Opera, Covent Garden; and we say this without attempting to enter into the question of whether it has rightly or wrongly achieved a preponderance of vocal talent over the rival theatre. While noting, however, the combination of talent it presents, and the continued flow of capital it sends forth in the production of the highest class of works, we must at the same time express our admiration of the spirited efforts of Mr Lumley to sustain himself against such odds; and our hope that nothing will induce this gentleman to give up a rivalry which has been a stimulus to the exertions of the other house, and which has rendered London the musical capital of the world. Thus much premised, we sit down to give an account of a day spent at Covent Garden, devoted to a thorough examination of this vast establishment, from its extensive catacombs to the leads which overlook the panorama of London; persuaded as we are that the public has but an obscure idea of the capital, labour, and ingenuity expended in the production of what is visible to the eye of the audience. Access to the stage during rehearsal is strictly confined to the performers, although that is the least part of the exhibition; but by special favour, we were taken in charge by the chief mechanist, an individual provided with the necessary technical knowledge, as well as with a material bunch of keys to unlock all the mysteries of the place.

Our *debut* was made upon the stage, which we examined in its various parts and appendages while the ballet practice was proceeding. The curtain was up: the audience part of the house, from the pit to the ceiling, was covered with linen, in order to preserve the satin draperies from dust. Comparative darkness pervaded the vast space; but the front of the stage was illumined by a pipe of gas, pierced for jets, running over the orchestra from wing to wing; while a beam of sunlight, penetrating through the cords and pulleys of the upper regions, cast a strange lustre on the boards, as if it had come through green glass. Half a dozen chairs were placed in front of the stage, on one of which sat the ballet-master—a stout, bald-headed man, who beat time with his stick. A violinist played at his elbow the skeleton airs of the ballet music, while the male and female dancers executed their assigned parts; the stout bald-headed gentleman occasionally interrupting the rehearsal to suggest improvements, or to issue a peremptory reprimand to one of those pale, pretty things who were bounding across the stage in short muslin petticoats and faded white satin rehearsal chausseurs. 'Elle est folle!' 'Allez aux petites maisons!' sounded rather ungallant, if we did not know that an effective drill for so refractory a corps is not to be got through by the aid of the academy of compliments. The master himself, sulking the action to the word, occasionally started up, and making some *pas*, as an illustrative example, with his heels flying in the air, was certainly in a state of signal incongruity with his aspect, which, when seated, was that of a steady-looking banker's clerk from Lombard Street.

The width of the stage between the so-called fly-rails is 50 feet; while the depth from the footlights to the wall at the back, is 80 feet. But on extraordinary occasions, it is possible to obtain even a longer vista;

for the wall opposite the centre of the stage is pierced by a large archway, behind which, to the outer wall, is a space of 86 feet; so that by introducing a scene of a triumphal arch, or some other device, a depth of 100 feet can be obtained, leaving still a clear space of 16 feet behind the furthest scene, round the back of which processions can double. It would otherwise be difficult to comprehend how it is possible, as in the opera of *La Juive*, to manoeuvre here a procession of 894 persons, including a car drawn by eight horses.

The stage itself is covered all over with trap-doors and sliding panels, although it feels sufficiently firm to the tread; the depth from the boards to the ground below the stage is twenty-two feet, divided into two floors, the lower deck—if I may so call it—being also furnished with abundant hatchways down to the hold. On the left of the stage, facing the audience, is a room of good size, close to the flies; this is the property-room of the night, in which are accumulated, previous to the performance, all the articles required for that night, whether it be the toilette-table of a princess, or the pallet and water-jug of a dungeon prisoner. This apartment, the reader may easily understand, is quite distinct from the property store-room, which contains everything required for every opera, from the crown of the *Prophet of Munster* to the magpie's cage in *La Gazza Ladra*. There is one property, however, which is of too great dimensions to be transportable. The large and fine-toned organ, used in the *Prophète*, *Huguenots*, and *Robert le Diable*, is to the right of the stage, opposite the property-room; and the organist, from his position, being unable to see the baton of Mr Costa, takes the time from a lime-tree baton fixed to the organ, which is made to vibrate by machinery under the control of Mr Costa, from his place in the orchestra. It would take up too much space to enter more at large into the machinery used in theatrical entertainments; and at anyrate, the parallel slides, the pierced cylinder—by which a ripple is produced on water—and many other devices, however curious and interesting, could not be made intelligible without woodcuts.

Our conductor now provided himself with a lantern, in order to lead us to the regions under the stage; for, in consequence of the mass of inflammable material connected with a theatre, there are as strict regulations against going about with open lights as in a coal-pit addicted to carbonic acid gas. Descending a trap, we reached the so-called mazarine-floor, a corruption of the Italian *mezzanine*, from which the musicians have access to the orchestra. It is not much higher than the human stature; and hither descends that *Ateista Felnato*, Don Juan, or any other wight unlucky enough to be consigned to the infernal regions until the curtain drops. In this floor is a large apartment for the orchestra, in which are deposited the musical instruments in their cases; and beside it is the so-called pass-room, in which note is taken of the punctual arrival of performers.

Below this is the ground-floor, and below that, again, a vast extent of catacombs. One of these is the rubbish-vault, and this is of considerable size; for although dresses and properties are often made of the coarsest materials, and will not stand a close inspection—the problem to be solved being the combination of stage effect with economy—yet, on the other hand, their want of durability, and the constant production of new pieces, necessarily creates a large amount of waste; and for this accommodation must of course be provided.

Leaving the rubbish-vault, we examined the gasometer, and the remains of gas-works; for Covent Garden made its own gas, until an explosion took place, which suffocated several men. My conductor pointed out to me the spot where they attempted to stomp, having gone through a long corridor until

they were stopped by a dead wall, now pierced by a door. Near the gasometer is the hydraulic machine for supplying with water the tank on the top of the house; all the other services on this line of pipe are screwed off, and thus the water is forced to the top of the building. In the Queen's Theatre, Haymarket, a supply for the tank on the roof is obtained from a well which was sunk by Mr Lumley under the building, in consequence of the river company having raised his water-rate from L.60 to L.90. From the well, the water is forced up by a machine.

We next ascended a stair, flight after flight; then wound our way through a region of flies and pulleys; and then scrambled up ladders until we arrived at the tank itself, which is large enough to hold sufficient water to supply six engines for half an hour. It has long hose attached to it, ready, at the shortest notice, to have the water directed either over the scenery or the audience part. We now proceeded over the roof of the audience part, to what appeared to be a large well, fenced by a parapet; and looking down ten or twelve feet, saw below us the centre chandelier, the aperture, which would otherwise be unsightly, being closed by an open framework in Arabesque. Through this the chandelier is lighted by a long rod, having at the end a wire, to which is attached a piece of ignited sponge soaked in spirits of wine: the chandelier is raised and lowered at pleasure by a three-ton windlass.

Not less than eighty-five apartments, great and small, surround the stage or adjoin it, and are used as dressing-rooms, workshops, store-rooms, and offices. We first visited the dressing-room of Madame Grisi, nearest the stage, and it had the air of an elegant boudoir, hung and furnished in green and crimson; while another close beside it, fitted up in precisely the same style, was somewhat prematurely called the dressing-room of Mademoiselle Wagner. The dresses of the various performers, we may mention, are supplied by the management; but some of them, with large salaries, and priding themselves on appearing before the public in costly and well-fitting garments, choose to incur this expense themselves.

The sempstresses-room looks exactly like a large milliner's shop, and here we found a forewoman with eighteen assistants at work. Books of costumes are always at hand, so that a degree of historical accuracy is now attained in Opera costume, which materially assists the illusion; and no such anachronism is visible in Covent Garden as in a certain theatre across the Thames, where, instead of the Saracenic minarets of Cairo, this gorgeous Arab city is represented by pyramids, obelisks, and sphynxes. The painting-room of Covent Garden is a light and lofty apartment at the top of the house, and the name of Mr Grieve is a sufficient guarantee both for historical accuracy and artistic character. Scene-painting, as practised at Covent Garden, is a most systematic process: a coloured miniature of each scene is made on Bristol-board, and consigned to an album; then a larger miniature is made, and placed in a model of the Opera stage, on a large table, and from this the scenes themselves are executed. Near the painting-room is the working property-room, filled with carpenters, mechanists, smiths, painters, and other artificers—everything either before or behind the curtain being kept up, repaired, and altered by the people of the establishment.

We now proceeded to hear the rehearsal of the opera of *Lucia di Lammermoor*, and entering the stalls, found the orchestra full and nearly ready to commence, Mr Costa discussing a glass of port-wine and a sandwich, while the stage-manager was marshalling the people for the first tableau, the principal singers being seated on chairs at the side. What would most have struck those accustomed only to English theatricals, was the respectable appearance of the chorus, so

different from the ragamuffin troop that fill up the back-ground of an English scene. The Covent Garden chorus includes, at rehearsal, a considerable number of well-dressed men in shining hats and new paletots, many of whom are good music-teachers, not the less qualified for that business by the opportunities they have in this establishment of becoming familiar with the way in which the best works of the best masters are executed by the best artists.

The rehearsal over, we turned our attention to the audience part of the house, more particularly the Queen's box, of the privacy and splendour of which even old *habitués* have no idea. In the first place, Her Majesty has a separate court-yard for entrance, in which she may alight, which is a check not only upon obtrusive curiosity on the part of the public, but upon the evil disposed; for although one might naturally suppose, that if there is any individual who ought to enjoy immunity from danger or disrespect, it would be a lady who is exemplary in her public duties as a constitutional sovereign, as well as in those of a consort and mother—experience has shewn the fallaciousness of the idea.

The staircase is very noble, such as few mansions in London possess. Passing through the vestibule, we enter the grand drawing-room, in the centre of which is one of those tables that formed an ornament of the Exhibition last year. The drapery is of yellow satin damask. The principal feature of this drawing-room is the conservatory, which is separated from it by one vast sheet of plate-glass, the gas-light being contrived in such a way as to be unseen by those in the room, although bringing out the colours of the flowers with the greatest brilliancy.

Adjoining the drawing-room is the Queen's dressing-room; and between the grand drawing-room and the royal box is the little drawing-room, the walls of which are hung with blue satin damask, relieved by rich gilt ornaments, mouldings, and bronzes, in the style of Louis Quinze. The royal box itself is fitted up with crimson satin damask, a large arm-chair at the extreme right of the front of the box being the one Her Majesty usually occupies; but when she visits the theatre in state, fourteen boxes in the centre of the house, overlooking the back of the pit, are opened into one, involving a large amount of expense and trouble, which, however, is no doubt amply compensated by the extraordinary receipts of the night.

A private and separate entrance is not the exclusive privilege of royalty. The Duke of Bedford, as ground-lord, and Miss Burdett Coutts, who has likewise a box in perpetual freehold, have separate entrances, just under that of the Queen's box, with drawing-rooms attached, which are small and low-roofed, but sumptuously fitted up. Such were the principal objects appertaining to the audience part of the house.

Returning behind the scenes, the two principal public rooms are the manager's room and green-room, which both suggested recollections of old Covent Garden in its British drama-days. Unlike the audience part of the theatre, which has been entirely reconstructed, the stage part has only been refurnished—and yet not entirely refurnished—for in this very manager's room, where John Kemble used to play the potentate off the stage with as much dignity as on it, stands a clock with the following inscription: 'After the dreadful fire of Covent Garden Theatre, on the morning of September the 21st 1808, this clock was dug out of the ruins by John Saul, master-carpenter of the theatre, and repaired and set to work.' When we reached the green-room itself, what recollections crowded on me of the stars that glittered around the Kemble dynasty! In Costa, seated at the pianoforte, I saw the face of an honest man, who unites dogged British perseverance and energy with the Italian sense of the beautiful in art. A feeling of regret, however,

came over me, to think that our British school of dramatic representation and dramatic literature, which dawned brightly under Elizabeth, and in the eighteenth century was associated with everything distinguished in polite letters and polite society, should have become all but extinct. But this feeling was momentary, when I reflected that our sense of the beautiful, including the good and the true, had not diminished, but had merely gone into new channels; and, more especially, that Meyerbeer and Rossini, in order to hear their own incomparable works executed in perfection, must come to the city which the Exhibition of last year has indelibly stamped as the capital of the civilised world.

NUMBER TWELVE.

WHEN I was a young man, working at my trade as a mason, I met with a severe injury by falling from a scaffolding placed at a height of forty feet from the ground. There I remained, stunned and bleeding, on the rubbish, until my companions, by attempting to remove me, restored me to consciousness. I felt as if the ground on which I was lying formed a part of myself; that I could not be lifted from it without being torn asunder; and with the most piercing cries, I entreated my well-meaning assistants to leave me alone to die. They desisted for the moment, one running for the doctor, another for a litter, others surrounding me with pitying gaze; but amidst my increasing sense of suffering, the conviction began to dawn on my mind, that the injuries were not mortal; and so, by the time the doctor and the litter arrived, I resigned myself to their aid, and allowed myself, without further objection, to be carried to the hospital.

There I remained for more than three months, gradually recovering from my bodily injuries, but devoured with an impatience at my condition, and the slowness of my cure, which effectually retarded it. I felt all the restlessness and anxiety of a labourer suddenly thrown out of an employment difficult enough to procure, knowing there were scores of others ready to step into my place; that the job was going on; and that, ten chances to one, I should never set foot on that scaffolding again. The visiting surgeon vainly warned me against the indulgence of such passionate regrets—vainly inculcated the opposite feeling of gratitude demanded by my escape: all in vain. I tossed on my fevered bed, murmured at the slowness of his remedies, and might have thus rendered them altogether ineffectual, had not a sudden change been effected in my disposition by another, at first unwelcome, addition to our patients. He was placed in the same ward with me, and insensibly I found my impatience rebuked, my repinings hushed for very shame, in the presence of his meek resignation to far greater privations and sufferings. Fresh courage sprang from his example, and soon—thanks to my involuntary physician—I was in the fair road to recovery.

And he who had worked the charm, what was he? A poor, helpless old man, utterly deformed by suffering—his very name unnoticed, or at least never spoken in the place where he now was; he went only by the appellation of No. 12—the number of his bed, which was next to my own. This bed had already been his refuge during three long and trying illnesses, and had at last become a sort of property for the poor fellow, in the eyes of doctors, students, nurse-tenders, in fact, the whole hospital staff. Never did a gentler creature walk on God's earth: walk—alas! for him the world

was but an old memory. Many years before, he had totally lost the use of his legs; but, to use his own expression, 'this misfortune did not upset him.' he still retained the power of earning his livelihood, which he derived from copying deeds for a lawyer at so much per sheet; and if the legs were no longer a support, the hands worked at the stamped parchments as diligently as ever. But some months passed by, and then the paralysis attacked his right arm: still undaunted, he taught himself to write with the left; but hardly had the brave heart and hand conquered the difficulty, when the enemy crept on, and disabling this second ally, no more remained for him than to be conveyed once more, though this time as a last resource, to the hospital. There he had the gratification to find his former quarters vacant, and he took possession of his old familiar bed with a satisfaction that seemed to obliterate all regret at being obliged to occupy it again. His first grateful accents smote almost reproachfully on my ear: 'Misfortune must have its turn, but every day has a to-morrow.'

It was indeed a lesson to witness the gratitude of this excellent creature. The hospital, so dreary a sojourn to most of its inmates, was a scene of enjoyment to him: everything pleased him; and the poor fellow's admiration of even the most trifling conveniences, proved how severe must have been his privations. He never wearied of praising the neatness of the linen, the whiteness of the bread, the quality of the food; and my surprise gave place to the truest pity, when I learned that, for the last twenty years, this respectable old man could only afford himself, out of the profits of his persevering industry, the coarsest bread, diversified with white cheese or vegetable porridge; and yet, instead of reverting to his privations in the language of complaint, he converted them into a fund of gratitude, and made the generosity of the nation, which had provided such a retreat for the suffering poor, his continual theme. Nor did his thankful spirit confine itself to this. To listen to him, you would have believed him an especial object of divine as well as human benevolence—all things working for his good. The doctor used to say, that No. 12 had 'a mania for happiness;' but it was a mania that in creating esteem for its victim, infused fresh courage into all that came within its range.

I think I still see him seated on the side of his bed, with his little black silk cap, his spectacles, and the well-worn volume, which he never ceased perusing. Every morning, the first rays of the sun rested on his bed, always to him a fresh subject of rejoicing and thankfulness to God. To witness his gratitude, one might have supposed that the sun was rising for him alone.

I need hardly say, that he soon interested himself in my cure, and regularly made inquiry respecting its progress. He always found something cheering to say—something to inspire patience and hope, himself a living commentary on his words. When I looked at this poor motionless figure, those distorted limbs, and, crowning all, that smiling countenance, I had not courage to be angry, or even to complain. At each painful crisis, he would exclaim: 'One minute, and it will be over—relief will soon follow. Every day has its to-morrow.'

I had one good and true friend—a fellow-workman, who used sometimes to spare an hour to visit me, and he took great delight in cultivating an acquaintance with No. 12. As if attracted by a kindred spirit, he never passed his bed without pausing to offer his cordial salutation; and then he would whisper to me: 'He is a saint on earth; and not content with gaining Paradise himself, must win it for others also. Such people

should have monuments erected to them, known and read of all men. In observing such a character, we feel ashamed of our own happiness—we feel how comparatively little we deserve it. Is there anything I can do to prove my regard for this good, poor No. 12?'

'Just try among the bookstalls,' I replied, 'and find the second volume of that book you see him reading. It is now more than six years since he lost it, and ever since, he has been obliged to content himself with the first.'

Now, I must premise that my worthy friend had a perfect horror of literature, even in its simplest stages. He regarded the art of printing as a Satanic invention, filling men's brains with idleness and conceit; and as to writing—in his opinion,—a man was never thoroughly committed, until he had recorded his sentiments in black and white for the inspection of his neighbours. His own success in life, which had been tolerable—thanks to his industry and integrity—he attributed altogether to his ignorance of those dangerous arts; and now a cloud swept across his lately beaming face as he exclaimed: 'What! the good creature is a lover of books? Well, we must admit that even the best have their failings. No matter. Write down the name of this odd volume on a slip of paper and it shall go hard with me, but I give him that gratification.'

He did actually return the following week with a well-worn volume, which he presented in triumph to the old invalid. He looked somewhat surprised as he opened it; but our friend proceeding to explain that it was at my suggestion he had procured it in place of the lost one, the old grateful expression at once beamed up in the eyes of No. 12; and with a voice trembling with emotion, he thanked the hearty giver.

I had my misgivings, however; and the moment our visitor turned his back, I asked to see the book. My old neighbour reddened, stammered, and tried to change the conversation; but, forced behind his last intrenchments, he handed me the little volume. It was an old Royal Almanac. The bookseller, taking advantage of his customer's ignorance, had substituted it for the book he had demanded. I burst into an immoderate fit of laughter; but No. 12 checked me with the only impatient word I ever heard from his lips: 'Do you wish our friend to hear you? I would rather never recover the power of this lost arm, than deprive his kind heart of the pleasure of his gift. And what of it? Yesterday, I did not care a straw for an almanac; but in a little time it is perhaps the very book I should have desired. Every day has its to-morrow. Besides, I assure you it is a very improving study: even already I perceive the names of a crowd of princes never mentioned in history, and of whom up to this moment I have never heard any one speak.'

And so the old almanac was carefully preserved beside the volume of poetry it had been intended to match; and the old invalid never failed to be seen turning over the leaves whenever our friend happened to enter the room. As to him, he was quite proud of its success, and would say to me each time: 'It appears I have made him a famous present.' And thus the two guileless natures were content.

Towards the close of my sojourn in the hospital, the strength of poor No. 12 diminished rapidly. At first, he lost the slight powers of motion he had retained; then his speech became inarticulate; at last, no part obeyed his will except the eyes, which continued to smile on us still. But one morning, at last, it seemed to me as if his very glance had become dim. I arose hastily, and approaching his bed, inquired if he wished for a drink; he made a slight movement of his eyelids, as if to thank me, and at that instant the first ray of the rising sun shone in on his bed. Then the eyes lighted up, like a taper that flashes into brightness before it is extinguished—he looked as if saluting this

last gift of his Creator; and even as I watched him for a moment, his head fell gently on the side, his kindly heart ceased to beat. He had thrown off the burden of To-day; he had entered on his eternal To-morrow.

THINGS TALKED OF IN LONDON.

June 1882.

As usual, everything shews in this month that our season will soon be past its perihelion: soirées, whether scientific, exquisite, or political, take place almost too frequently for the comfort and wellbeing of the invited; and loungers and legislators are alike beginning to dream of leafy woods and babbling brooks. Our learned societies have brought their sessions to a close, with more or less of satisfaction to all concerned, the Royal having elected their annual instalment of new Fellows, and the Antiquaries having decided to reduce their yearly subscription from four guineas to two, with a view to an increase and multiplication of the number of their members, so that the study of antiquity may be promoted, and latent ability or enthusiasm called into play. The British Association are making preparations for their meeting at Belfast, and if report speak truth, the result of the gathering will be an advancement of science in more than one department. Concerts, musical gatherings, spectacles, are in full activity, the *entrepreneurs* seizing the moments, and coins too, as they fly. In short, midsummer has come, and fashion is about to substitute languor for excitement. Meantime, our excursion trains have commenced their trips to every point of the compass; and during the next few months, thousands will have the opportunity of exploring the finest scenery of our merry island at the smallest possible cost; and for one centre of attraction, as London was last year, there will now be a hundred.

The award of Lord Campbell on the bookselling question has given a great triumph to the innovating party, to which the authors to a man, and the great bulk of the public, had attached themselves. The *Trade*, as the booksellers call themselves, while admitting that they can no longer stand under a protective principle, feel certain difficulties as to their future career, for unquestionably there is something peculiar in their business, in as far as a nominal price for their wares is scarcely avoidable. If so, the question is, How is it to be adjusted? at a lower allowance for the retailer? In that case, some would still undersell others; and the old troubles would still be experienced. Ought there, then, to be no fixed retailing price at all, but simply one for the publisher to exact from the retailer, leaving him to sell at what profit he pleases or can get? In that case, the publisher's advertisement, holding forth no price to the public, would lose half its utility. Shall we, then, leave the retailer to advertise? All of these questions must occupy the attention of booksellers for some time to come, and their settlement cannot speedily be hoped for. The general belief, however, is, that the cost for the distribution of books from the shops of the publishers must be considerably reduced, the prices of books of course lowered, and their diffusion proportionately extended. It will perhaps be found that some of the greatest obstructions that operate in the case are not yet so much as touched upon.

The French have resumed their explorations and excavations at Khorsabad, and will doubtless bring to light many more remains of the arts of Nineveh; and Colonel Rawlinson has found the burial-place of the kings and queens of Assyria, where the bodies are placed in sarcophagi, in the very habiliments and ornaments in which they were three thousand years ago!

What an important relic it will be for our rejuvenated Society of Antiquaries to exercise their faculty of investigation upon! If discoveries go on at this rate, we shall soon want to enlarge our British Museum.

The Registrar-General tells us, in his first Report for the present year, that 90,936 persons were married in the last quarter of 1881—a greater number than in any quarter since 1842, except two, when it was slightly exceeded. It is altogether beyond the average, and confirms what has been before observed, that marriages are most numerous in England in the months of September, October, and November, after the harvest. To every 117 of the whole population there was one marriage. On the other hand, births are found to be most abundant in the first quarters of the year; the number for the first three months of the present year was 161,776. 'So many births,' says the Registrar, 'were never registered before in the same time.' In the same period of 1851, it was 157,874; and of 1848, 189,786. The deaths during the three months were 106,682, leaving an increase in the population of 55,094, which, however, disappears in the fact, that 57,874 emigrants left the United Kingdom in the course of the quarter. The mortality, on the whole, was less than in the ten previous winters, owing, perhaps, to the temperature having been 3° above the average; but the difference was more marked in rural districts than in the large towns. According to the meteorological table attached to the Report, it appears that the mean temperature for the three months ending in February was 41°·1, being 4°·2 above the average of eighty years. On the 10th of February, the north-east wind set in, and on seventy nights during the quarter the temperature went below freezing. The movement of the air through January and February was 160 miles per day—in March, 100 miles. Up to February 9, the wind was generally south-west, and rain fell on twenty-three days, and on six days only after that date. These periodical reports, and those of our Meteorological and Epidemiological Societies will doubtless, before long, furnish us with sufficient data for a true theory of cause and effect as regards disease, and for preventive measures.

Gold is, and will be for some time to come, a subject much talked about. Some of our financiers are beginning to be of opinion, that the period is not distant when a great change must be made in the value of our currency—the sovereign, for instance, to be reduced from 20s. to 10s. If so, there would be a good deal of loss and inconvenience during the transition; but, once made, the difficulty would cease. Others, however, consider that the demand for gold for manufacturing purposes and new appliances in the arts, will be so great, that not for many years to come will its increase have any effect on the value of the circulating medium. It will be curious if the result, as not unfrequently happens, should be such as to falsify both conclusions. Connected with this topic is the important one of emigration; and so important is it, that either by public or private enterprise, measures will be taken to insure a supply of labourers to the Australian colonies to replace, if possible, those who have betaken themselves to the diggings. Convicts will not be received; and as something must be done with them, Sir James Matheson has offered to give North Rona, one of the Orkney Islands, to the government for a penal settlement. It has been surveyed, and found to contain 270 acres, sufficient to support a population of 1000. Should the proposal be adopted, it will afford an opportunity for trying an entirely new system of discipline with the criminal outcasts.

Some attention has been drawn to the fact, that our 'Ten Hour Bill' has produced an effect on the other side of the Atlantic. The legislature of Ohio has just passed a 'ten hour law,' to apply to 'all manufacturers,

workshops, and other places used for mechanical or manufacturing purposes' throughout the state; the penalty to be a fine of from one guinea to ten. Something has already been said about extending its provisions to agricultural labourers and domestic servants—not so easy a task as the other; but when one remembers how desperately hard people are made to work in the United States, it is gratifying to observe ever so small a beginning towards more temperate and life-preserving regulations. In New York, great efforts are made towards establishing female schools of design and female medical colleges, with a view to open to women a wider sphere of employment than that to which they are now restricted. Notwithstanding the objections expressed in many quarters against female physicians, it is certain that they would find favour among a large class of invalids. Another Women's Rights Convention has been held, and an Industrial Congress. One of the questions discussed at the latter was: Why in the United States some have all the work and no property, and others all the property and no work? Harriet Martineau's stories of Political Economy would have helped the debaters to a satisfactory solution.

Our sanitary reformers, also, are felicitating themselves on the spread of their principles to the West, seeing that the first Baths for the People were opened in New York a few weeks since. It appears from accounts which have been sent over, that the edifice cost 80,000 dollars, and is provided with every convenience to insure the end in view—the promotion of cleanliness. The charge for plunge-baths is two cents; for warm-baths, five cents; and first-class baths, ten cents. For washing, a range of stalls extends through the building, in the bottom of which is a contrivance for admitting hot or cold water, as may be desired. The drying machinery is 'arranged after the plan of a window-sash, with weights and pulleys, so as to rise and fall at pleasure. This sliding apparatus, when elevated, is brought into contact with confined heated air for a few minutes, followed by a rapid draught of dry air, which dries the clothes with great rapidity. The same heat is made use of for heating the flat-irons, which are brought from the furnace to the hands of the laundresses on a miniature railway.' With such an establishment as this in full play, the 71,000 emigrants who landed in New York during the first four months of the present year, would have little difficulty in purifying themselves after their voyage.

There is yet another topic of interest from the United States—namely, the earthquake that was felt over a wide extent of country on the 29th of April last. Our geologists are expecting to derive from it some further illustration of the dynamics of earthquakes, as the Smithsonian Institution has addressed a circular to its numerous staff of meteorological observers, calling for information as to the number of shocks, their direction, duration, intensity, effects on the soil and on buildings, &c. There have been frequent earthquakes of late in different parts of the world, and inquiry may probably trace out the connection between them. The centre of intense action appears to have been at Hawaii, where Mauna Loa broke out with a tremendous eruption, throwing up a column of lava 500 feet high, which in its fall formed a molten river, in some places more than a mile wide. It burst forth at a point 10,000 feet above the base of the mountain.

Dr Gibbons has published a few noteworthy facts with respect to the climate of California, which shew that San Francisco 'possesses some peculiar features, differing from every other place on the coast.' The average yearly temperature is 54°; at Philadelphia it is 51° 50'; and the temperature is found to be remarkably uniform, presenting few of those extremes common to the Atlantic states. On the 28th of April last year, it was 84°; on October 19th, 83°; August 18th, 82°

—the only day in the three summer months when it rose above 79°. It was 80° on nine days only, six of them being in October; while in Philadelphia it is 80° from sixty to eighty days in the year. In the latter city, the temperature falls below the freezing-point on 100 days in the year, but at San Francisco on twenty-five mornings only. The coldest month is January; the hottest, October. 'In the summer months, there is scarcely any change of temperature in the night. The early morning is sometimes clear, sometimes cloudy, and always calm. A few hours after sunrise, the clouds break away, and the sun shines forth cheerfully and delightfully. Towards noon, or most frequently about one o'clock, the sea-breeze sets in, and the weather is completely changed. From 60° or 65°, the mercury drops forthwith to near 50° long before sunset, and remains almost motionless till next morning.' The summer, far from being the beautiful season it is in other countries, parches up the land, and gives it the aspect of a desert, while the 'cold sea-winds defy the almost vertical sun, and call for flannels and overcoats.' In November and December, or about midwinter, the early rains fall, and the soil becomes covered with herbage and flowers. These are facts which emigrants bound for California will do well to bear in mind.

To come back to Europe. M. Fourcault has addressed a communication to the Académie on 'Remedies against the Physical and Moral Degeneration of the Human Species,' intended more especially for the working-classes. He would have schools of gymnastics and swimming established along the great rivers, and on the sea-shore; gymnastic dispensaries, and clinical gymnastic in towns; and agricultural and other hospitals, combining simple and economical means of water-cure. His clinical gymnastic comprehends three divisions: hygienic or muscular exercise, not violent or long-continued, or productive of perspiration; medical, in which the exercise is to be kept up until perspiration is induced; and orthopedic, which, by means of ropes, bands, and loops attached to a bed, enable the patient to take such straining and stretching exercise as may be likely to rectify any deformity of limb. Whichever method be adopted, it must be carried out conscientiously, because 'feeble muscular contractions, without energy or sustained effort, produce no hygienic, medical, or orthopedic effect.' M. Fourcault may perhaps find some of his objects accomplished in another way, for the Prince President has, by a decree, appropriated 10,000,000 francs to the improvement of dwellings for the working-classes—3,000,000 of the sum being set apart for Paris—and has offered 5000 francs for the best design. If such works as these continue, we shall soon cease to hear that enough is not done for the working-classes; and they will have, in turn, to shew how much they can do for themselves.

A portable electric telegraph has lately been introduced on some of the French railways, by which, in case of accident, the conductors may communicate with the nearest stations. It is all contained in a single box, the lower portion of which contains the battery, the upper, the manipulator and signal apparatus. When required to be used, one of the wires is hooked on to the wires of the telegraph, and the other attached to an iron wedge thrust into the earth. It answers so well, that the directors of the Orleans line have provided thirty of their trains with the portable instruments. In connection with this, I may tell you that Lamont of Munich, after patient inquiry, has come to the conclusion, that there is a decennial period in the variations of the magnetic declination; it increases regularly for five years, and decreases as regularly through another five. If it can be discovered that the horizontal intensity is similarly affected in a similar period, another of the laws of terrestrial magnetism will be added to the sum of our knowledge.

NATIVITY AND PARENTAGE OF MARSHAL MACDONALD, DUKE OF TARENTUM.

M. de Lamartine having made a mistake in his *History of the Restoration*, in describing Marshal Macdonald as of Irish extraction, it may be worth while to state what really was the parentage of that highly respectable man.

When Prince Charles Stuart had to voyage in an open boat from the isle of South Uist in the Hebrides to Skye, he was guided and protected, as is well known, by Miss Flora Macdonald. On that occasion, Flora had for her attendant a man called Neil Macdonald, but more familiarly Neil Macechan, who is described in the *History of the Rebellion* as a 'sort of preceptor in the Clanranald family.' This was the father of Marshal Macdonald. He remained more or less attached to the fugitive prince during the remainder of his wanderings in the Highlands, and afterwards joined him in France, under the influence of an unconquerable affection for his person. It was thus that his son came to be born abroad.

Neil Macdonald, though a man of humble rank, had received the education proper for a priest at the Scots College in Paris. His acquaintance with the French language had enabled him to be of considerable service to Prince Charles, when he wished to converse about matters of importance without taking the other people about him into his confidence. There is some reason to believe, that he wrote, or at least gave the information required for, a small novel descriptive of the poor Chevalier's wanderings, entitled *Ascanius, or the Young Adventurer*. (Cooper, London, 1746.)

When Marshal Macdonald visited Scotland in 1825, he made his way to the farm of Howbeg, in South Uist, where his father had been born, and where his ancestors had lived for many generations. He found here an old lady and her brother, his cousins at one remove, to whom he shewed great kindness, settling a pension at the same time upon a more distant relation whom he found in poverty. When about to leave the spot, he took up some of the soil, and also a few pebbles, which he got packed up in separate parcels, and carried back with him to France.

The facts respecting Marshal Macdonald's parentage were lately communicated to M. de Lamartine, who promptly sent the following answer: 'J'ai reçu, avec reconnaissance, monsieur, vos intéressantes communications sur le Maréchal Macdonald, homme qui honore deux pays. J'en ferai usage l'année prochaine à l'époque des nouvelles éditions.'

DOMESTICATION OF WILD BEES.

The following account of the process of transplanting bodily a tribe of wild bees, is given in the notes to *The Tay*, a descriptive poem of considerable merit by David Millar. (Perth, Richardson, 1850.) 'When the boy, whose hobby leads him in that direction, has found out a "byke," he marks the spot well, and returns in the evening, when all its inmates are housed for the night. Pushing a twig into the hole as far as it will go, in case he should lose it by the falling in of the rubbish, he commences digging freely till the hum of the hive is distinctly heard, when he proceeds more cautiously to work. By this time, the more adventurous of the bees come out to ascertain what is

going on, and are caught as they make their appearance, and put into a bottle. When the nest is fully exposed, it is lifted carefully up, and placed, as it stood, in a box prepared for it, along with the captured bees. The lid being now closed, the whole is carried home, and placed in the spot assigned for it in the garden. Next morning, a hole in the side of the box is quietly opened, when one or two of the strangers soon make their appearance, wondering, evidently, where they are, but apparently resolved to make the most of their new circumstances. At last, they rise slowly on the wing, and buzz round and round their new habitation for some time, taking, no doubt, special note of its every peculiarity. The circle of observation is then gradually enlarged, till it is thirty or forty yards in circumference, when the earnest reconnoitrer disappears, to return again in a short time with something for the general good. The curious in those matters, by placing the grubs of all the different kinds in one box beside a hive in operation, will soon have a choice assortment of all descriptions, working as amicably together as if they were all of the same family.'

COPPER-PLATE ENGRAVINGS COPIED ON STONE.

In No. 439 of this Journal, Lieutenant Hunt received the credit of inventing a process by which copper-plate engravings may be transferred to stone, and the copies from a single print thus multiplied indefinitely. A correspondent, however, makes us fear that Lieutenant Hunt may have been unacquainted with what others had done before him. The process, it is stated, is not at all new; although, so far as we have heard, it has never been applied to the transfer of complicated pictorial engravings.

SONNET:

ON MY LITTLE BOY'S FIRST TRYING TO SAY 'PA-PA.'

MARKED day! on which the earliest dawn of speech
Glimmered, in trial of thy father's name!
Albeit the sound imperfect, yet the aim
Thrilled chords within me, deeper than the reach
Of music! Happy hearted, I did claim
The title which those silver tones assigned;
And in me leaped my spirit, as when first
The father's strange and wondering feeling came!
While this dear thought woke up within my mind,
Which careful memory in her folds has nursed:
'If thus to earthly parent's heart so dear
His child's first accents, though imperfect all—
Dear, too, to FATHER-GOD, when faint doth fall
His new-born's half-formed "Abba" on his ear!'

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 444. NEW SERIES.

SATURDAY, JULY 3, 1852.

PRICE 1½d.

THE ART SEASON.

RETURNING with the circling year, and advancing *pari passu* with the multitude of metropolitan musical attractions, comes the more silent reign of the picture exhibitions—those great art-gatherings from thousands of studios, to undergo the ultimate test of public judgment in the dozen well-filled galleries, which the dilettante, or lounging Londoner, considers it his recurring annual duty strictly to inspect, and regularly to gossip in. As places where everybody meets everybody, and where lazy hours can be conveniently lounged away, the exhibitions in some sort supply in the afternoon what the Opera and parties do in the evenings. Nearly all through the summer-day, they are crowded with a softly-rustling, humming, buzzing crowd, coming and going perhaps, taking little heed of the nominal attraction, but sauntering from room to room, or ensconcing themselves in colonies or clusters of chairs, and lounging vacantly in cool lobbies. At energetic sight-seers, who are labouring away, catalogue and pencil in hand, they stare languidly. They really thought everybody had seen the pictures; they know they have: they have stared at them until they became a bore. But this sort of people, who only come once, why, of course, they suppose this sort of people must be allowed to push about as they please. But it is a confounded nuisance; it is really.

The great army of art amateurs, connoisseurs, and the body who are regarded in the artistic world with far greater reverence—the noted picture buyers and dealers, have come and seen, and gone away again; after having lavishly expended their approbation or disapprobation, and possibly in a less liberal degree, their cash. After the first week or so, the galleries begin to clear of gentlemen of the class in question; even artists have got tired of coming to see their own pictures, particularly if they be not well hung; and so the exhibition is generally handed over during the greater part of its duration to the languid *far niente* elegant crowd we have seen thronging its corridors. The grand day for the moneyed amateurs, who come to increase their collections, is, however, that of the private view. This generally occurs on a Saturday, and the public is admitted on the following Monday. Within an hour of the opening on the former day, the rooms are crowded with a multitude of notabilities. You see that you are in a special class of society, or rather, in two special classes—literary and artistic on the one hand; wealthy and socially elevated on the other. The fact is evident in the general mutual acquaintanceship which prevails, principally within each respective circle, but by no means exclusively so. First, you are sure to observe a

cluster of those peers and members of parliament who busy themselves most in social, literary, and artistic questions. Bishops, too, are regular private-view men; capital judges, moreover, and liberal buyers; and we seldom miss catching a glimpse of some dozen faces, whose proprietors are men standing at the very top of our historic, philosophic, and critical literature, and who move smilingly about, amid the keen but concealed inspection of the crowd, who pass their names in whispers from group to group.

But the class of regular picture-buyers is quite *sui generis*. You may pitch upon your man in a moment. Ten to one, he is old, and has all the shrivelled, high-dried appearance of the most far-gone and confirmed bachelorism. Everything about him looks old and old-fashioned. His hair is thin and gray, and he shuffles along on a couple of poor old shanks, which will never look any stouter unless it be under the influence of a fit of the gout. He wears a white neck-cloth, arranged with the celebrated wisp-tie—shoes a great deal too big for him—and to his keen, twinkling eyes he applies a pair of heavy horn or silver-set glasses. These old gentlemen appear to know each other as if by magic. They cluster in groups like corks in a basin of water, and then go hobbling eagerly along, peering closely into the more promising works, jerking their heads from side to side, so as to get the painting in as many lights as possible; and full of talk—good critical talk—about the productions in course of inspection. True, there may be something in their observations speaking too much of the technical, and too little of the more ideal faculty. They are greater upon flesh-tints and pearly grays, middle distances and chiaro-scuro, than upon conception, expression, or elevation or magnificence of sentiment. Nevertheless, they know thoroughly what appertains to a good picture. They give a work its place in a moment, and assign it to its author by internal evidence, with an unflinching accuracy, which speaks of long training and constant familiarity with all the main studios of London. Perhaps you observe one of our friends apparently fascinated before a particular canvas: he dances about, so as to get it in every angle of light. Then he shuffles off, and brings two other skilful old foggies, holding each by an arm; and the three go through the former ceremony as to the lights, and then lay their heads together; and then our original personage glides softly up to the table where the secretary's clerk sits with pen and ink before him, and whispers. The clerk smiles affably—turns up a register: there are two or three confidential words interchanged; and then he rises and sticks into the frame of the lucky picture a morsel of card, labelled 'Sold;' and leaves the purchaser gloating over his acquisition.

And where do these pictures go? Frequently to some quiet, solemn old house in the West End, or to some grange or manor far down in the country. The picture-gallery is the nursery of that house—its pride and its boast. Year after year has the silent family of canvases been increasing and multiplying. Their proprietor is, as it were, their father. He has most likely no living ties, and all his thoughts and all his ambitions are clustered round that silent gallery, where the light comes streaming down from high and half-closed windows. The collection gradually acquires a name. Descriptions of it are found in guide-books and works upon art. Strangers come to see it with tickets, and a solemn housekeeper shews them up the silent stairs, and through the lonesome mansion to its *sanctum sanctorum*. At length, perhaps, the old man takes his last look at his pictures, and then shuts his eyes for ever. It may be, that within six weeks the laboriously collected paintings are in a Pall-Mall auction-room, with all the world bidding and buzzing round the pulpit; or it may also chance that a paragraph goes the round of the papers, intimating that his celebrated and unrivalled collection of modern works of art has been bequeathed by the late Mr So-and-so to the nation—always on the condition, that it provides some fitting place for their preservation. The government receives bequests of this kind oftener than it complies with the stipulation.

In the beginning of March, the first of the galleries opens its portals to the world. This is the British Institution, established at the west end of Pall-Mall, and now in existence for the better part of a half century. The idea of the establishment was to form a sort of nursing institution for the Royal Academy. Here artists of standing and reputation were to exhibit their sketches and less important works; and here more juvenile aspirants were to try their wings before being subjected to the more severe ordeal of Trafalgar Square. The idea was good, and flourished apace; so much so, that you not unfrequently find in the British Institution no small proportion of works of a calibre hardly below the average of the Great Exhibition; while the A. R. A.'s, and even the aristocratic R. A.'s* themselves, do not by any means disdain to grace the humble walls of the three rooms in Pall-Mall. This year, the only picture of Sir Edwin Landseer's exhibited—a wild Highland corry, with a startled herd of red deer—is to be found in the British Institution. But the merit of the works is wonderfully unequal. They are of all classes and all sizes, in water-colour and in oils. Clever sketches by clever unknowns, rest beside sprawling frescos by youths whose ambition is vaster than their genius; and finished and accomplished works of art are set off by the foils of unnumbered pieces of unformed and not very promising mediocrity. Among them are the productions of many of the more humble painters of *genre* subjects—the class who delight in portraying homely cottage interiors, or troops of playing children, or bits of minutely-finished still life—or careful academical studies of groups with all the conventions duly observed: this class of pictures musters strong, and connoisseurs, without so much remarking their imperfections, carefully note their promise.

A month after the opening of the British Institution, three galleries become patent on the same morning: the Old Water Colour, in Pall-Mall East, the New Water Colour, in Pall-Mall West, and a still more recently founded society, called, somewhat pompously, the National Institution of Fine Arts. These are mainly composed of dissenters from the other associations—gentlemen who conceive that they have been ill-treated by Hanging Committees, and a large class of juvenile but promising artists, who resort to the less crowded institutions in the hope of there meeting with better

places for their works than in the older and more established bodies. The two water-colour galleries are both highly favoured exhibitions, and present works of an importance quite equal to those of the Academy itself. Water-colour painting is indeed a national branch of art in England. Neither French, Germans, nor Italians, can presume for a moment to cope with us in the matter of *aquarelles*. They have no notion of the power of the medium, of the strong and rich effects it is capable of producing, and the transparency of the tints which a great water-colour artist can lay on. Nearly twenty years ago, there was but one water-colour society; but increasing numbers, and the usual artistic feuds, produced a partly natural, partly hostile, separation. The ladies and gentlemen who withdrew were mainly figure painters; those who stayed were mainly landscape artists; and thus it happens, that while in the new society you are principally attracted by historic and *genre* groups and scenes, in the old you are fascinated by landscape and city pictures of the very highest order of art. The painters, too, you observe, are very industrious. The fact is, they can work more quickly in water than in oil. Copley Fielding will perhaps exhibit a score of landscapes, blazing with summer sunshine; David Cox, half as many—stern and rugged in tone and style; George Tripp will have painted his fresh river and meadow scenes by the dozen; and the two brothers Callum will each have poured in old Gothic streets and squares, and ships in calm and storm, which catch your eye scores of times upon the walls. As in the other society, many of the finest 'bits' contributed by the water-colourists are not much above miniature size. The screens on which these gems are hung attract fully as much as the walls with their more ambitious freight; and Jenkin's rustic lassies, and Topham's Irish groups, and Alfred Fripp's dark-eyed Italian monks and Campagna peasants, are as much gazed at as Richardson's sunny landscapes or Bentley's breezy seas.

Five minutes' walk takes us to the new society. No lack of landscape here; but it is inferior to that in the rival institution, and its attractions are eclipsed by ambitious pictures of historic or fictitious interest; the scene almost always laid in the picturesque streets or rooms of a mediæval city, and the groups marvel of display in the matter of the painting of armour, arms, and the gorgeous velvets, minivers, and brocades of fædal *grande tenue*. See Mr Edward Corbould. He is sure to be as picturesque and chivalrous as possible. There is the very ring of the rough old times in his caroling processions of ladies and knights, or his fierce scenes of hand-to-hand fight, with battered armour, and flashing weapons, and wounded men drooping from their steeds. Or he paints softer scenes—passages of silken dalliance and love; ladies' bowers and courtly revels in alcoved gardens. Mr Haghe is equally mediæval, but more sternly and gloomily so. He delights in sombre, old Flemish rooms, with dim lights streaming through narrow Gothic windows, upon huge chimney-pieces and panellings, incrustated with antique figures, carved in the black heart of oak—knights, and squires, and priests of old. Then he peoples these shadowy chambers with crowds of stern burghers, or grave ecclesiastics, or soldiers 'armed complete in mail,' and so forms striking pieces of gloomy picturesqueness. Figure-paintings of a lighter calibre also abound. There is Mr John Absolon, who is in great request for painting figures in panoramic pictures; Mr Lea, whose graceful rural maidens are not to be surpassed; Mr Warren, whose heart is ever in the East; and Mr Mole, who loves the shielings of the Highland hills. Landscape, though on the whole subordinate to *genre* pictures, is very respectably represented; and the lady-artists usually make a good show on the screens, particularly in the way of graceful single figures, and the prettinesses of flower and fruit painting.

* Associates Royal Academy, and Royal Academicians.

We can merely mention the Society of British Artists and the National Institution of Fine Art. Both are mainly composed of the natural overgrowth of artists who prefer a speedy and favourable opportunity for the display of their works in minor galleries, to waiting for years and years ere they can work themselves up to good positions on the walls of the Academy. Many of these gentlemen, however, exhibit both in the smaller and the greater collection; but here and there an artist will be found obstinately confining his contributions to one pet establishment—possibly entertaining a notion that he has been deeply wronged by the Hanging Committee of another.

Both of the exhibitions under notice are very various in merit; but each generally contains some able works, and the specialties of one or two painters distinguished by notable peculiarities. Thus the president of the British Artists, Mr Hurlstone, has for several seasons confined himself to Spanish subjects; Mr West paints Norwegian landscape; Mr Pyne sends to this gallery only his very splendid lake-pictures; and Mr Woolmer's curious sketches, which seem compounded of the styles of Turner and Watteau, blaze almost exclusively upon the walls. The best men of the National Institution contribute also to the Royal Academy—as, for example, Mr Glass, with his capital groups of hunters or troopers, so full of life and movement; and Mr Parker, with his smugglers and coast-boatmen. In this exhibition—and, indeed, in all the London exhibitions—a family, or rather a race or clan of artists, connected at once by blood and style, and rejoicing in the name of Williams, abound and flourish exceedingly. These Williamses are dreadful puzzlers to the students of the catalogue; they positively swarm upon every page, and the bewildered reader is speedily lost in a perfect chaos of undistinguishable initials. Sometimes, indeed, the Williamses come forth under other appellations—they appear as Percies and Gilberts; but the distinguishing mark is strong, and a moment's inspection convinces the amateur that the landscape before him, attributed to Mr So-and-so, is the work of 'another of these everlasting Williamses.'

But the first Saturday of May arrives, and with it many a rumour, true and false, of the state of matters within the Royal Academy—of the academicians who exhibit, and of what are to be 'the' pictures. From early morning, St Martin's bells have been ringing, and a festival flag flies from the steeple; no great pomp, to be sure, but it marks the occasion. About noon, the Queen's party arrives, and Her Majesty is conducted about the rooms by the leading members of the Academy. Between one and two, she departs; and immediately after, the crowd of ticket-holders for the private view cluster before the closed gratings. Punctually as the last stroke of the hour strikes, the portals are flung open, and a cataract of eager amateurs rush up the staircases, and make their way straight to the inner room, or room of honour, all in quest of the picture, to which the *pas* has been given, by its being hung upon the line in the centre of the eastern wall of the apartment. The salons fill as by magic; in half an hour, you can hardly move through a crowd of dignitaries of all kinds—hereditary, social, literary, scientific, and artistic. Perhaps, indeed, there is no muster in London which collects a greater number of personages famous in every point of view. The ladies of the aristocracy swarm as at a drawing-room. The atmosphere is all one rustle of laces and silks; and it is anything but easy to make one's way among the beves of clustered beauties who flock round their chaperone, all one flutter of ribbons, feathers, and flowers. And to the Academy, at all events, come all manner of political notabilities: you find a secretary of state by your elbow, and catch the muttered criticism of a prime-minister. Ordinary peers and members of parliament are thicker than

blackberries. Bishops prevail as usual; and apropos of ecclesiastical costumes, peculiar looped-up beavers and single-breasted greatcoats, the odds are, that you will be attracted by the portly figure and not very refined face of the Romish dignitary whose pretensions, a couple of years ago, set the country in a blaze. The muster of literary men is large and brilliant. Mr Hallam is most likely there as Professor of Ancient History to the Academy; and Mr Macaulay as Professor of Ancient Literature. Sir George Staunton puts in an appearance as Secretary for Foreign Correspondence; and blooming Sir Robert Harry Inglis, with the largest of roses at his button-hole, looks the most genial and good-humoured of 'antiquaries.' The Academicians—lucky Forty!—muster early. Happy fellows! they have no qualms of doubt, or sick-agonies of expectation as they mount the broad flight of steps. They have been giving hints to the Hanging Committee, or they have been on the Hanging Committee themselves. Well they know that *their* works have been at least provided for—all on the line, or near it; all in the best lights; and all titivated and polished up and varnished on the walls, and adapted, as it were, to the situation. You may know an R.A. on the private view-day by the broad, expanding jollity of his visage, if he be a man of that stamp, or by a certain quiet, self-satisfied smile of self-complacency, if he be a man of another.

But he looks and bears himself as a host. He cicerones delighted parties of lady-friends with his face all one smile of courtesy, or he does the honours with dignity and a lofty sense of—we do not speak disrespectfully—of being on his own dunghill, in respect to the more important exigent connoisseurs, whom he thinks it right to patronise. He always praises his brethren's works, and discovers in them hidden virtues. For the Associates, he has minor smiles and milder words. The ordinary mob of exhibitors he looks down upon with a calm and complacent gaze, as though from the summit of a Mont Blanc of superiority. At any bold defier of the conventions and traditions of the Academy drawing-school, he shakes his head. The pre-Raphaelite heresy was a sore affliction to him. He looked upon Millais and Hunt as a Low-church bishop would regard Newman and Pusey. He prophesied that they would come to no good. He called them 'silly boys;' and he looks uneasily at the crowds who throng before this year's picture of the Huguenot Couple—not recovering his self-complacency until his eye catches his own favourite work, when he feels himself gradually mollified, and smiles anew upon the world.

Not so the nameless artist, whose work of many toiling days, and many sleepless nights, has been sent in unprotected to take its chance. He knows nothing of its fate until he can get a catalogue. It may be on the line in the east room; it may be above the octagon-room door; it may not be hung at all. Only the great artistic guns are invited to the private view, the rest must wait till Monday. Possibly a stray catalogue puts him so far out of his pain on Sunday. If not, he passes a feverish and unhappy time till the afternoon of Monday; and then, first among the crowd, rushes frantically up stairs. We had an opportunity the other day of seeing the result of a case of the kind. The picture—a work of great fancy and high feeling, but deficient in manipulative skill—the artist, a poet in the true sense of the word, had spent months in dreaming and in joying over. He found it in the dingiest corner of the octagon-room. His lip quivered and his chest heaved. He pulled his hat further down on his face, and walked quickly and quietly out.

We would gladly, indeed, see the octagon-room abolished. A picture is degraded, and an artist is insulted, by a painting being hung in this darksome and 'condemned cell.' The canvas gets a 'jail-bird' stamp, and its character is gone. In France, at the Palais-Royal,

the young artists have a far better chance. After a stated time, the pictures, which, as the best have primarily had the best places, change stations with their inferiors; so that everybody in turn enjoys the advantages of the brightest lights and the most favourable points of view.

No need, of course, of attempting even the most summary sketch of the styles and ordinary subjects of the great painters who bear aloft the banner of the British school of art—of Landseer's glimpses of the Highlands; or Stanfield's skye, breezy landscapes; of the quiet pieces of English rural scenery—meadows, and woodland glades, and river bits, fresh and rich, and green and natural—of our Lees, our Creswicks, our Coopers, our Witheringtons, our Redgraves, our Auddills; of the classic elegance and elevated sentiment of groups by our Dyces and our Eastlakes; of the abundance of clever *genre* subjects—scenes from history or romance—poured in by our Wards, our Friths, our Pooles, our Elmores, our Eggs; or of—last, not least—the strange but clever vagaries of that new school, the pre-Raphaelites, who are startling both Academy and public by the quaintness of their art-theories, and the vehement intensity of their style of execution. All the summer long, the world is free to go and gaze upon them. All the summer long, the salons are crowded from morning till night—in the earlier hours, by artists and conscientious amateurs, the humbler sort of folks, who have daily work to do; in the later, by our old friends, the staring, *insouciant*, lounging, fashionable mob, whose carriages and Broughams go creeping lazily round and round Trafalgar Square. And at parties and balls, and all such reunions, the exhibition forms a main topic of discourse. Bashful gentlemen know it for a blessing. Often and often does it serve as a most creditable lever to break the ice with. The newspapers long resound with critical columns apropos of Trafalgar Square. You see 'sixth notice' attached to a formidable mass of print, and read on, or pass on, as you please. But you distinctly observe, at any rate, the social and conversational, as well as the artistic importance of the Royal Academy; and you confess, that a London season would be shorn of its brightest feature if you shut the gates of the National Gallery.

A. B. R.

BILL WILLIAMS:

A STORY OF CALIFORNIA.

It was in the first flush of the Californian fever, when moderate people talked of making one's fortune in a fortnight, and the more sanguine believed that golden pokers would soon become rather common, that the *Betsy Jones* from London to New Zealand, with myself on board as a passenger, dropped anchor in the bay of San Francisco, and master and man turned out for the diggings. It is my impression that not a soul remained on board but the surgeon, who was sick, and the negro cook, who wouldn't leave him; and the first man I met on the deck of the *Go-Ahead* steamer, which took us up to Sacramento, was our enterprising captain, clad in a canvas jacket and trousers, with the gold-washing apparatus, two shirts, and a tin kettle, slung at his back. The crew followed his example, and all the passengers. The latter were some thirty men, from every corner of Britain, and of various birth and breeding. There were industrious farm-servants and spendthrift sons of gentlemen among them. Some had sailed with money, to purchase land in the southern colony, some were provided only with their hopes and sineys; but California was an irresistible temptation to them all, and by general desire, they had come to try their

luck at the washing. We had mere boys and men of grizzling hair in our company. Two were married, but they wisely left their wives in San Francisco, where, having brought with them some spare blankets and crockery, the ladies improvised a boarding-house, and I believe realised more than their wandering lords. Nevertheless, we, one and all, went up the broad river with loftier expectations than the prudent among us cared to make public.

There was one who made no secret of his hopes. The man's name was Bill Williams. I had had a loose acquaintance with Bill from school-time, for we had been brought up in the same good town of Manchester, where his father was a respectable tradesman, and his three brothers were still in business. Many a town and many a trade had Bill tried to little purpose. Never doing what his relatives could call well, he had gone through a series of failures, which tired out both kinsmen and creditors, and at length shipped for New Zealand, leaving a wife and seven children to the care of the said three brothers, till he should see how the climate agreed with him, and find a home for them. Bill did not belong to the extended fraternity of scapegraces. He was neither wild nor worthless, in the ordinary sense of those terms, but there was a faith in him, the origin of which baffled his most penetrating friends, that he was to get money somehow without working for it by any of the common methods. Unlike many a professor of better principles, Bill had carried that faith into practice. Under its influence, he had engaged in every scheme for making fortunes with incredible rapidity which coffee-house acquaintances or advertising sheets brought to his knowledge. There was not a banking bubble by which he had not lost, nor a mining company of vast promise and brief existence in which he had not held shares. Uncompromisingly averse to the jog-trot work of ordinary mortals, Bill was neither indolent nor timid in his own peculiar fashion of seeking riches. He would have gone up in a balloon to any height, or down in a diving-bell to depths yet unsounded, had the promise been large enough; and there was something so suitable to his inclinations in the Californian reports, that he was the prime mover of our visit to San Francisco, and the entire desertion of the ship. Strange to say, every man on board believed in Bill; from the captain to the cabin-boy, they had all listened to his tales. Where he had learned such a number, fortune knows, concerning found treasures, and wealth suddenly obtained by unexpected and rather impracticable ways. That was the whole circle of Bill's literature, and going over it appeared his chief joy; but the gem of the collection was a prophecy which a gipsy woman, whom his mother met once in a country excursion, had uttered concerning himself—that he should find riches he never wrought for, and leave a great fortune behind him. In the faith of that prediction Bill had lived; and it was a curious illustration of the sympathetic force inherent in a firm belief, that both passengers and seamen, even those who affected to laugh at the rest of what they called his wonderful yarns, entertained a secret conviction in favour of that tale, and felt secure of gold-gathering in Bill's company.

I am not certain that my own mind was entirely clear of a similar impression, but the two among us who contended loudest and believed most devoutly, were the captain and his mate. They were brothers, and of Jewish parentage; the rest of the family still hang about an old-clothes and dyeing establishment

in the neighbourhood of Houndsditch. I made that discovery by an accidental glance at a torn and mislaid letter before we left the Thames, and thought proper to reserve it for private meditation. The relationship of the two was kept a profound secret, for reasons best known to themselves; but to the eye at least it was revealed by their striking resemblance, both being small, spare, dingy-complexioned men, with keen, cunning eyes, and faces that looked as hard and sharp as steel. Ever since they first heard of the prophecy, they had half ridiculed, half flattered, and kept remarkably familiar with Bill. That familiarity rather increased as we went up the Sacramento. A goodly number we made on the deck of the *Go-Ahead*, our only place of accommodation; and at length we reached the new town, the golden city, which takes its name from the river, christened in old times of Spanish voyaging by some discoverer for his Catholic majesty, and which was to be the metropolis of the diggings. When I first saw it, it consisted of some hundred huts and tents, a large frame-house, in which an advertising board informed us there was an ordinary, a gaming-table, and all manner of spirits; and a timber wharf, somewhat temporarily put together, at which we landed. Yet the city was rising, as cities rise only in the western hemisphere: broad streets and squares were marked out; building was going forward on all sides; while bullock-wagons, canoes, and steamers, brought materials by land and water. The enterprise and vagrancy of all nations were there, as we had seen them at San Francisco; and those not engaged in building the town, were going off in caravans to the gold-gathering.

We fraternised with a company of Americans, who said they knew 'a bluff that flogged creation for the real metal,' and sold us two spare tents and a wagon, at a price marvellous to ask or pay. Our journey was not far. It led along the course of the Sacramento, and towards evening we came in sight of the diggings. A strange sight it was for one accustomed to London streets and shops. The Sacramento runs through a great inclined plane, sloping from the hill-country to the sea. Here and there, it is covered with low coppice or underwood; but the greater part is bare and sandy, or sprinkled over with thin, dry waving grass. As far as the eye could reach upon the plain, and up the river-banks, the smoke of fires was rising from hut, tent, and upturned wagon, which served for temporary dwellings. Groups of men were hard at work in small trenches, and numbers more stood with pan and cradle, washing out the gold in the shallow creeks of the river. 'Our location,' as the Americans called it, was an earthy promontory jutting far out into the water. Close by its landward base we pitched our tents, turned up our wagon—the bullocks that brought it belonged to the Americans, who promised to sell us a share when they were killed—and commenced operations. Digging out tenacious clay, and washing its sandy particles for minute grains of gold, sleeping under canvas at night, and living on half-cooked and not very choice provisions, have little in them of interest worth relating. The first thing that struck me, was the silence that prevailed among the workers. In a district so populous, scarcely a sound was heard from tent, trench, or river. Caravan after caravan, as it arrived, pitched its tents, and fell to work in the same quiet fashion. A cynical character might have attributed this to the absence of all feminine faces, for in my time there was not a woman at the diggings. Incredible as it may seem to the fair ones themselves, they were not missed; but nobody missed anything except gold. Relations parted; old comrades left each other with scarcely a leave-taking in search of better gatherings; our American friends began to get tired of the bluff that flogged creation; for although we were getting gold, it was but little, and the more impatient spirits of our company departed with them to find another.

I wondered that Bill did not join their company. He was long ago weary of gold-washing; the work was too regular, and the returns far too slow for him. He used to declare that shopkeeping was better; and it is probable that most of us had similar convictions regarding the vocations we had left in Britain; but except occasionally cooking for the rest, smoking the tobacco he had providently brought with him, and suggesting wild projects of digging down the bluff, and dredging the river for lumps of gold, which, he said, all the grains we found came off, Bill at last did nothing at all. With hard labour and harder fare, we had collected some of us more and some less of the precious dust; but nobody's fortune was yet made, and the rainy season set in.

The heavy rains confined us for days to the shelter of tent and wagon; but the days were nothing to the nights, which on the banks of the Sacramento are almost equinoctial throughout the year; and we had neither coal nor candle. All the fuel that could be found was rather too little for culinary purposes. Concerning the rest of our comforts, there is no use in being particular; but at intervals between the drowning showers, we were willing enough to come out and work, though the muddy soil and the swollen river made our labour still harder, and our profits less. The best service was done us by an honest Paisley weaver, who had left his helpmate and two children at San Francisco, in hopes of taking back, quite full, a strong chest, of some two hundredweight capacity, which he had brought with infinite pains to the diggings. He enlivened our wet leisure by repeating whole volumes of Burns and Scott. Bill also returned to his wonderful stories, though the captain and mate sneered at them more than ever; indeed, they were by far the most discontented of the company, and an unaccountable sort of distrust seemed growing between them and Bill. At length, fever and ague began to thin the ranks of the gold-seekers; we saw the working-parties around us diminish day by day, and graves dug in the shadows of the low coppice. Our company kept up amazingly, perhaps because, according to the captain's counsel, we held but little communication with other workers; but the want of the buffalo-meat, which the Indian traders were accustomed to bring, was much felt among us; and one day less rainy than usual, Bill Williams, as the idlest, was sent up the river's bank, on their wonted track, to look out for their coming. The rest were busy, and did not miss him; but I thought he stayed long. The sky became unusually dark; great clouds floated over us from the west, and then broke with a sudden thunder-crash, which was renewed every five minutes with such rain and lightning as I had never seen. We ran to our tents, and, when fairly sheltered, Bill also arrived, wet to the skin, out of breath, and looking terribly frightened. He said, hastily, that he had seen nothing, and no word of the Indians; but the poor fellow began to shiver as he spoke, and before evening the fever was strong upon him.

To keep the rest safe, he was quartered alone in a small hut which the Americans had left us. It was a poor shelter, being built of turf, and roofed with boughs and grass, but as good as any we had. There was no surgeon among us, and handing him food or drink was deemed a perilous business; but all his comrades had a sort of a liking for Bill, and, besides, he was regarded as the palladium of the party. The fever was not violent, though Bill raved at times, and all his wanderings were after gold. I have heard him talk for half-hours together in a loud whisper, as if communicating a secret to some very dull ear, concerning a pool among rocks, with glistening sands, and something shining far down in a crevice. He was restless, too, and kept looking out on the track of the Indians after they had come and gone. One evening I observed him particularly so. The night fell with heavy rain; we

all took early to shelter, and slept so soundly, that Bill was forgotten among us; but in the morning we found him lying wrapped in his blanket, as thoroughly wet as if he had been dipped in the river, while the hut remained quite dry. Where he had been, or under what illusion of the fever, we could not learn, for he never spoke a rational word after. The wet and exposure increased his malady tenfold. He became fiercely delirious, and struck at whoever approached him, swearing he would let nobody kill him for his gold. The captain warned us all, that this was the most dangerous time for infection; but I saw that he and his brother had got wind of something, for their eyes were never off the hut.

Towards the second evening, Bill grew worse, his ravings became faint and low, and he lay gathered up on a corner of his mattress. I had placed a pitcher of water as near him as possible, escaping by chance a blow which the poor soul struck at me in his feverish fury; but I could not help thinking of him when we had all gone to rest. The night was so still, that I could hear the rush of the river and the cries of the night-hawks on its opposite bank; but being unable to sleep, I crept out of the tent, and looked to Bill's hut. A smothered sound of scuffling came from that direction, and stepping nearer, I saw by the rising moon, which just then shone with extraordinary brightness, two men struggling, as it seemed for life, in the narrow space between Bill's bed and the door.

'If you don't give me the full half, I'll tell them all,' said the voice of the captain's brother; but almost as he spoke, his antagonist threw him heavily back. I knew it was upon poor Williams, for a low moan reached my ear, and I sprang forward just in time to intercept the victor, who stumbled over me as he rushed out, and a heavy bag rolled from him. The next moment the other was at my side, and I stood face to face with the captain and his brother in the broad moonlight. The bag for which they had sneaked, and sinned, and scuffled, had burst by the fall, and its contents—stones, gravel, and sand, with some small sparkles of gold-dust amongst them—were scattered at my feet. Both stood stupified, and I stepped into the hut; but Bill was dead, and growing cold, with his stiff hands stretched out, as if clutching at something, and a wild expression of pain and anger in the ghastly face, which lay turned up to the moon. Her light filled the hut, and lay upon plain, and tent, and river. It was a glorious night, such as sometimes shines in the gold-country. I woke up my comrades, and told them what I had seen, but they all said: 'Poor Bill! How could they help it? and it was a good thing that the captain and his chum had been disappointed;' upon which every man composed himself again to sleep.

Next morning, the captain and mate were gone with all their traps, having joined, as we afterwards heard, a company returning to San Francisco. We laid Bill beside the gold-seekers who rested in the coppice, and our company broke up, and scattered away: some settled at San Francisco; some went to the United States; and I, having collected through so many hardships almost a pound of dust, returned to the employment I had left in London with such high contempt. From an old comrade, however, still located at the diggings, I heard by letter that a party of Americans had made a great discovery of gold among some rocks in a creek of the Sacramento, and that they had found, sticking fast in a crevice close by, a small spade marked with the name of Bill Williams, which the poor fellow had cut on the handle, as I well remembered, in one of his many idle hours. This explained to me Bill's long absence when he went to look for the Indians, his after-anxiety, and where he had been in the delirium of the fever, filling up that canvas bag which so fatally deceived the captain and his brother. The last I heard of these worthies was, that they had gone to the diggings

in Australia; and I never see gold in any shape without a recollection of their disappointment, and my own experiences in California.

HYGIENIC CHANGE OF AIR.

THE age of hygiene is rapidly approaching, when the exhibition of drugs will be the exception instead of the rule in medical treatment. For this reason, the effect of climate on disease is rising into a subject of first-rate importance, and, no longer a prejudice or a tradition, submits to the investigations of science. The chief recent writers on what we already presume to call climatology, are Sir James Clark in England, Schouw in Sweden, and Carrière in France; and now there comes Dr Burgess, armed with the united authority of these physicians, and with his own experience, to indoctrinate the public as well as the profession. His book is of moderate size and price, and we recommend it to all invalids, whether they are able to travel abroad, or are confined by circumstances to their own country; but in the meantime, as the subject is both new and interesting to general readers, we propose giving them an inkling of what it contains.*

We do not mean that the subject of climate is new in itself: it is only new in its treatment. We have all, from our earliest youth, heard of the effects of climate; we have all been brought up to believe in certain foreign places; and we have all observed that when—consumption, for instance—approaches its last stage (rarely before), it is shipped off, as a matter of course, for Italy or the south of France. And, alas! we have all heard from the wan lips of the stricken one excluded by poverty from the privilege of foreign travel: 'If I could but get to a warm climate, I should live!' Such notions, right or wrong, depended exclusively upon habit or prejudice. Experience had no effect upon them, any more than it had upon the orthodox course of medicines which entitled the death of a patient to be considered professionally legitimate. Sometimes, indeed, the venue was changed, and one place became more fashionable than another to die in. Here the group of English tombs grew gray and ancient, and there a new city of the silent sprang up with the suddenness of an American emporium. But still the cry was: 'A warm climate! Give us Italy, or we perish!'

But we need not say the cry was: it continues to this moment. Such impressions are long of being dispelled; it takes a great many years for the voice of doubt even to reach completely the public ear; and we think it a privilege to be able to take such advantage of our wide circulation as will give repining invalids to understand, that the advantages of a foreign climate are closely limited by one portion of the profession, and considered by another portion as highly problematical, if not entirely visionary. This applies, however, mainly to consumption; for the advantages of the climatic change are seldom denied in dyspepsy, rheumatism, scrofula, and the tribe of nervous diseases. Even in these, however, the locality chosen is rarely a proper one. There are countries which, if they could only obtain the stamp of fashion, would be invaluable to the invalid. 'The climate of Norway, for example,' says Dr Burgess, 'is admirably suited, during several months of the year, between the middle of May and the middle of September, for certain forms of dyspepsy, lesions of the nervous system affecting the mind, or that form of general innervation which results from an overwrought brain, and diseases of repletion. But Norway is little frequented, because it is not fashionable,

* *Climate of Italy in Relation to Pulmonary Consumption: with Remarks on the Influence of Foreign Climates upon Invalids.* By T. H. Burgess, M.D., &c. London: Longman, Brown, Green, & Longmans. 1852.

although it would be difficult to point out a more appropriate occasional residence for the numerous class of invalids just mentioned, than Christiania, with its picturesque environs, sublime scenery, and clear and rarefied atmosphere.'

The non-professional predilection in favour of a warm climate for consumption, may be referred, we suspect, to the analogy that exists between the earlier stages of that disease and those of a common cold. In fact, in most cases in this country, consumption is for a long time styled a cold; then it becomes a bad cold; then a worse; till it is impossible to withhold from it the more formidable name. A cold, however, it should be considered, occurs as frequently in summer as in winter; and in neither is it owing to the temperature, whether high or low, but to the *atmospheric changes*. The warmer the weather is, the greater will be the morbid effect of a cold draught of air. That a warm climate is *itself* is neither prevention nor cure in consumption, may be inferred from the prevalence of the complaint in all latitudes. In India and in Africa it is as rife as in any part of Europe. By the Army Reports from Malta, we find that upwards of 80 per cent. of the whole number of deaths throughout the year is caused by phthisis. In Madeira, according to Dr Heineken, Dr Gourlay, and Dr Mason, no disease is more common among the natives than pulmonary consumption. At Nice, it is stated by Dr Meryon, more natives die annually of consumption than in any town in England of the same amount of population. In Genoa, one of the most prevalent and fatal of the indigenous diseases is pulmonary consumption. In Florence, pneumonia is marked by a suffocating character, and rapid progress towards its last stage. In Naples, 1 death from consumption occurs in a mortality of $2\frac{1}{4}$; while in the hospitals of Paris, where phthisis is notoriously prevalent, the proportion is only 1 in $8\frac{1}{4}$. In short, in all the celebrated sanatoria to which we fly for relief, we find the disease as firmly established as at home.

If we examine the analogies presented by the history of the inferior animals, we find no argument in favour of a foreign climate. The fishes, birds, and wild beasts of one region, die in another. 'Man, although endowed in a remarkable degree, and more so than any other animal, with the faculty of enduring such unnatural transitions, nevertheless becomes sensible of their injurious results. For familiar illustrations of this influence, we have only to look to the broken-down constitutions of our Indian officers, or to the emaciated frame of the shivering Hindoo who sweeps the crossings of the streets of London. The child of the European, although born in India, must be sent home in early life to the climate of his ancestors, or to one closely resembling it, in order to escape incurable disease, if not premature death. Again, the offspring of Asiatics born in this country pine and dwindle into one or other of the twin cachexiæ—scrofula and consumption; and, if the individual survives, lives in a state of passive existence, stunted in growth, and incapable of enduring fatigue. If such extreme changes of climate prove obnoxious to the health of individuals having naturally a sound constitution, how are we to expect persons in a state of organic disease to be thereby benefited? In fact, view the subject in whatever light we may, we must eventually arrive at the natural and rational conclusion—that nature has adapted the constitution of man to the climate of his ancestors. The accident of birth does not constitute the title to any given climate. The natural climate of man is that in which not only he himself was born, but likewise his blood-relations for several generations. This is his natural climate, as well in health as when his constitution is broken down by positive disease, or unhinged by long-continued neglect of the common rules of hygiene.' It is Dr Burgess's theory, therefore, that when change is necessary, a modification of the patient's own climate—that

is to say, change of air in the same climate—is more in accordance with the laws of nature, and more likely to effect good, than a violent transition to warmer countries.

With regard to the curability of this disease, there is now, we believe, no doubt of the fact, although, unfortunately the process has not yet come completely into the hands of the physician. That a cure has frequently taken place, somehow or other, even in advanced stages of pulmonary consumption, has been demonstrated by *post-mortem* examinations; but nature herself seems, in these cases, to have been her own doctor, for no mode of treatment of general applicability has been discovered. Some think that the progress of tubercles may be arrested in the first stage—others, that nothing can be effected till the second. Some resort to the water-cure—others, to the still more marvellous Spanish baths of Panticosa; and others, again, swear by cod-liver oil. As to the last remedy, our author quotes the statements of Dr Williams, 'that the pure fresh oil from the liver of the cod is more beneficial in the treatment of pulmonary consumption than any agent, medicinal, dietetic, or regimenal, that has yet been employed. Out of 234 cases carefully recorded, the oil disagreed, and was discontinued, in only 9 instances. In 19, although taken, it appeared to do no good; whilst in the larger proportion of 206 out of 234, its use was followed by marked and unequivocal improvement—this improvement varying in degree in different cases, from a temporary retardation of the progress of the disease, and a mitigation of distressing symptoms, up to a more or less complete restoration to apparent health. The most numerous examples of decided and lasting improvement, amounting to nearly 100, have occurred in patients in the second stage of the disease, in which the tuberculous deposits begin to undergo the process of softening. The most striking instance of the beneficial operation of cod-liver oil in phthisis, is to be found in cases in the *third* stage—even those far advanced, where consumption has not only excavated the lungs, but is rapidly wasting the whole body with copious purulent expectoration, hectic, night-sweats, colliquative diarrhoea, and other elements of that destructive process by which, in a few weeks, the finest and fairest of the human family may be sunk to the grave. The power of staying the demon of destruction sometimes displayed by the cod-liver oil is marvellous.' Dr Burgess, however, although witnessing the same results even in far-gone cases, limits their duration to a year or eighteen months, after which the medicine lost its effect. Although the oil, therefore, is serviceable through the process of nutrition, he considers it no specific, and concludes on the subject thus: 'All that our present knowledge enables us to state positively on the subject is this: cod-liver oil is the most effectual stay to the progress of consumption, in a great majority of cases, that we possess; this salutary action is not always lasting, and there are cases in which its administration cannot be borne, and others in which it produces no good effects whatever. In those cases in which the stomach rejects the pure oil, if it be given in combination with phosphoric acid, it will generally be borne easily, and the acid will assist the tonic action of the oil.'

The non-professional notion respecting the curative powers of climate is, that by breathing a mild and soothing atmosphere, the phthisical patient withdraws irritation, and leaves nature at liberty to effect her own cure. But this, it seems, is entirely erroneous, inasmuch as it is through the skin, not the lungs, that a warm climate acts beneficially. When an atmospheric change takes place so as to produce a chill, 'whereby the cutaneous transpiration is instantly checked, the skin then becomes dry and hard, so that the respiratory organs suffer from the excessive action they now undergo, for the matter of transpiration must be eliminated through the lungs if the action of the skin

be interrupted.' This is illustrated by the instantaneous relief usually afforded by free perspiration in cases where difficult breathing and oppression of the chest have been occasioned by artificial heat. What really soothes, therefore, is *equability* of climate, not high temperature. Some authors even think that a cold climate is more suitable for consumption than a warm one, and point to Upper Canada, with its pure, dry, tonic atmosphere, affording hardly any trace of the complaint at all.

Here we might stop, as the nature of our work precludes our following Dr Burgess in his exposition of the action of climate on the lungs and skin; but it may be useful, and at anyrate amusing, to trace his iconoclastic progress through the popular shrines of Hygiea on the continent.

Malta is a famous resort for phthisical patients, although during the winter and spring the weather is cold and variable, and in autumn the sirocco is frequent. When a sirocco has blown for some days, it lulls suddenly, and is succeeded by an equally strong breeze from the north-west, contrasting violently with the former in temperature and everything else. The extremes of heat and cold are as great here and in other places in the Mediterranean as in London. In Malta, our author saw five or six cases of bronchitis, which in a single month terminated in incurable phthisis; and in two cases, six weeks only elapsed between the first signs of the tuberculous deposit and the death of the patients.

Madeira, a still more popular sanatorium for this disease, is a complete delusion. Instead of the climate being essentially dry, it is saturated with humidity during a great part of the year; and the peculiar sirocco of the place is of a hot, dry, irritating nature. An intelligent medical author, who had resorted to Madeira for change of air, remarks, that 'very frequent and remarkable variations in a given series of years, incontestably prove that Madeira is no more to be relied on than any other place for certainty of fine weather, and that it has equally its annual variations of temperature. . . . From what has been stated by writers, a person might be led to believe that disease was scarcely known there; but I am afraid, that were the subject thoroughly investigated, as it ought to be, few places would be found where the system is more liable to general disorder; while, at the same time, I suspect that the average duration of life would turn out to be inferior to that of our own country.'

Our author knows no place more unfavourable to patients suffering from organic diseases of the lungs, than the far-famed sanatoria—Aix and Montpellier. The atmosphere is pure, but ever and anon keen and piercing, and the *bise* and *marin*—one cold and cutting, and the other damp—irritate the lungs, and excite coughing. Add to this, that Provence is proverbially the land of dust, and, what is worse, the land of the *mistral*—a wind from the north-west, which carries stones, men, and carriages before it. 'For several days in spring the climate may no doubt be delicious, although, however, always too warm about mid-day, when suddenly the *mistral*, of evil celebrity, begins to blow. It is difficult to give an adequate idea of the change, or of the injurious effects of the climate under the influence of this scourge. The same sun shines in the same bright blue sky, but the temperature is glacial. The sun is there only to glare and dazzle, and seems to have no more power in producing warmth, than a rushlight against the boisterous winds, which chill the very marrow in one's bones. During the prevalence of this wind, it is impossible to stir out of doors without getting the mouth and nostrils filled with dust. All nature seems shrivelled and dried up under its baneful influence.'

Nice, likewise, is scourged by the *mistral*, which there,

however, divides its empire with winds from the north and north-east. 'But one of the greatest vices characterising the climate of Nice, if not the greatest, is the remarkable variation of temperature noticed between day and night—in the sun and in the shade. The land or continental winds prevail during the night; the southerly or maritime during the day. The former are cold and dry; the latter, soft and humid. As soon, therefore, as the former subside, and the sun rises in the horizon, the humidity commences to shew itself in the atmosphere; whilst, on the contrary, when the diurnal winds cease, and the sun sets, the above hygro-metric condition of the air disappears.' M. Carrière cannot conceive why our countrymen prefer Nice to a milder climate, and considers that the annual mortality in the English colony ought to discourage other hectic invalids from going thither.

Central Lombardy is, in general, characterised by marshy swamps poisoning the whole atmosphere with their miasmatic exhalations. The meteoric influences are decidedly cold and variable; and the 'extremes of temperature increase in proportion as we approach the valleys at the foot of the Central Alps, especially those most distant from the Adriatic coast.' This climate, our author tells us, cannot afford more benefit to the consumptive than that of the fens of Lincolnshire, or of the marshes of Holland. Brescia, Pavia, Mantua, and other Lombard towns, also share in this character; and at Verona, Mr B. Honan writes, that of all humbugs, the humbug of an Italian climate is the most intolerable.

At Genoa, although the air is pure and transparent in fine weather, it is liable to sudden gusts of wind and violent transitions dangerous to the invalid.

'In no part of England could a climate be found more unfavourable for consumptive invalids than that of Florence, a town built in a deep ravine, almost surrounded by the Apennines, and intersected by a squalid river. . . . Extreme cold in winter, great heat in summer, the prevalence of the northerly winds, the chilling effects of which are not always neutralised by the antagonistic winds, rapid and violent transitions, profoundly affecting the system, even in healthy persons; and combined with these violent atmospheric and thermal variations are also, in similar proportions, hygrometric and electric ever-changing influences.' Leghorn, the seaport of Tuscany, is built in a sunk locality, in the midst of a marshy country. Beggars, galley-slaves, assassins, smugglers, these are the picturesque portions of the inhabitants; and the promenade is an arid beach, anything but soothing to the respiratory organs. The English cemetery is a touching spectacle, with its numerous monuments of brilliant marble; among which stands conspicuous the tomb of Smollett.

Of Pisa, the grand central dépôt of Italy for foreign consumptive patients, Dr Burgess says: 'The excess of humidity and warm temperature of the Pisan climate depress the vital force, induce an overwhelming lassitude, and are, in my opinion, most unfavourable elements in a climate so generally recommended for pulmonary consumption. Whatever effect the humid mildness of the air may have in diminishing excitability, and in allaying pulmonary irritation in patients of a nervous temperament, it is decidedly injurious in those of a feeble and lymphatic habit. . . . The delusion of an Italian climate, as regards the cure or prophylaxis of tubercular consumption, is in no part of that country, so delightful to persons in sound health, more clearly portrayed than at far-famed Pisa. The stagnant life, the death-like silence, the dreary solitude of this dull town, whatever utility these elements may have in allaying the restless irritability of nervous and excitable patients, always produce serious evils upon those consumptive invalids of a melancholy turn of mind, or whose spirit is broken by hope deferred. Brooding over their melancholy condition, in a foreign land, away

from the comforts of home, without the solace and cheering influence of friends and relations, they soon break down and perish.' M. Carrière and Sir James Clark consider the climate of Rome adapted only for consumptive patients in the first stage of the complaint; but Dr Burgess, after a train of reasoning founded on scientific facts, comes to a conclusion consonant with his own theory, that it is not adapted for consumption in any stage or form whatever.

It is needless to follow our author to Naples, for this place is admitted by all writers to be injurious in cases of pulmonary consumption; but we may conclude this fragmentary survey by stating that, according to Dr Burgess, the least injurious portions of Italy are the Lake of Como and the city of Venice, *the air in neither of them being warm, but in both equable*. Here we end as we began: 'It is a mistake to suppose that a warm, humid, relaxing atmosphere can benefit pulmonary disease. Cold, dry, and still air, appears a more rational indication, especially for invalids born in temperate regions.' It will be seen that our author differs occasionally from both his great predecessors, Sir James Clark and M. Carrière; but even in so doing, he has at least the merit of fairly opening out a most important subject.

Let it be understood, that we have merely mentioned the nature of the contents of this volume, without attempting to follow Dr Burgess either in his reasonings or in the facts on which these are founded. We have now only to recommend the work as one that will be found highly interesting and suggestive, both by the medical and non-medical reader.*

THE DEVICE, OR IMPRESS.

If the various works of useful and ornamental art discovered in the sepulchres of nations long since fallen into oblivion, were of no other value, at the present day, than merely to be applied to the purposes which they were originally intended to subserve; if they did not elucidate the manners, customs, and progressional refinement of men with passions and feelings similar to our own; the labour and expense incurred by their exhumation would be thrown away. It is not, then, for the intrinsic value of the specimens to be produced, neither is it for any very particular admiration of the 'good old times,' but to exhibit and illustrate a very general and exceedingly active phase of our ancestors' minds, that, turning over the refuse materials of history, we proceed to disinter, from their worm-eaten pages, the dead and almost forgotten art of Device—an art that once claimed an extensive literature, and canons of criticism, peculiarly its own. From about 250 to 400 years ago, were the high and palmy days of this 'dainty art.' Then, the learned and subtle schoolmen of the age did not disdain to write upon it, with ink scarcely dry upon the pens with which they had been discussing the most abstruse dogmas of theology; then, not unfrequently, the cureless curate, by the concoction of a happy device for a generous patron, found himself a beneficed bishop. Nor is such preferment to be wondered at. The qualifications considered necessary to constitute a device-maker, were fully equal to those which Imlac described to Rasselas as requisite to form a poet. 'Philosophy and poetry,' wrote Père le Moyné, 'history and fable, all that is taught in colleges, all that is learned in the world, are condensed and epitomised in this great pursuit; in short, if there be an art which requires an all-accomplished workman, that art is device-making.' Ruscelli says: 'It belongs only to the most exquisite wits and best-refined judgments to undertake the making of devices.' Yet,

though the learned doctors of Padua, Wirtemberg, and the Sorbonne, engaged in deep disquisitions on the emblematical properties, natural and mythical, of cranes and crescents, sunflowers and salamanders, pelicans and porcupines—the length and language of mottoes—how the wind should be pictorially portrayed, with many other equally weighty considerations, still the chivalrous knights of the tourney, and the fair ladies of their *devoirs*, attained proficiency in the art. Wolf of Wolfrath, the lute-player, records, that at a grand tournament held at Vienna in 1560, crowns of laurel were awarded to the knights who wore the wittiest devices, as well as to those who excelled in feats of arms.

'But,' the reader very probably exclaims, 'what was this art of device?'

It consisted in translating an idea into a symbol, and illustrating that symbol by a tersely-expressed motto. 'The object of a device,' according to the Lord of Fossez, 'was to express covertly, by means of a picture and words, a conception of human wit;' and it was distinguished from an emblem, inasmuch as the emblem demonstrated something universal, whereas the device was peculiarly appropriate to the person who wore it. The old writers glory in its antiquity, citing many instances of its having been known and used by both Greeks and Romans. Even during the dark ages it was not entirely lost; it merely slumbered until the *renaissance*, and the invasions of Italy under Charles VIII. and Louis XII., when it awoke to a vigorous existence. Thus, though of much greater antiquity than heraldic blazonry, which only dates from the time of the Crusades, it was not hereditary, could be adopted or changed at pleasure, and did not define the rank of the wearer. Shakspeare, who well understood the nature of the device, distinguishes between it and armorial bearings in the passage where Bolingbroke recounts his injuries:

'Disparked my parks, and felled my forest woods;
From my own windows torn my household coat,*
Razed out my impress'—

The old heralds, however, looked upon the device with but little favour. Camden sneeringly says, that 'Armes were most usual among the nobility in wars till about some hundred years since, when the French and Italians, in the expedition of Naples, beganne to leave armes, haply for that many of them had none, and to bear the curtains of their mistresses' beddes, their mistresses' colours, as impresses in their banners, shields, and caparisons.' Daniel, one of our earliest English writers on the subject, is worth quoting for a definition of the impress, and to shew the exclusive spirit of the age. He says: '*Impress*, used of the Italians for an enterprise taken in hand, with a firm and constant intent to bring the same to effect. As if a prince or capitaine taking in hand some enterprise of war, or any other perticulaire affaire, desirous by some figure and motto to manifest to the world his intent, this figure and motto together is called an impress, made to signify an enterprise, whereat a noble mind levelling with the aime of a deep desire, strives with a stedy intent to gaine the prize of his purpose. For the valiant and hautie gentlemen, disdayning to conjoine with the vile and base plebeians in any rustique invention, have procured to themselves this one most singulare.'

Paul Jovius, a celebrated Italian historian and bishop, in his treatise on devices, says, that the figure or emblem, which he terms the *body* of the device, must be exactly fitted to the motto, which he terms its *soul*; and though it should not be so obscure as to require a sibyl to explain it, yet the motto ought to be in a foreign or dead language, so that it may not be comprehended by the vulgar—'such dainties not being

* We print the above as we received it from a respectable contributor, but without giving any opinion ourselves upon a subject of which we are not qualified to judge.—Ed. C. J.

* The armorial bearings or coat-armour of his house.

intended for vulgar appetites.' The human figure, also, should never be introduced into the emblem, and the motto ought not to contain more than three or four words. These rules, however, were not strictly adhered to, even by Jovius himself. The treatise is written in the form of a dialogue between the bishop and his secretary; its gossiping manner, quaint style, and the great importance attributed to the subject-matter, remind us exceedingly of the *Complete Angler* of our old English friend Isaak Walton. As an example of a perfect device, Jovius mentions one worn in the Italian wars by Antonio Colonna, the friend of Michael Angelo. It represented a branch of palm laid across a branch of cypress, with the motto, *Erit altera merces* (There will be another reward.) Another, highly praised by the old device-writers 'for being of subtle invention, and singular in outward view,' was assumed by a Spanish knight, Don Diego Mendoza, to signify the slight encouragement he received from the fair lady who was mistress of his affections. It represented a well, with a circular machine for raising water, full buckets ascending and empty ones going down, the motto, *Los llenos de dolor, y los vazios de esperanza* (The full one is grief; the empty, hope.) By the way, we find a similar figure in *Richard II.*, where the unfortunate monarch says:

'Now is this golden crown like a deep well,
That owns two buckets, filling one another—
The emptier ever dancing in the air,
The other down, unseen, and full of water:
That bucket down and full of tears am I,
Drinking my grief while you mount up on high.'

Jovius also warmly commends a device worn by Edward Stuart, Lord of Albany, a famous captain of tried valour in the French army, during their Italian campaigns. Of the blood-royal of Scotland, being cousin to James IV., he wore, as his arms, a lion rampant in a field argent; and as his device, a buckle, with the motto, *Distantia jungit*; 'thereby implying that he was the bond which held united the kings of France and Scotland, to countervail the forces of their natural enemy, the king of England.'

A quaint bit of romance, in connection with a lady's device, is perhaps worthy of notice. Hippolita Fioramonda excelled all the ladies of her day in beauty and courtesy, and wore, as her device, moths, embroidered in gold, on a sky-blue robe—a warning to the amorous not to approach too closely the light of her beauty, lest, like moths attracted by a lamp, they should be burned. There being no motto, one of her admirers, the Lord Lesui, a brave knight, famous for his horsemanship, asked her for an explanation of such a singular and imperfect device. She replied: 'It is to use the like courtesy to gentlemen who call to see me, as you do to those who ride in your company; you being accustomed to put on the tail of your horse a small rattle, to make him more fierce in kicking, so as to warn any who may approach you of the danger of his heels, thereby causing them to keep aloof.' Notwithstanding this repulse, the knight persevered, though unsuccessfully, in his suit, until he fell mortally wounded at the battle of Pavia. Then the lady Fioramonda relenting, had him sought for on the sanguinary field, and carried to her own house, where, to his great contentment, he died in her arms. Such imperfect devices, however, were considered unworthy of the name, unfit for men of gravity, and suited but to make sport with ladies. Of this description was that of Augustine Porco, a gentleman of Verona, who, being in love with a lady named Bianca, wore in his scarlet cap a small, real, white wax-candle, and perseveringly followed the lady to every place of public resort she visited. To the inquiries of his friends respecting this extraordinary device, he merely replied, that it signified *Candela bianca* (A white candle), and, consequently, doubts were

entertained of the eccentric gallant's sanity. At last, though love is proverbially blind, the lady—probably she had a prompter—discovered that the true meaning was *Can de la Bianca* (The dog of Bianca), and with her hand rewarded the ingenuity and perseverance of Signor Porco.

Through devices we obtain glimpses at the morals, as well as the manners, of a foreign people and a bygone age. The amorous devices of many ecclesiastical dignitaries afford a capital reason for the rule, that the motto should not be comprehensible 'by the vulgar.' That of Cardinal Medici, who loved the lady Julian Gonzago, was a comet surrounded by stars, the motto, *Micat inter omnes* (It shines among them all), from the lines of Horace:

*Micat inter omnes Julium sidus
Velut inter ignes luna minores.*

The allusion to the star of Julius in connection with the lady's name renders this device, in our opinion, rather neat and classical.

A still more startling sign of the times is exhibited by the device-loving bishop. He relates that one Mattei, a man of noble courage, when waiting with dissimulation and patience an opportunity to murder a person by whom he had been insulted, applied to him (Jovius) for an appropriate device; and the bishop, 'wishing to shew that a noble mind has power to digest, with time, every grievous injury,' designed an ostrich devouring a nail, with the motto, *Spiritus christi conquirit*. Mattei wore the device, and ultimately succeeded in assassinating his victim; and 'so much was this noble revenge commended,' that the pope promoted the ruffian to be captain of his guard—the family of the murdered man signing an agreement to cancel all future quarrels.

Great care was requisite, when framing a device, lest any part of it could be turned into ridicule by a witty or spiteful enemy. Charles the Bold, Duke of Burgundy, bore a flint and steel, with the motto, *Asse ferit quam flamma micet* (As he strikes, the fire flashes); and when defeated, and slain at the battle of Nancy, the day being cold, with snow on the ground, his triumphant enemy, the Duke of Loreno, said: 'This poor man, though he has great need to warm himself, has not leisure to use his tinder-box.'

However puerile the 'art' may appear to us now, there can be little doubt, that the construction of devices, as an incentive to the acquisition of general knowledge, and as a kind of mental training, was not altogether useless in its day, and formed a link, were it ever so slender, in the development of the human mind. Estienne, a noted French device-author, observes, that 'to express the conceptions of our own mind in the most perfect device, there is nothing so proper, so *gentile*, so powerful, or so witty, as the similitudes we discover when walking in the spacious fields of Nature's wonderful secrets; for the grace of a device, as well as the skill of him who makes it, consists in discovering the correspondence of natural qualities and artificial uses with our own thoughts and intentions.'

The old scholastic logic was freely employed in the arguments by which the device-authors advanced their own opinions, or attacked those of their contemporaries. Ammirato condemns the unphilosophical definition of Jovius—that the emblem is the body, and the motto, the soul of a device. With long, and, we must acknowledge, to us at least, not very intelligible argument, he maintains, that 'the motto is the major part of a syllogism, and the emblem the *minor*; from the conjunction of which the conclusion is drawn.' Unprofitable and uninteresting are these discussions. We shall, in preference, mention the canons of device-criticism, which were of most general prevalence.

Comparison was considered an essential property of a perfect device. Thus the Pillars of Hercules, with

the motto, *Plus ultra* (More beyond), adopted by Charles V., in allusion to the Spanish discoveries and conquests in America, and still to be seen on the coin of that nation, was, by the connoisseurs, termed a mere conceit. The scholar's two pens, with *His ad aethera* (By these fame), being also devoid of comparison, was equally inferior. Not more than three figures were permissible in the emblem, unless the greater number were of the same species. A device portraying an elephant, with a flock of sheep grazing quietly around, the motto, *Infestus infestis* (Hostile only to the wicked), was strictly correct, as the sheep, being all of one species, were recognised merely as one figure. Metaphor was not allowed in the motto: a device faulty in this respect, represented a ball of crystal, the motto, from Plautus, *Intus et in cute* (The same within and without); crystal being devoid of skin (*cutis*), the expression was metaphorical. The introduction of negatives into the motto was considered good: as a sundial, with *Ne aspiciatur non aspiciatur* (Unless looked upon—by the sun—it is not esteemed, or is of no use), a good device for a king's favourite; a flame of fire, with *Nunquam deorsum* (Never downwards); a gourd floating on a stream, with *Jactor non mergor* (Abandoned, but not sunk.) When the motto was taken from a well-known classic, fewer words were required: thus in a device representing a flame blown upon by the wind, with *Lenis abt flammis, grandior aura necat* (A gentle wind nourishes flame, a stronger, extinguishes), the words, *grandior necat* (a stronger, extinguishes) would have been sufficient. Nice discrimination was required in selecting the most suitable language for a motto. According to Contile, the Spanish was most suitable for love-matters; the Italian, for pleasant conceits; the Greek, for fiction; and the Latin, for majesty. Household furniture, and implements of husbandry, were considered improper subjects for the emblem of a device; consequently, that of the Academia della Crusca was set down as decidedly vulgar, it being a sieve, with *Il piu bel fior ne coglie* (It collects the finest flour of it)—a play on the word *crusca* (bran), assumed as the title of the Academy, from its having been instituted for the express purpose of purifying (sifting) the Italian language.

Objects that were not recognisable unless painted in colours, were also inadmissible; thus the otherwise clever device of the Earl of Essex—a rough diamond, with the motto, *Dum formas minus* (In fashioning, you diminish), came under the censure of the critics. In like manner, objects not easily distinguishable from others, were liable to the same condemnation. The celebrated device assumed by Mary Queen of Scots on the death of her first husband, Francis II., representing a liquorice-plant, with *Dulce meum terra tegit* (The earth covers my sweet), was pronounced faulty, because the liquorice-plant could not be readily distinguished from other shrubs, the roots of which wanted the property of sweetness so necessary to give point to the device. Unnatural or chimerical figures could not be admitted, excepting those to which tradition or classical authors had given fixed forms and attributes—as the mermaid, harpy, phoenix; consequently, a device representing a winged tortoise, the motto, *Amor addidit* (Love has added them), was improper. Qualities ascribed to animate or inanimate bodies by the ancients, were considered legitimate, though known by the moderns to be fictitious. Thus the dolphin, from the story of Arion, appears in devices as the friend of the distressed; the salamander, living in fire, typifies the strong passions, natural, yet destructive to their victims; the young stork, carrying the old one, illustrates filial piety; the crane, which, according to Pliny, holds a stone in its claw to avert sleep, is a fit emblem of watchfulness; the pomegranate, king of fruits, wears a regal crown; the crocodile, symbol of hypocrisy, sheds deceitful tears. In short, almost everything that was in the heavens above, in the earth

beneath, and in the waters under the earth, was seized by the device-maker, and converted into a symbol of some virtue, vice, or other quality of the mind. Nor was there only one emblem taken from each object; by varying the circumstances, they were multiplied to an enormous amount. Menestrier gives no less than 514 different devices, founded upon the properties of the sun alone.

Though devices previous to the reign of Henry VIII. were seldom worn in England, yet the insignia of the order of the Garter, instituted in 1350, in connection with its well-known motto and assumed origin, may be considered a genuine device. The next earliest we meet with was worn by Henry IV., and represented a blazing beacon, the motto, *Une sans plus* (One alone.) This motto has been termed inappropriate; but, considering that beacons were always placed at considerable distances from each other—one sufficing for a considerable district—we may conclude that the usurping Henry implied, that there was only one king in England, and that one was himself. Richard Duke of York, when he took up arms against Henry VI., assumed, as his device, a sun, partly visible only through thick clouds, with the motto, *Invitis nubibus* (Obscured by clouds.) After his death, his son Edward, in consequence of the success of the Yorkist cause, changed this device to a full sun unobscured. This was the sun of York so frequently alluded to by Shakspeare, and such a stumbling-block to his commentators. Henry VIII., on the occasion of his visiting Francis I. at the field of the Cloth of Gold, wore an English archer, dressed in Lincoln green, drawing his arrow to the head, the motto, *Cui adhaereo preest* (He whom I aid, conquers); a very significant intimation to Charles V. and Francis, both of whom were anxious for Henry's alliance against each other. Ann Boleyn wore a white-crowned falcon standing on a golden stem, from which sprouted red and white roses, with the motto, *Mihi et meae* (To me and mine.) This device of the fair and unfortunate Ann has survived to the present day. Now, emblematical of her fall, as it was once of her high station, it is degraded to be the sign of an ale-house, and known to the village toppers as the *Maggie and Stump*! 'The gentle Surrey of the deathless lay,' one of the last victims of the tyrant Henry, wore a broken pillar, with the motto, *Sat super est* (Enough remains.) One of the charges brought against him, when arraigned for high treason, was for wearing this very device. Mary, when she ascended the throne, wore a representation of Time drawing Truth out of a well, with the words, *Veritas temporis filia* (Truth is the daughter of Time); and Cardinal Pole wore a serpent surrounding the terrestrial globe, with the motto, *Estote prudentes* (Be ye cunning.) Both of those devices were very significant of the period and of their wearers.

The romantic amusements of Queen Elizabeth raised the device to the highest pinnacle of importance it ever possessed in this country. Hentzner, a German traveller, who visited the palace of Whitehall in 1598, says, that he saw in her majesty's bedroom 'a variety of devices on paper, out in the shape of shields, with mottoes, used by the nobility at tilts and tournaments, hung up there for a memorial.' As to Elizabeth herself, Camden states, that the enumeration of the various devices worn by her would fill a large volume. The generality, however, of the devices of that reign were fulsome flatteries, allusive to the Maiden Queen; such as—the moon, with the words, *Quid sine te cælum?* (What would Heaven be without thee?) or, Venus seated on a cloud, with, *Salva me Domina!* (Save me, O lady!) The best of the time was worn by the impetuous and ill-starred Essex, to signify his grief on one of the occasions when he had lost the queen's favour. It represented merely a sable field, surrounded by the words, *Par nulla figura dolori* (Grief cannot be painted.) The 'English Bayard,' Sir Phillip Sidney,

does not appear to great advantage in his devices. One, we presume intended to shew the steadfastness of his purpose, represented the tideless Caspian Sea, the motto, *Sine refluxa* (Without ebb.) Another of 'that famous soldier, scholar, and poet,' throws a curious light on the manners of the age. Camden tells us that Sir Philip, 'who was a long time heir-apparent to the Earl of Leicester (his uncle), after the earl had a son born to him, used at the next tilt-day following the motto, *Speravi* (I had hoped), with a dash across the word, thereby signifying that his hope was dashed.' Would any gentleman now thus publicly express his disappointment at such an event?

The pedantry of the first James was almost as favourable to devices as the pageantry of Elizabeth; but the days of chivalry, the glories of the triumph and the tilt-yard, were fast passing away, while the new arts of wood and copper-plate engraving were rising into eminence; and consequently devices, instead of being worn singly on the shields and trappings of knights and maskers, were soon found collected, and seasoned with poetry on the pages of printed books. These books of emblems, as they were termed, are by no means uninteresting; haply, at a future time, we may have an opportunity of referring to them. The early printers, we should observe, were the first who used devices on paper, each having a distinguishing emblem and motto, which they displayed on the title-pages of their works. We read of only one device worn by James; it represented the Scottish thistle united with red and white roses, the motto, *Rosas Henricus, regna Jacobus*, implying that as Henry united roses, James united kingdoms. Though foreign to our subject, we may mention here, as it is not generally known, that it was James who removed the red dragon of the Tudors from the royal arms, placing as a supporter in its stead the unicorn of Scotland. We meet with only one device of the unfortunate Charles. It represented a snake that had just cast its skin, the motto, *Paratior* (More ready.) During the civil war, many mottoes and figures were adopted by both the royalist and parliamentary parties, but few of them can be termed regular devices. With the Restoration, a new description of court amusement came into fashion, and the device soon became a prey to 'dull forgetfulness.' Many emblems, however, were then and subsequently assumed as crests, and a great number of mottoes were taken to point the moral, if any, of heraldic blazonry. Though repudiated and unrecognised by the strict herald, they are now generally considered to be the particular property and distinguishing ensign of certain surnames and families, and as hereditary as the quaint and fanciful charges and quarterings of coat-armour itself.

A COUNTRY WEDDING IN FRANCE.

No part of France, with the exception of Brittany, has preserved its patriarchal habits, national character, and ancient forms of language, more than Touraine and Berry. The manners of the people there are extremely primitive, and some of their customs curious and interesting. The following account is from the pen of a modern French writer of great power of observation and description.

It was in winter, near the time of the carnival, a season of the year when it is very customary to celebrate country weddings. In the summer, there is seldom time, and the farm-work will not allow of a three days' holiday, to say nothing of the slackened diligence which is the unavoidable consequence of a village festival. I was seated under the large kitchen chimney, when the firing of pistols, the barking of dogs, and the squeaking sounds of the bagpipe, announced

the approach of the betrothed couple. Presently after, old Maurice and his wife, with Germain and Marie, followed by Jacques and his wife, the chief respective kinsfolk, and the godfathers and godmothers of the betrothed, made their entrance into the yard.

Marie, not having yet received the wedding-presents, called *livrées*, was dressed in the best attire of her simple wardrobe: a coarse dark gown; a white handkerchief, with large flowers of gaudy colours; a red calico apron; a snow-white muslin head-dress, the shape of which called to mind the *coiffure* of Ann Boleyn and Agnes Sorel. Marie's features were fresh-looking, and lighted up with a smile, but without any expression of pride, albeit she had some good reason for such a feeling at this moment. Germain was grave and tender in his attentions to his betrothed, like the youthful Jacob saluting Rachel at the wells of Laban. Any other girl would have assumed an air of importance and triumph; for in all classes of society, it is something for a girl to be married for her sparkling eyes. But Marie's eyes glistened with tears of emotion and love; you could see at a glance that she was too deeply affected to be heedful of the opinion of others. Père Maurice was the spokesman on the occasion, and delivered the customary compliments and invitations. In the first place, he fastened to the mantelpiece a branch of laurel ornamented with ribbons: this is called the *exploit*—that is to say, the form of invitation. He then proceeded to distribute to each of those invited a small cross, made of blue and rose coloured ribbon—the rose for the bride, the blue for the bridegroom; and the guests had to keep this token—the women to deck their head-dress, and the men their buttonhole, on the day of the wedding. This is their ticket of admission to the ceremonies.

Père Maurice, after making his compliments, invited the master of the house and all his 'company'—that is to say, all his children, his kinsfolk, his friends, and servants—to the benediction, to the entertainment, to the feast, to the dance, and 'to all the rest;' observing with the usual form of words: 'I have done you the honour of bidding you to the wedding.'

Notwithstanding the liberality of the invitation carried thus from house to house, through the whole parish, the natural politeness of the peasants, which is remarkably discreet, prescribes that only two persons of each family should avail themselves of the summons—the head of the family and one of the children.

The invitations being concluded, the betrothed couple and their relatives repaired to dinner together at the farmhouse, after which Marie tended her three sheep on the common, and Germain went to work in the fields, as if nothing had happened.

The day before that appointed for the wedding, at two o'clock in the afternoon, the band of music arrived—that is to say, the *bagpipe*, and the man with the *triangle*—their instruments ornamented with long floating ribbons, and playing a march for the occasion, somewhat slow, indeed, for feet not indigenous to the country, but in perfect harmony with the character of the soil and the up-and-down nature of the roads in those parts. Some pistol-shots, fired by the young folks and children, announced the commencement of the nuptials. The company gradually assembled, and a dance was struck up on the grass-plot before the house. At nightfall, strange preparations were begun, the party separating into two bands; and when darkness closed in, they proceeded to the ceremony of the *livrées*, or present-making.

This took place at the house of the bride—Mrs Guillet's cottage. The good woman took with her her daughter; a dozen young and pretty *pastourelles*, Marie's friends and relatives; two or three respectable matrons, her neighbours, loquacious, quick of reply,

and rigid guardians of ancient usages; then she selected a dozen vigorous champions from her kinsmen and friends; and lastly, the old *chasseur* or flaxdresser of the parish, a man of eloquence and address if ever there was one.

The part that in Brittany is played by the *barzazan* or village tailor, is in our part of the country acted by the flaxdresser or woolcomber—two professions which are often united. He is present at all solemnities, gay or grave, being essentially a man of erudition and a good speaker; and on these occasions he has always to act as spokesman, and to execute well and worthily certain formularies of speech, in use from time immemorial. His wandering profession, which introduces the man into so many family circles, without allowing him to fix himself in his own, naturally serves to render him talkative and amusing, a ready story-teller, and an able man of song.

The flaxdresser is particularly sceptical. He and another rustic functionary, of whom we shall speak presently, the grave-digger, are always the *esprits forts* of the place. They are so much in the habit of talking of ghosts, and are so well acquainted with all the tricks of which these evil spirits are capable, that they scarcely fear them at all. It is especially in the night that all these worthies, grave-diggers, flaxdressers, and ghosts, exercise their industry. It is in the night also the flaxdresser relates his lamentable stories. But he is no more than the sacristan addicted exclusively to the pleasure of inspiring his auditors with fear; he delights in raising a laugh; and is jocose and sentimental by turns, when he comes to speak of love and Hymen. He is the man to collect and store up in memory the most ancient songs, and to hand them down to posterity; and, as usual, he was in the present instance the person charged with the presentation of the wedding-gifts at the nuptials of Marie.

As soon as all were assembled in the house, the doors and windows were closed with the greatest care; the very leucomb shutter of the granary was barricaded; planks, trussels, and tables were put up across all the points of egress, as if one was preparing to sustain a siege; and within this fortification reigned a solemn silence of expectation, until from a distance were heard singing, laughter, and the sound of rustic instruments. These were the bridegroom's band, Germain at its head, accompanied by his stoutest companions, the grave-digger, kinsfolk, friends, and servants, who formed a joyous and solid *cortège*.

As they approached the house, however, they slackened their pace, consulted together, and were silent. The young girls, shut up in the house, had contrived to find little slits in the windows, through which they watched the procession as it arrived, and formed in order of battle. A fine chilly rain fell, which added to the excitement of the situation, whilst a large fire crackled and blazed on the hearth within doors. Marie would gladly have shortened the inevitable slowness of this state of siege: she did not at all like to see her betrothed dawdling about in the wet and cold; but she had no voice in the affair—nay, she had even to share ostensibly in the cruelty of her companions.

When the two camps were thus pitched in face of one another, a discharge of firearms from the party without doors set all the dogs in the neighbourhood in commotion: those belonging to the house flew to the gate, barking loudly; and the little children, whom their mothers vainly endeavoured to quiet, fell to crying and trembling with fear. The grave-digger, the bard and orator of the bridegroom, now stationed himself before the door, and in a pitiable voice began a dialogue with the flaxdresser, who was at the garret-window over the same door.

Grave-digger. Hollo! my good folks, my dear neighbours, for mercy's sake open the door.

Flaxdresser. Pray who may you be; and how come

you to take the liberty of calling us your dear neighbours? We don't know you.

G. We are honest folks in trouble. Don't fear us, my friends, but bestow your hospitality on us. The sleet falls fast, our feet are all frozen, and we have come such a distance that our shoes are worn out.

The flaxdresser inquires sharply who they are, and receives various ridiculous answers. At length the besiegers say—

Grave-digger. Well, then, if you'll not listen to reason, we shall enter by force.

Flaxdresser. Try, if you like. We are strong enough not to fear you; and as you are insolent, we shall not answer you any more.

So saying, the flaxdresser slammed to the wicket with a bang, and went down a ladder into the room below. He then took the bride elect by the hand, and the young folks joining them, all fell to dancing and shouting gaily, whilst the matrons of the party sang with shrill voices, and amidst shouts of laughter, at the people outside, who were attempting the assault. The besiegers, on their side, pretended rage; they fired their pistols at the doors, set the dogs barking, rattled the shutters, thumped the walls, and uttered loud cries.

The garrison at last seemed to manifest some desire to capitulate; but required as a condition that the opposite party should sing a song. As soon as the song was begun, however, the besieged replied with the second line; and so long as they were able to do this, they were safe. The two antagonists were the best hands in the country for a song, and their stock seemed inexhaustible. Once or twice the flaxdresser made a wry face, frowned, and turned to the women with a disappointed look. The grave-digger sang something so old that his adversary had forgotten it, or perhaps had never known it; but instantly the good woman took up the burden of the song with a shrill voice, and helped their friend through his trouble. At length the party of the bride declared they would yield, provided the others offered her a present worthy of her. Thereupon began the song of the *Wedding-gifts*, to an air as solemn as a church psalm, the men outside singing bass in unison, and the women answering from within in falsetto. In twenty couplets at least the men enumerate all the wedding-presents, and the matrons at length consent that the door should be opened.

On this being arranged, the flaxdresser instantly drew the wooden spigot which fastened the door on the inside—the only fastening known in most of the dwellings in our village—and the bridegroom's band rushed in, but not without a combat, for the lads who garrisoned the place, even the old flaxdresser and the ancient village dames, considered it their duty to defend the hearth. The invaders were armed with a goose stuck upon a large iron spit, adorned with bouquets of straw and ribbons, and to plant this at the fire was to gain possession of the hearth. Every effort was of course made to attain this object. Now came a veritable battle, although the combatants did not come to actual blows, and fought without any anger or ill-will. But they pressed and pushed one another so closely, and there was so much emulation in the display of muscular power, that the results might have been more serious than they appeared amidst the singing and laughter. The poor old flaxdresser, who fought like a lion, was pinned to the wall, and squeezed until he could hardly get breath. More than one hero was rolled in the dust, more than one hand was withdrawn bleeding from an attack on the spit. These sports are dangerous, and in consequence of the occurrence of serious accidents, our peasants have resolved to drop them. The enormous iron spit was twisted like a screw before it was at length flung across the fire-irons, and the conquest achieved.

There was now no lack of talk and laughter. Each one exhibited the wounds he had received; but as they were in many cases given by the hand of a friend, nobody complained. The matrons cleaned the stone-floor, and order was re-established. The table was covered with pitchers of new wine. When they had all drunk together, clinking their glasses, and had taken breath, the bridegroom was led into the middle of the room; and, furnished with a ring, he had to undergo a new trial.

During the contest, the bride had been concealed, with three of her companions, by her mother, her god-mother, and her aunts, who had seated the four young girls on a bench, in a corner of the room, and covered them with a large white cloth. The three girls had been selected of the same height as Marie; and this cloth veiling them from head to foot, it was impossible to distinguish one from another. The bridegroom was only allowed to touch them with the end of his switch, to point out which he guessed to be his bride. If wrong, he could not dance with the latter that evening, but only with the one he had selected in error.

The party then separated, to re-assemble at eight o'clock the next morning. At the appointed time, after a breakfast of milk-soup, well peppered to stimulate the appetite—for the nuptial-feast promised to be a rich one—all assembled in the farmyard. A journey of several miles had to be performed to obtain the nuptial benediction. Germain mounted the gray mare, which had been new shod and decked with ribbons for the occasion; the bride rode behind him; whilst his brother-in-law, Jacques, was mounted on the old gray, with the grandmother. The joyous cavalcade set out, escorted by the children on foot, who kept firing pistols and making the horses start. Mrs Maurice, the mother, seated with the children and the village fiddlers in a cart, opened the procession to the sounds of the little band of music.

A crowd was gathered at the *mairie* and the church to see the pretty bride. We must describe her dress, it became her so well. Her clean muslin cap, embroidered all over, had lappets trimmed with lace; a white kerchief, modestly crossed in front, left visible only the delicate outline of a neck rounded like that of a dove; her dress of fine green cloth set off her pretty figure; and she wore an apron of violet silk, with the *bavette* or bib, which the village lasses have since then foolishly given up.

At the ceremony of the *offrande*, Germain, according to custom, placed the *treizaine*—that is to say, thirteen pieces of silver—in the hand of his bride, and slipped on her finger a silver ring of a peculiar form, which had existed unchanged for ages, but which has now been replaced by the *alliance d'or*.

We pass over the ceremony of the wedding. The party remounted their steeds, and returned home at a rapid pace. The feast was splendid, and lasted till midnight, interspersed with song and dance. The old folks did not quit the table for fourteen hours. The grave-digger superintended the *cuisine*, and filled his part to admiration; in fact, he was famous in this line, and between the services, he left his cooking and joined in the dance and song. He was strong, fresh, and gay as a lark. On leaving a wedding-party, he would go and dig a grave, or nail down a coffin—a task of which he acquitted himself with pious care.

We now come to the third and most curious day of the nuptials, which is still strictly observed. As the ceremony of the *livrées* is the symbol of taking possession of the heart and home of the bride, that of the *chou* is the type of the fecundity of marriage. After breakfast the next morning, this performance commenced—a custom of ancient Gallic origin, which became gradually a sort of Mystery or Morality of the middle ages. Two lads disappear during the breakfast, go and dress themselves up, and then return,

accompanied by music, dogs, children, and firing of pistols. They represent a couple of beggars—husband and wife—covered with rags: they are called the gardener and his wife (*le jardinier* and *la jardinière*), and give out that they have the charge and the cultivation of the sacred cabbage. The man's face is bedaubed with soot and wine-lees, or sometimes covered with a grotesque mask. A broken pot or an old shoe, suspended to his belt with a bit of string, serves him to beg for and collect the offerings of wine. No one refuses; and he pretends to drink, and then pours the wine on the ground, in token of libation. He now feigns to be tipsy, and rolls in the mud; whilst his poor wife runs after him, reproaching him pathetically, and calling for help. A hand-barrow is now brought, on which is placed the gardener, with a spade, a cord, and a large basket. Four strong men carry him on their shoulders. His wife follows on foot, and the old folks come after with a grave and pensive air; then the nuptial procession march two by two to the measure of the music. The firing of pistols recommences, the dogs bark more loudly than ever at the sight of the gardener thus borne in triumph, and the children jeer him as he passes. The procession arrives at the bride's dwelling, and enters the garden. There a fine cabbage is selected—a matter which is not effected in a hurry, for the old folks hold a council, each one pleading for some favourite cabbage. Votes are taken; and when the choice is made, the gardener ties his cord round the stalk, and retreats to the further end of the garden, whilst the other actors in the comedy—the flaxdresser, the grave-digger, the carpenter, and the shoemaker—all stand round the cabbage. One digs a trench, advances, recedes, makes a plan, spies at the others through a pair of spectacles; and, in short, after various difficulties and mummeries, the gardener pulls the cord, his wife spreads her apron, and the cabbage falls majestically amidst the hurrahs of the spectators. The basket is then brought, the two gardeners plant the cabbage in it with all sorts of precautions; fresh earth is put round its root, it is propped with sticks, and carefully tied up. Rosy apples on the end of sticks, branches of thyme, sage, and laurel are stuck all round it, and the whole is decked with ribbons and streamers. The trophy is then replaced on the handbarrow with the gardener, who has to hold it upright, and prevent any accident. Lastly, the procession leaves the garden in good order, and to a measured march. On coming, however, to the gate, and again when they enter the court-yard of the bridegroom's house, an imaginary obstacle opposes their passage. The bearers of the burden stumble, raise a great outcry, draw back, advance again, and, as if repelled by some invincible force, pretend to give way under their load. Meantime the bystanders keep exclaiming, to excite and encourage the bearers: 'Bravo!' 'Well done, my boys!' 'Courage!' 'Have a care!' 'Patience!' 'Stoop now; the gate is too low!' 'To the left—now to the right!' 'Look sharp now!' 'Now you're through!'

On reaching the court-yard of the bridegroom, the cabbage is lifted off the barrow, and carried to the highest point of the house—whether a chimney, a gable, or a pigeon-house. The gardener plants it there, and waters it with a large pitcher of wine, whilst a salvo of pistol-shots, and the joyous contortions of the *jardinière*, announce its inauguration. The same ceremony is immediately recommenced: another cabbage is removed from the bridegroom's garden, and carried with the same formalities to the roof of the house which his wife has just quitted. These trophies remain there, until the wind and rain destroy the baskets, and carry away the plants; but they generally remain long enough to verify the predictions of the village dames, that ere their removal, the new-married couple shall be blessed with a pretty little addition to their domestic happiness.

The day is far advanced when these ceremonies are

accomplished, and all that remains, is to escort with music the parents of the young couple to their homes. There they have a dance, and all is over.

NOBLE INSTANCE OF TURKISH GENEROSITY AND HONESTY.

I HAPPENED, a short time ago, to be in company with a retired shipmaster in Liverpool, who, after spending forty-five years of his life chiefly in command of vessels from that port, had retired to enjoy the fruits of a well-deserved competency. The conversation turned upon the difficulty, nay, almost the impossibility, of being able, in this highly-civilised and moral country, in the ordinary business of life, to trust only to the word or honour of the contracting parties. The Ancient Mariner fully agreed with me in my opinions, and said, that during a long intercourse with his species in every quarter of the globe, the only men he had met with whose words were equal to their bonds, or whose honesty would stand the test of being trusted with untold gold, were—the *Turks*. On my expressing surprise at this unqualified encomium in favour of a set of men on whom, as a nation, we have generally been accustomed to look with distrust and suspicion, the old gentleman said: 'I will give you an account of the circumstances which first led me to form this opinion, and leave you to judge for yourself'; and added, that during an occasional intercourse with them, extending over a period of twenty years, he had had it only the more strengthened and confirmed. He then said: 'It is now upwards of thirty years since I had, for the first time, any intercourse with the Mediterranean: our vessel was chartered to Constantinople; and one of the principal owners, a Liverpool merchant, was aboard acting as his own supercargo. Although it was my first acquaintance with the *Turks*, it was not *his*, as the sequel will shew.

'As we approached our destination, we availed ourselves of the customary aid of one of the local pilots; but he who on this occasion undertook the responsibility, proved but an inexperienced guide; and from some mistake in his bearings, ran the vessel upon a sandbank, from which every effort to dislodge her, laden as she was, proved unavailing. We were on a bleak part of the coast, and not more than half a mile from the shore, although a considerable distance from our destined port. It was necessary, therefore, to take out several boat-loads of the cargo, and send them on shore, whatever might be the risk they ran of being left there, while we were getting the ship afloat again. On expressing my fears as to their safety to the merchant whose property the goods were, he at once said: "I know the *Turks*, and will abide the consequences of the step;" although, situated as we were, we could not shrink from the results, whatever they might be, without incurring a much heavier loss, if not the entire destruction of the vessel. Accordingly, the boats were got out, and part of the cargo at once transferred to them, and conveyed to the shore, I acting as cockswain on the occasion. As the foremost boat approached, a number of turbaned figures were seen advancing, who, as soon as it touched the beach, rushed into the surf, and, with a shout, hauled it high and dry, and commenced at once to bear off its cargo to a field in the immediate neighbourhood, above high-water mark. Remonstrance or resistance would have been equally out of the question, as neither understood a word the other said, and their numbers were overpowering. So rapidly did the goods vanish from the boat under their active operations, that I had not even time to take a note of the particular packages. As soon as the boat was emptied of its contents, they assisted in pushing it off again into deep water; and in a very desponding state of mind regarding the ultimate fate of the goods which I had left on shore, I returned to the ship. On expressing my fears on that score to the merchant, who met me at the gangway, he smiled, and said: "It's all right. I saw by the turbans and dresses of the men who came down to you that they were *Turks*; and I know, from experience, that we run no risk whatever in leaving the goods under their self-imposed guardianship." As he was the party who was most interested in the result, I said nothing more, but

proceeded to lighten the ship as speedily as possible, by making several additional trips to the shore with as much of the cargo as enabled us to get at the ballast; and on each occasion we received the same prompt and energetic assistance from our turbaned allies, each boat-load being carried to the corner of the field where the others were deposited. It required two days to get the ship sufficiently lightened of her ballast, so as to get her afloat again, and this we were enabled to do without her sustaining any damage of a serious nature, as the weather, fortunately for us, continued perfectly calm.

'During these two nights that the goods were left on shore, they were watched by two of the *Turks* alone; and when we were ready for their reshipment, they assisted us as energetically in replacing them in the boat, as they did at first in removing them from it. On our last trip to the shore, the merchant went with us, and I took several pieces of gold with me, which I offered to the honest fellows who had so generously and voluntarily rendered us such efficient service; when, to my still greater surprise, they, to a man, making a low bow, and muttering something, which to me was unintelligible, put their hands on their hearts, and refused to accept it. The merchant, who understood a word or two only of their language, said that he could make out that what they had said was, that *we were brothers*, and in *distress*, and that was enough to induce them to do what they could to assist us.

'Our vessel then proceeded on her voyage to Constantinople, which she reached in a short time, and got her cargo safely disembarked. While there, I occasionally met in the streets several of the men who had assisted us, and received from them in passing always a pleasing smile of recognition.'

I ask my readers whether they think that, if such a thing had occurred on almost any part of *our own coasts*, a similar result would have taken place? Is it not notorious, and a deep and indelible stain on the great proportion of our population on the coast, that on a wreck taking place, the natives not only pilfer all that they can lay their hands upon, but sometimes do not even hesitate, it is alleged, to extinguish any glimmering sparks of life that may be perceptible in the bodies of the unfortunate mariners who have been washed ashore—with a view to protect themselves in the possession of their basely acquired spoil? And is it not equally notorious, that so far from their doing anything to warn a ship in distress, that they see approaching their iron-bound shores, of its danger, and doing anything to prevent it, they very often shew false signals, so as to draw the unfortunate vessel upon the rocks which it is so anxious to avoid? Such practices are an everlasting disgrace to the natives of many parts of our coasts; and how nobly, therefore, does the conduct of the poor *Turks* contrast with it, and that, too, be it borne in mind, even when rendered to those whom they are taught to regard as *Infidels*!

My venerable informant also told me, that during an occasional intercourse, extending over a period of nearly twenty years, with the natives of several parts of Turkey, he had never met with a solitary instance even of dishonesty, or a departure from an agreement, the conditions of which had only been settled by a verbal engagement, even when the result would evidently be unfavourable to them.

LADY BETTY, THE HANGWOMAN.

[The following curious sketch is from Mr W. R. Wilde's *Irish Popular Superstitions*, printed in M'Glashan's *Readings in Popular Literature*. It does not refer to a superstition, but to one of those facts which exhibit as much of the preternatural as the wildest excursion of fancy. A portion of the little volume is reprinted from the *Dublin University Magazine*, and, for aught we know, Lady Betty may have made her appearance originally in that work.]

THE old jail of Roscommon stood, and, although now converted to other purposes, still stands in the market-place, in the centre of the town. It is an exceedingly high, dark, gloomy-looking building, with a castellated top, like one of the ancient fortresses that tower above

the houses in many of the continental cities. It can be discerned at a great distance; and, taken in connection with the extensive ruins of O'Connor's Castle, in the suburbs, and the beautiful abbey upon the other side of the town, seems to partake of the character of the middle-age architecture. The fatal drop was, perhaps, the highest in Ireland. It consisted of a small doorway in the front of the third storey, with a simple iron beam and pulley above, and the *lapboard* merely a horizontal door hinged to the wall beneath, and raised or let fall by means of a sliding-bolt, which shot from the wall when there was occasion to put the apparatus of death in requisition. Fearful as this elevated gallows appeared, and unique in its character, it was not more so than the finisher of the law who then generally officiated upon it. No decrepit wretch, no crime-hardened ruffian, no secret and mysterious personage, who was produced occasionally disguised and masked, piled his dreadful trade here. Who, think you, *gentle reader*—who now, perhaps, recoils from these unpleasant but truthful minutiae—officiated upon this gallows high?—a female!—a middle-aged, stout-made, dark-eyed, swarthy-complexioned, but by no means forbidding-looking woman—the celebrated Lady Betty—the finisheress of the law—the unflinching priestess of the executive for the Connaught circuit, and Roscommon in particular, for many years. Few children, born or reared in that county thirty, or even five-and-twenty years ago, who were not occasionally frightened into 'being good,' and going to sleep, and not crying when left alone in the dark, by *huggath a' Pooka*, or, 'here's Lady Betty.' The only fragment of her history which we have been able to collect is, that she was a person of violent temper, though in manners rather above the common, and possessing some education. It was said that she was a native of the County Kerry, and that by her harsh usage she drove her only son from her at an early age. He enlisted; but, in course of years, returned with some money in his pocket, the result of his campaigning. He knocked at his father's door, and asked a night's lodging, determined to see for himself whether the brutal mother he had left had in any way repented, or was softened in her disposition, before he would reveal himself. He was admitted, but not recognised. The mother, discovering that he possessed some money, murdered him during the night. The crime was discovered, and the wretched woman sentenced to be hanged, along with the usual dockful of sheep-stealers, Whiteboys, shop-lifters, and cattle-houghers, who, to the amount of seven or eight at a time, were invariably 'turned off' within four-and-twenty hours after their sentences at each assizes. No executioner being at hand, time pressing, and the sheriff and his deputy being men of refinement, education, humanity, and sensibility, who could not be expected to fulfil the office which they had undertaken—and for which one of them, at least, was paid—this wretched woman, being the only person in the jail who could be found to perform the office, consented; and under the name of Lady Betty, officiated, unmasked and undisguised, as *hangwoman* for a great number of years after; and she used also to flog publicly in the streets, as a part of her trade. Numerous are the tales related of her exploits, which we have now no desire to dwell upon. We may, however, mention one extraordinary trait of her character. She was in the habit of drawing, with a burnt stick, upon the walls of her apartment, portraits of all the persons she executed.

THE WILL AND THE WAY.

I learned grammar when I was a private soldier on the pay of sixpence a day. The edge of my berth, or that of my guard-bed, was my seat to study in; my knapsack was my bookcase, and a bit of board lying in my lap was my writing-table. I had no money to purchase candle or oil; in winter, it was rarely that I could get any light but that of the fire, and only my turn even of that. To buy a pen or piece of paper, I was compelled to forego some portion of food, though in a state of half-starvation. I had not a moment of time that I could call my own; and I had to read and write amid the talking, laughing, singing, whistling,

and bawling of at least half a score of the most thoughtless of men—and that, too, in the hours of their freedom from all control. And I say, if I, under these circumstances, could encounter and overcome the task, is there—can there be, in the whole world, a youth who can find an excuse for the non-performance?—*William Cobbett.*

PAPER-MILLS.

A return has been made of the number of paper-mills at present at work in England, Wales, Ireland, and Scotland; also of the number of 'beating-engines' in each mill. From this it appears that there are in England 304 paper-mills at present in activity, having 1267 beating-engines at work, and 107 silent. In Scotland, there are 48 mills, having 278 beating-engines at work, and 8 silent. In Ireland, there are 28 mills, having 71 beating-engines at work, and 15 silent. In Wales, there are no paper-mills. The total is, 880 mills, having 1616 beating-engines at work, and 130 silent.

LINES TO —.

O COULD I love thee, love as thou art worthy to be loved,
Thy deep, thy constant tenderness my purpose might have moved.

I know, might I accept thy heart, a blissful lot were mine;
Would we had earlier met—but no! I never could be thine.

I love thee as a sister loves a brother kind and dear,
And feel a sister's thrilling pride whene'er thy praise I hear;
And I have breathed a sister's prayer for thee at Mercy's throne,
And ne'er a truer, purer love might sister's bosom own.

I knew this trial was in store; I felt it day by day;
And oft in agony I prayed this cup might pass away;
And yet I lacked the power to tell, what thou too late
must hear,
To tell thee that another claims this heart to thee so dear.

Alas! that I must cause thee pain—I know that thou wilt
grieve—
For oh! thou art all truthfulness; thou never couldst
deceive;
And I have wept when anxious care sat heavy on thy brow,
Have wept when others wounded thee, and I must wound
thee now.

It may be that in after-years we yet shall meet again,
When time has cancelled every trace of this dark hour of
pain:

O may I see thee happy, blest, whate'er my lot may be,
And, as a sister and a friend, I shall rejoice with thee.

HARRIET.

PROCESS FOR PRODUCING TAPERED IRON.

In No. 430 of this Journal, page 207, there is some mention of the patented rolling process for tapering bar-iron by machinery. This important invention is not of American origin, as persons unacquainted with the facts might imagine: it was first practised at the Mersey Steel and Iron Company's works at Liverpool, and then patented by Mr William Clay in the United States. The Company mentioned were awarded for the manufacture the prize-medal of the Great Exhibition, and the silver medals of the Franklin Institute of Philadelphia, and the American Institute of New York.

Printed and Published by W. and R. CHAMBERS, High Street, Edinburgh. Also sold by W. S. ORR, Amen Corner, London; D. N. CHAMBERS, 55 West Nile Street, Glasgow; and J. M'GLASSAR, 50 Upper Sackville Street, Dublin.—Advertisements for Monthly Parts are requested to be sent to MAXWELL & CO., 31 Nicholas Lane, Lombard Street, London, to whom all applications respecting their insertion must be made.

PRICE 1½d.

ECONOMY IN DISTRIBUTION.

WE had lately occasion to proceed by an omnibus from a country town to a station on a railway, by which we were to return to the city where we have our customary abode. On arriving at the station, we learned that we should have to wait an hour for an *up* train, the omnibus being timed in relation to a *down* one, which was about to pass. Had this arrangement been the only one readily practicable in the case, we should have felt it necessary to submit uncomplainingly to the loss of our hour; but it really was not so. We had come in one of three omnibuses, none of which had more than two or three passengers. Why should not one have come at this hour with *down* passengers, and another come an hour later with *up* ones, thus by the same trouble giving more accommodation? We found that the three omnibuses are run by so many hotels, and that an arrangement for general convenience was impossible, as it might have interfered with the hotel business. On the continent, the government would have ordered matters otherwise: with us, the genius of *laissez faire* permits them to be as we describe.

It is in the same part of the country that a system exists amongst bakers, which we described many years ago in these pages. There are three towns, triangularly arranged, about ten miles from each other. One or more bakers in each has a van, in which he sends bread every day to the other two. As there is no witchcraft in the making of bread, it might be as well for the inhabitants of each town to be supplied by the bakers of their own place exclusively, and then the expense of the carriage would be saved. Such, however, is the keenness of competition in the case, that each baker strives to get supporters in the neighbouring towns, and willingly pays for van, horse, and driver in order to retain their custom. We presume each van goes thirty miles a day, and that there is not much less than 2000 miles of this unprofitable travelling weekly in connection with the three towns.

Any one who has a sincere respect for the principle of untrammelled industry, must lament to see these its abuses or drawbacks. But our commercial world is full of such anomalies. The cause is readily traced in the excessive number of persons engaged in the various trades. Not many years ago, the number of bakers in a town known to us, of the same size as one of those above referred to, was fourteen, while everybody acknowledged that four might have sufficed. In such circumstances, it is not wonderful that expedients like that of the van are resorted to, notwithstanding that it can only diminish the aggregate of profit derived by an already starving trade.

Few persons who walk along a street of nicely-decorated and apparently well-stocked shops, have the slightest conception of the hollowness of many of the appearances. The reality has been tested in part by the income-tax inquiry, which shews a surprising number of respectable-looking shops not reaching that degree of profit which brings the owner within the scope of the exaction. It may be that some men who are liable, contrive to make themselves appear as not so; but this cannot be to such an extent as greatly to affect the general fact. In the assessing of the tax, no result comes out oftener than one of this kind: Receipts for the year, L.2200; estimated profit at 15 per cent., L.330; deductions for rent of shop, taxes, shopmen's wages, and bad debts, L.193; leaving, as net profit, L.137. The commissioners are left to wonder how the trader can support his family in a decent manner upon so small a return, till they reflect that possibly a son brings in a little as a shopman, or a daughter as a day-governess; or that possibly an old female relative lives with the family, and throws her little income into the general stock. It is, after all, a fact capable of the clearest demonstration, that a vast number of shopkeepers' families maintain decent appearances upon an income below that enjoyed by many artisans—what goes, in the one case, for the decent appearances, being enjoyed in substantial comforts in the other, or else misapplied, to the degradation of body and mind.

The evil primarily lies in an erroneous distribution of industry. Where twenty men offer themselves to do a duty to society for which three are sufficient, it cannot be good for any party; whereas, were the extra seventeen to apply themselves to other departments of the labour required for all, it would be better times for the whole twenty. The light, easy, and pleasant occupations are those most apt to be beset by superfluous hands. Shopkeeping is generally easy, and often pleasant; hence the excessive number of individuals applying themselves to it. In the difficulties of the case, conspicuousness of situation, extravagant decoration, and abundant advertising, are resorted to, as means of obtaining a preference. Many, to help out profits, resort to tricks and cheating. The expense thus incurred, above what is necessary, in distributing certain goods, must be enormous. To bring most articles to the hands of the consumer should be a simple business. Every member of the public must feel that his clothes will be as good, coming from a ware-room on a third floor at L.30 a year, as from a flashy corner shop which costs L.300. He will feel that to make him buy a new hat when he needs one, it is not necessary that an advertising van should be continually rumbling along the streets. His tea and sugar from the nearest grocer cannot be any better because

of there being fifty other grocers within two miles of his residence, and forty of these not required. Yet, by reason of the great competition in nearly all trades, these vast expenses, which do nothing for the public, are continually incurred. Means misapplied are means lost. The community is just so much the poorer. And we must pronounce the superfluous shopkeepers, those who live by the rents of fine shops, and those who are concerned in the business of advertising beyond what is strictly necessary for the information of the public, as incumbrances on the industry of the country.

One unfortunate concomitant of competition is, that it prompts in the individual trader an idea which places him in a false position towards the general interest. It is the general interest that all things fit for use should be abundant; but when a man is concerned in producing any of those things, he sees it to be for his immediate interest that they should be scarce, because what he has to sell will then bring a greater price. It is the general interest that all useful things should be produced and distributed as cheaply as possible; but each individual producer and distributor feels that the dearer they are, it is the better for him. It is thus that a trade comes to regard itself as something detached from the community; that a man also views his peculiar trading interest as a first principle, to which everything else must give way. It might, indeed, be easily shewn, that whatever is good for the whole community, must be in the long-run beneficial to each member. He either cannot look far enough for that, or he feels himself unable to dispense with the immediate benefit from that which is bad for the public. In short, each trade considers the world as living for it, not it as living for the world—a mistake so monstrous, that there is little reason to wonder at the enormous misexpenditure to which it gives rise.

The idea essentially connected with these false positions, that *because* there are certain persons in a trade in a particular place, they *ought* to be there, and that the primary consideration regarding them is how to enable them to continue living by that trade—as if they were fixed there by some decree of Providence—is one of the most perverse and difficult to deal with in political economy. The assertion of any principle ruling to the contrary purpose, seems to the multitude of superficial thinkers as a kind of cruelty to the persons, the severity of the natural law being, by an easy slide of thought, laid to the charge of the mere philosopher who detects and announces its operation. In reality, those are the cruel people who would contentedly see a great number of their fellow-creatures going on from year to year in a misery, which, being brought upon themselves by ignorance, and the want of a right spirit of enterprise, can only be banished or lessened by their being rightly informed, and induced to enter upon a proper course.

If there were a right knowledge and just views of these subjects diffused through the community, a man would be ashamed to enter upon a business in which a sufficient number of persons was already engaged, knowing that he was thereby trifling with his time and fortunes, and perhaps encouraging in himself a love of ease, or some other desire which he was not entitled to gratify. He would rather go to some new country, where he might eat in rough independence the rewards of an actual toil. What is really required, however, is not that men should leave their own country, but enter upon such pursuits there as may preserve an equal instead of an unequal distribution of industry throughout the various fields in which there is something to be done for the general advantage. Distribution should be less a favourite department, and production more so. With more producers and fewer distributors,

the waste we have endeavoured to describe would be so far saved, and there would be fewer miserable people on the earth.

Even amidst all the delusions which prevail upon the subject, it is curious to observe that there is a strong current towards a rectification of what is amiss. The interests of the individual, which produce so much fallacy, after all bring a correction. The active, original-minded tradesman, seeing that, with an ordinary share of the entire business of his department, he can scarcely make bread and butter, bethinks him of setting up a leviathan shop, in which he may serve the whole town with mercery at a comparatively small profit to himself, looking to large and frequent returns for his remuneration. The public, with all its sentimentalism, never fails to take the article, quality being equal, at the lowest price, and accordingly the leviathan dealer thrives, while nearly all the small dealers are extirpated. Now this is a course of things which produces partial inconveniences; but its general effect is good. It lessens the cost of distribution for the consumer, and it decides many to take to new and more hopeful courses, who otherwise might cling to a branch of business that had become nearly sapless. Under-selling generally has the same results. When in a trade in which distribution usually costs 43 per cent., one man announces himself as willing to lessen this by 15 or 20 per cent., his conduct is apt to appear unbrotherly and selfish to the rest; but the fact is, that for goods of any kind to cost 43 per cent. in mere distribution, is a monstrosity; and he who can in any measure lessen that cost, will be regarded by the community as acting in the spirit of a just economy, and as deserving of their gratitude. These may be considered as the rude struggles of competition towards a righting of its own evils. The public sees two selfishnesses working in the case, and it naturally patronises that which subserves its own interest.

The waste arising from an over-costly system of distribution, will probably lead to other correctives of even a more sweeping kind than that of underselling, or the setting up of leviathan shops. For the greater number of the articles required for daily use, men begin to find that a simple co-operative arrangement is sufficient. A certain number agree to combine in order to obtain articles at wholesale prices; after which a clerk, shopman, and porter suffice to distribute them. They thus save, in many trades, as much as 15 per cent. So far from their being under any peculiar disadvantage as to the quality of the articles, they are rather safer than usual in that respect; and indeed a freedom from the danger of getting adulterated or inferior goods is one of the recommendations of the system. It would probably extend more rapidly, were it not for the difficulties attending the law of partnership, which, however, will in all likelihood be speedily removed.

We make these remarks on distribution mainly in the hope of saving individuals from entering upon a career in which, not being truly useful to their fellow-creatures, they have little to expect of good for themselves. At present, shopkeeping is limited by what an able writer of the day calls the *bankruptcy check*;* that is, men go into it, and remain in it, while they can just barely sustain themselves, not regarding that they do not and cannot thrive, and that they are only adding to a mass of idleness already burdensome to the community. What we desire is, to see men so far enlightened in the principles of economy, that they will be at least less apt to rush into fields where their help is not wanted. We wish to assist in creating a public opinion on this subject, which, fixing on shopkeeping in such circumstances the odium of a masked idleness, will tend to send the undecided into courses of real

* Mr F. O. Ward.

activity and serviceableness; thus securing their own good by the only plan which can be safely depended upon—that of first securing the good of the entire community.

THE VENDETTA.

IN the morning, we were off the coast of Sardinia, steaming rapidly along for the Straits of Bonifacio. The night had been tranquil, and the morning was more tranquil still; but no one who knew the capricious Mediterranean felt confident of continued fair weather. However, at sea the mind takes little thought for the morrow, or even for the afternoon; and as we sat in the warm shade of the awning, looking out to the purple horizon in the east, or to the rocky and varied coast to the west, I felt, and if the countenance be not treacherous, all felt that it was good even for landmen to be moving over waters uncrispd except by the active paddles, beneath a sky all radiant with light. My companions were chiefly Levant merchants, or sawtoe East Indians; for I was on board the French packet *Le Caire*, on its way from Alexandria, of Egypt, to Marseillo.

I had several times passed the Straits, each time with renewed pleasure and admiration. It would be difficult to imagine a scene more wild and peculiar. After rounding the huge rock of Tavolara—apparently a promontory running boldly out into the sea, but in reality an island, we are at once at the mouth of the Straits. The mountains of Corsica, generally enveloped in clouds, rise above the horizon ahead, and near at hand a thousand rocks and islands of various dimensions appear to choke up the passage. The narrow southern channel, always selected by day, is intricate, and would be dangerous to strangers; and indeed the whole of the Straits are considered so difficult, that the fact of Nelson, without previous experience, having taken his fleet through, is cited even by French sailors as a prodigy.

On one of the rocky points of the Sardinian coast, I observed the ruins of a building, but so deceptive in distance, I could not at first determine whether it had been a fortress or a cottage. I asked one of the officers for his telescope; and being still in doubt, questioned him as I returned it. He smiled and said: 'For the last five or six years, I have never passed through the Straits by day without having had to relate the story connected with that ruin. It has become a habit with me to do so; and if you had not spoken, I should have been compelled, under penalty of passing a restless night, to have let out my narrative at dinner. You will go down to your berth presently; for see how the smoke is weighed down by the heavy atmosphere upon the deck, and how it rolls like a snake along the waters! What you fancy to be merely a local head-wind blowing through the Straits, is a mistral tormenting the whole Gulf of Lions. We shall be tossing about presently in a manner unpleasant to landmen; and when you are safely housed, I will come and beguile a little time by relating a true story of a Corsican Vendetta.

The prophecy was correct. In less than a quarter of an hour, *Le Caire* was pitching through the last narrows against as violent a gale as I ever felt. It was like a wall of moving air. The shores, rocks, and islands were now concealed by driving mist; and as the sea widened before us, it was covered with white-crested waves. Before I went below, a cluster of sails ahead was pointed out as the English fleet; and it was surmised that it would be compelled to repeat Nelson's manœuvre, as Sardinia and Corsica form a dangerous lee-shore. However, the atmosphere thickened rapidly; and we soon lost sight of all objects but the waves amidst which we rolled, and the phantom-like shores of Corsica.

The officer joined me, and kept his promise. By constant practice, he had acquired some skill in the art of telling at least this one story; and I regret that I do not remember his exact words. However, the following is the substance of his narrative:—Giustiniani and Bartuccio were inhabitants of the little town of Santa Maddalena, situated on the Corsican side of the Straits. They were both sons of respectable parents, and were united from an early age in the bonds of friendship. When they grew up, Giustiniani became clerk in a very humble mercantile establishment; whilst Bartuccio, more fortunate, obtained a good place in the custom-house. They continued on excellent terms till the age of about twenty-one years, when an incident occurred, that by making rivals of them, made them enemies.

Giustiniani had occasion to visit the city of Ajaccio, and set out in company with a small party mounted upon mules. Bartuccio went with him to the crest of the hill, where they parted after an affectionate embrace. The journey was fortunately performed; in about a month Giustiniani was on his way back, and reached without incident, just as night set in, a desolate ravine within a few leagues of Santa Maddalena. Here a terrific storm of wind and rain broke upon the party, which missed the track, and finally dispersed; some seeking shelter in the lee of the rocks, others pushing right and left in search of the path, or of some hospitable habitation. Giustiniani wandered for more than an hour, until he descended towards the plain, and, attracted by a light, succeeded at length in reaching a little cottage having a garden planted with trees. The lightning had now begun to play, and shewed him the white walls of the cottage streaming with rain, and the drenched foliage that surrounded it. Guided by the rapidly succeeding gleams, he was enabled to find the garden gate, where, there being no bell, he remained for some time shouting in vain. The light still beamed gently through one of the upper windows, and seemed to tell of a comfortable interior and cosy inmates. Giustiniani exerted his utmost strength of voice, and presently there was a movement in the lighted chamber—a form came to the window; and, after some delay, the door of the house was opened, and a voice asked who demanded admittance at that hour, and in such weather. Our traveller explained, and was soon let in by a quiet-looking old gentleman, who took him up stairs into a little library, where a good wood-fire was blazing. A young girl of remarkable beauty rose as he entered, and received him with cordial hospitality. Acquaintance was soon made. Giustiniani told his little story, and learned that his host was M. Albert Brivard, a retired medical officer, who, with his daughter Marie, had selected this out-of-the-way place for economy's sake.

According to my informant, Giustiniani at once fell in love with the beautiful Marie, to such an extent that he could scarcely partake of the supper offered him. Perhaps his abstinence arose from other reasons—love being in reality a hungry passion in its early stage—for next day the young man was ill of a fever, and incapable of continuing his journey. M. Brivard and his daughter attended him kindly; and as he seemed to become worse towards evening, sent a messenger to Maddalena. The consequence was, that on the following morning Bartuccio arrived in a great state of alarm and anxiety; but fate did not permit him again to meet his friend with that whole and undivided passion of friendship in his breast with which he had quitted him a month before. Giustiniani was asleep when he entered the house, and he was received by Marie. In his excited state of mind, he was apt for new impressions, and half an hour's conversation seems not only to have filled him with love, but to have excited the same feeling in the breast of the gentle girl. It would have been more romantic, perhaps, had Marie been tenderly impressed

by poor Giustiniani when he arrived at night, travel-stained and drenched with rain, in the first fit of a fever; 'but woman,' said the sagacious narrator, as he received a tumbler of grog from the steward, 'is a mystery'—an opinion I am not inclined to confute.

In a few days, Giustiniani was well enough to return to his home, which he reached in a gloomy and dissatisfied state of mind. He had already observed that Bartuccio, who rode over every day professedly to see him, felt in reality ill at ease in his company, spoke no longer with copious familiarity, and left him in a few minutes, professing to be obliged to return to his duty. From his bed, however, he could hear him for some time after laughing and talking with Marie in the garden; and he felt, without knowing it, all the pangs of jealousy: not that he believed his friend would interfere and dispute with him the possession of the gem which he had discovered, and over which he internally claimed a right of property, but he was oppressed with an uneasy sentiment of future ill, and tormented with a diffidence as to his own powers of pleasing, that made him say adieu to Marie and her father with cold gratitude—that seemed afterwards to them, and to him when reflection came, sheer ingratitude.

When he had completely recovered his strength, he recovered also to a certain extent his serenity of mind. Bartuccio was often with him, and never mentioned the subject of Marie. One day, therefore, in a state of mingled hope and love, he resolved to pay a visit to his kind host; and set out on foot. The day was sunny; the landscape, though rugged, beautiful with light; a balmy breeze played gently on his cheek. The intoxication of returning strength filled him with confidence and joy. He met the old doctor herboring a little way from his house, and saluted him so cordially, that a hearty shake of the hand was added to the cold bow with which he was at first received. Giustiniani understood a little of botany, and pleased the old man by his questions and remarks. They walked slowly towards the house together. When they reached it, M. Brivard quietly remarked: 'You will find my daughter in the garden,' and went in with the treasures he had collected. The young man's heart bounded with joy. Now was the time. He would throw himself at once at Marie's feet, confess the turbulent passion she had excited, and receive from her lips his sentence of happiness, or—No, he would not consider the alternative; and with bounding step and eager eye, he ran over the garden, beneath the orange and the myrtle trees, until he reached a little arbour at the other extremity.

What he saw might well plunge him at once into despair. Marie had just heard and approved the love of Bartuccio, who had clasped her, not unwilling, to his breast. Their moment of joy was brief, for in another instant Bartuccio was on the ground, with Giustiniani's knee upon his breast, and a bright poniard glittered in the air. 'Spare him—spare him!' cried the unfortunate girl, sinking on her knees. The accepted lover struggled in vain in the grasp of his frenzied rival, who, however, forbore to strike. 'Swear, Marie,' he said, 'by your mother's memory, that you will not marry him for five years, and I will give him a respite for so long.' She swore with earnestness; and the next moment, Giustiniani had broken through the hedge, and was rushing frantically towards Santa Maddalena.

When he recovered from his confusion, Bartuccio, who, from his physical inferiority, had been reduced to a passive part in this scene, endeavoured to persuade Marie that she had taken an absurd oath, which she was not bound to abide by; but M. Brivard, though he had approved his daughter's choice, knew well the Corsican character, and decreed that for the present at least all talk of marriage should be set aside. In vain Bartuccio pleaded the rights of an accepted lover. The old man became more obstinate, and not only insisted

that his daughter should abide by her promise, but hinted that if any attempt were made to oppose his decision, he would at once leave the country.

As may well be imagined, Bartuccio returned to the city with feelings of bitter hatred against his former friend; and it is probable that wounded pride worked upon him as violently as disappointed passion. He was heard by several persons to utter vows of vengeance—rarely meaningless in that uncivilised island—and few were surprised when next day the news spread that Giustiniani had disappeared. Public opinion at once pointed to Bartuccio as the murderer. He was arrested, and a careful investigation was instituted; but nothing either to exculpate or inculpate him transpired, and after some months of imprisonment, he was liberated.

Five years elapsed. During the first half of the period, Bartuccio was coldly received by both M. Brivard and his daughter, although he strenuously protested his innocence. Time, however, worked in his favour, and he at length assumed the position of a betrothed lover, so that no one was surprised when, at the expiration of the appointed time, the marriage took place. Many wondered indeed why, since Giustiniani had disappeared, and was probably dead, any regard was paid to the extorted promise; whilst all augured well of the union which was preceded by so signal an instance of good faith. The observant, indeed, noticed that throughout the ceremony Bartuccio was absent and uneasy—looking round anxiously over the crowd assembled from time to time. 'He is afraid to see the ghost of Giustiniani,' whispered an imprudent bystander. The bridegroom caught the last word, and starting as if he had received a stab, cried: 'Where, where?' No one answered; and the ceremony proceeded in ominous gloom.

Next day, Bartuccio and his young wife, accompanied by M. Brivard, left Santa Maddalena without saying whither they were going; and the good people of the town made many strange surmises on the subject. In a week or so, however, a vessel being wrecked in the Straits, furnished fresh matter of conversation; and all these circumstances became utterly forgotten, except by a few. 'But this drama was as yet crowned by no catastrophe,' said the officer, 'and all laws of harmony would be violated if it ended here.' 'Are you, then, inventing?' inquired I. 'Not at all,' he replied; 'but destiny is a greater tragedian than Shakespeare, and prepares *dénouements* with superior skill.' I listened with increased interest.

The day after the departure of the married couple, a small boat with a shoulder-of-mutton sail left the little harbour of Santa Maddalena a couple of hours before sunset, and with a smart breeze on its quarter, went bravely out across the Straits. Some folks who were accustomed to see this manœuvre had, it is true, shouted out to the only man on board, warning him that rough weather was promised; but he paid no heed, and continued on his way. If I were writing a romance, if, indeed, I had any reasonable space, I would keep up the excitement of curiosity for some time, describe a variety of terrific adventures unknown to seamen, and wonderful escapes comprehensible only by landmen, and thus make a subordinate hero of the bold navigator. But I must be content to inform the reader, that he was Paolo, a servant of Giustiniani's mother, who had lived in perfect retirement since her son's disappearance, professing to have no news of him. In reality, however, she knew perfectly well that he had retired to Sardinia, and after remaining in the interior some time, had established himself in the little cottage, the ruins of which had attracted my attention. The reason for his retirement, which he afterwards gave, was that he might be enabled to resist the temptation to avenge himself on Bartuccio, and, if possible, conquer his love for Marie. He no longer entertained any hope of possessing her himself; but he thought that at least

she would grow weary of waiting for the passage of five years, and would marry a stranger—a consummation sufficiently satisfactory, he thought, to restore to him his peace of mind. Once a month at least he received, through the medium of the faithful Paolo, assistance and news from his mother; and to his infinite discomfiture learned, as time proceeded, that his enemy, whilom his friend, was to be made happy at last. His rage knew no bounds at this; and several times he was on the point of returning to Santa Maddalena, to do the deed of vengeance from which he had hitherto refrained. However, he resolved to await the expiration of the five years.

Paolo arrived in safety at the cottage some time after dark, and communicated the intelligence both of the marriage and the departure of the family. To a certain extent, both he and the mother of Giustiniani approved the projects of vengeance entertained by the latter, but thought that the honour of the family was sufficiently cleared by what was evidently a flight. Paolo was disappointed and puzzled by the manner of the unfortunate recluse. Instead of bursting out into furious denunciations, he became as pale as ashes, and then hiding his face in his hands, wept aloud. His agony continued for more than an hour; after which he raised his head, and exhibited a serene brow to the astonished servitor. 'Let us return to Santa Maddalena,' he said; and they accordingly departed, leaving the cottage a prey to the storms, which soon reduced it to ruins, and will probably ere long sweep away every trace.

Giustiniani reached his mother's house unperceived, and spent many hours in close conversation with his delighted parent. He did not, however, shew himself in the town, but departed on the track of the fugitives the very next day. He traced them to Ajaccio, thence to Marseille, to Nice, back to Marseille, to Paris, but there he lost the clue. Several months passed in this way; his money was all spent, and he was compelled to accept a situation in the counting-house of a merchant of the Marais, and to give up the chase and the working out of the catastrophe he had planned for his Vendetta.

A couple of years afterwards, Giustiniani had occasion to go to one of the towns of the north of France—Lille, I believe. In its neighbourhood, as my narrator told me—and on him I throw the whole responsibility, if there seem anything improbable in what is to come—the young man was once more overtaken by a storm, and compelled to seek refuge in a cottage, which the gleams of the lightning revealed to him. This time he was on foot, and after knocking at the door, was admitted at once by a young woman, who seemed to have been waiting in the passage for his arrival. She was about to throw herself into his arms, when suddenly she started back, and exclaimed: 'It is not he!' Taking up a candle, which she had placed on the floor, she cast its light on her own face and that of the stranger, who had remained immovable, as if petrified by the sound of her voice. 'Madam,' said he, brought to himself by this action, 'I am a stranger in these parts, overtaken by the storm, and I beg an hour's hospitality.'

'You are welcome, sir,' replied Marie, the wife of Bartuccio, for it was she; but she did not at the moment recognise the unfortunate man who stood before her.

They were soon in a comfortable room, where was M. Brivard, now somewhat broken by age, and a cradle, in which slept a handsome boy about a year old. Giustiniani, after the interchange of a few words—perhaps in order to avoid undergoing too close an examination of his countenance—bent over the cradle to peruse the features of the child; and the pillow was afterwards found wet with tears. By an involuntary motion, he clutched at the place where the poniard was wont to be, and then sat down upon a chair that stood in a dim corner. A few minutes afterwards, Bartuccio came joyously into the room, embraced his wife, asked her

if she was cold, for she trembled very much—spoke civilly to the stranger, and began to throw off his wet cloak and coat. At this moment the tall form of Giustiniani rose like a phantom in the corner, and passions, which he himself had thought smothered, worked through his worn countenance. Brivard saw and now understood, and was nailed to his chair by unspeakable terror, whilst Bartuccio gaily called for his slippers. Suddenly Marie, who had watched every motion of the stranger, and, with the vivid intuition of wife and mother, had understood what part was hers to play, rushed to the cradle, seized the sleeping child, and without saying a word, placed it in Giustiniani's arms. The strong-passioned man looked amazed, yet not displeased, and, after a moment's hesitation, sank on his knees, and embraced the babe, that, awaking, curled its little arms round his head—

A tremendous crash aloft interrupted the well-prepared peroration of the narrator; and, to say the truth, I was not sorry that a sail was carried away, and one of our boats stove in at this precise moment, for I had heard quite enough to enable me to guess the conclusion of the history of this harmless Vendetta.

WRECK-CHART AND LIFE-BOATS.

MANY of our readers are probably aware that Prince Albert, in his capacity of president of the Society of Arts, Manufactures, and Commerce, suggested that lectures should be delivered on the results of the different classes of the Great Exhibition, by gentlemen peculiarly qualified by their several professions and pursuits. This suggestion has been admirably carried out; but we propose at present to direct attention only to one of the twenty-four lectures in question—namely, that on life-boats, by Captain Washington, R. N.; our individual calling in early life having been such as to enable us to understand thoroughly the technical details, and judge of the accuracy of the views and opinions propounded by the gallant and intelligent lecturer.*

First, we will speak of the wreck-chart of the British islands prefixed to the lecture. Round the entire coast is a prodigious number of *black dots*, of two kinds—one a simple round dot, and the other having a line drawn through it. They all point out the locality of shipwrecks during the year 1850, and the latter dot shews the wreck to have been total. The English coasts are most thickly dotted, but this is to be expected from the greater proportion of shipping; next in the scale is Ireland, and then Scotland, which has comparatively few black dots, the densest portion being on the west coast, from Ayr to Largs, where we count eleven, nine indicating total wrecks. In the Firth of Forth there are but three, one total. A sprinkling of dots is seen among the Eastern Hebrides, but not so many as one would expect. Turning to England, we count about forty-five wrecks in the Bristol Channel alone, by far the greater number being total. On the Goodwin Sands there are fourteen, all total but one. On the Gunfleet Sands there are nine, four total. They are numerous on the Norfolk and Lincolnshire coasts, especially off Yarmouth and the Washway. On the Welsh coast, particularly around Beaumaris, Holyhead, &c., the number is very great. In the firth leading to Liverpool, we count no less than twenty-one, of which twelve are total. On the north coast of England the numbers are appalling. Off Hartlepool are fifteen, eight being total. Off Sunderland are twelve, all total but three. Off Newcastle are fifteen, eight total. Ah, that fearful, iron-bound coast of Northumberland! We have hugged it close in calm weather, with a fair breeze, and the views we caught of its shores made us shudder to think of what would befall a vessel on a stormy night and the shore alee. The following is the

awful summary of 1850:—'The wrecks of British and foreign vessels on the coasts and in the seas of the United Kingdom were 681. Of these, 277 were total wrecks; sunk by leaks or collisions, 84; stranded and damaged so as to require to discharge cargo, 304; abandoned, 16. Total wrecks, &c., 681; total lives lost, 784.'

Certain peculiar marks on this chart indicate the spots where life-boats are kept. In the vicinity of Liverpool we count no less than seven, and not one too many; but in many parts of the coast, where numerous wrecks occur, there are none. In all England there are eighty life-boats; in Ireland, eight; in Scotland, eight. A most portentous note on the chart informs us, that 'about one-half of the boats are unserviceable!' Think of Scotland, with its rocky seaboard of 1500 miles: only eight life-boats, and some of these 'quite unserviceable!' The boats at St Andrews, Aberdeen, and Montrose, have saved eighty-three lives; and the rockets at eight stations, sixty-seven lives. 'Orkney and Shetland are without any provision for saving life; and with the exception of Port Logan, in Wigtonshire, where there is a mortar, the whole of the west coast of Scotland, from Cape Wrath to Solway Firth—an extent of 900 miles, without including islands—is in the same state.' With regard to the chief distribution of English life-boats, there is one to every eight miles on the Northumberland coast; one to every ten miles in Durham and Yorkshire; one to fifteen miles in Lincolnshire; and one to five miles in Norfolk and Suffolk—a fact which, the lecturer well observes, is highly creditable to the county associations of the two last counties. But 'from Falmouth round the Land's End, by Trevoose Head to Hartland Point, an extent of 150 miles of the most exposed sea-coast in England, there is not one really efficient life-boat.' On the Welsh coasts are twelve boats, some very defective. At the five Liverpool stations are nine good boats, 'liberally supported by the dock trustees, and having permanent boats' crews.' These Liverpool boats have, during the last eleven years, assisted 269 vessels, and brought ashore 1128 persons. As to the Isle of Man, situated in the track of an enormous traffic, with shores frequently studded with wrecks, we are told that there is not a single life-boat; for the four boats established there by Sir William Hillary, Baronet, 'have been allowed to fall into decay, and hardly a vestige of them remains!' The paltry eight life-boats for the whole Irish coast of 1400 miles are stated to be likewise inefficient.

On the whole, it appears to us that the present number of efficient life-boats is not more than one-fourth of what ought to be constantly kept ready for immediate service. Only think of the amount of wrecks occurring occasionally in a single gale. On the 18th January 1848, not less than 108 vessels were lost on the British coasts. In 1846, nearly forty vessels were driven ashore in Hartlepool Bay alone. In the month of March 1850, the wrecks on our coasts were 134; in the gale of the 25th and 26th September 1851, the number wrecked, stranded, or damaged by collision, was 117; and in January of the present year, the number was 120. The above are the numbers actually ascertained; but it is well known that *Lloyd's List* is an imperfect register, although at present the best existing.

A secondary mode of communicating with a stranded vessel is by firing rockets with a line attached to them, by which means a hawser may be drawn from the ship and fastened to the shore. Mortars are likewise used for the same purpose; the latter plan having been invented by Sergeant Bell, and first tried in 1792. Bell's plan was very greatly improved by Captain Manby; and all the mortars now in use for the purpose are called after him. Mr Dennett, of the Isle of Wight, first introduced the rocket-plan in 1825. Rockets or mortars, or both, are kept at most of the coast-guard stations; but in numerous cases were found worthless on trial, owing

to the lines breaking, or the rockets being old and badly made. Nevertheless, at twenty-two stations, 214 lives have been saved by them. The evil is, that neither rockets nor mortars are of any use unless the wreck lies within a short distance of the shore; for the maximum range attained is only 850 yards, and in the teeth of a violent wind, often not above 200 to 300 yards. If a ship, therefore, is stranded on a low shelving shore, she is almost certain to be beyond the range of the life-rocket or of Manby's mortar. The main reliance, therefore, is the life-boat, and to it we return.

The Duke of Northumberland recently offered a reward for the best model of a life-boat. This offer was responded to by English, French, Dutch, German, and American boat-builders; and the amazing number of 280 models and plans was sent in. About fifty of the best of these were contributed by the duke to the Great Exhibition; and he had also a report and plans and drawings of them printed, of which he distributed 1800 copies throughout the world. Baron Dupin, chairman of the Jury of Class VIII., thus summed up the award of the jury concerning them:—'These models figure among the most valuable productions in our Great Exhibition, and furnish an example of liberality in the cause of humanity and practical science never surpassed, if ever equalled. Such are the motives from which we have judged his Grace the Duke of Northumberland worthy of receiving the Council Medal.'

The inventor of life-boats, as is well known, was Henry Greathead, of South Shields, in 1789. His boat was 80 feet long, with 10 feet breadth of beam, $3\frac{1}{2}$ feet depth of waist, stem and stern alike nearly 6 feet high, and pulled ten oars (double-banked.) A cork lining went fore and aft 12 inches thick, on the inside of the boat, from the floor to the thwarts; and outside was a cork fender, 16 inches deep, 4 inches wide, and 21 feet long. 'She could not free herself of water, nor self-right in the event of being upset.' She was launched in 1790, and in the year 1802, the inventor was rewarded by the Society of Arts with its gold medal and fifty guineas; and parliament voted him £1200, 'in acknowledgment of the utility of his invention.' Many presumed improvements and modifications of the original boat have been effected, with more or less success. James Beeching, a Yarmouth boat-builder, has carried off the prize offered by the duke, and we may therefore suppose his was the best of the models submitted. Captain Washington thus describes Beeching's model sent to the Exhibition: 'It may be seen from the model of that boat, that from her form she would both pull and sail well in all weathers; would have great stability, and be a good sea-boat. She has moderately small internal capacity under the level of the thwarts for holding water, and ample means for freeing herself readily of any water that might be shipped; she is ballasted by means of water admitted into a tank or well at the bottom after she is afloat; and by means of that ballast and raised air-cases at the extremities, she would right herself in the event of being upset. It will thus be seen, that this model combines most of the qualities required in a life-boat; and the boat which has since been built after it, and is now stationed at Ramsgate, is said to answer her purpose admirably.'

M. Lahure, of Havre, sent a full-sized boat of iron; and Mr Francis, of New York, also sent a model life-boat of corrugated galvanised iron. Captain Washington thinks, that if metal is used at all, it should be copper in preference to any other. For our own part, we can only say, that we have helped to build boats, though not life-boats, and we have helped likewise to man boats, but we should like to have good sound timber beneath our feet in preference to any metal whatever; and we should prefer cork for the floating substance to air-tight cases, or copper tubing, or any of the other contrivances that have been adopted to give buoyancy to a swamped boat. Air-cases are very

liable to leak, or may be stove in by the sea, or be crushed by coming in contact with the wreck or rocks, but cork can never be injured. And as to metal air-cases, it was found on opening the sides of a life-boat at Woolwich Dockyard, that her copper tubes, supposed to be air-tight, were corroded into holes; for copper will corrode when in contact with sea-water, especially when alternately wet or dry, as is the case in life-boats.

We cannot here follow Captain Washington through his critical and technical details, but we think it right to express our strong suspicion, that the much-lauded self-righting power of certain new life-boats is obtained only at the cost of greater liability to upset. Doubtless a boat can be made to right herself after a capsize, but this really seems to us something like locking the stable-door when the steed is stolen; for even if she rights the very instant after upsetting, three-fourths of the crew are almost certain to perish. We think it far more important to construct a boat that will hardly capsize at all, than to build one that will right itself after capsizing; for we repeat our opinion, that the latter boat will prove liable to upset just in proportion to her capability of self-righting.

Many fatal accidents have happened to life-boats; and the details of some mentioned by the lecturer are peculiar and interesting. On the coast of Northumberland, in 1810, one of Greathead's boats, after saving several crews of fishing-cobles, was returning to the shore, when a heavy sea overwhelmed her, and by its sheer weight and force broke her in two, and the whole of the crew, thirty-four in number, perished. In 1820, Greathead's original life-boat, after saving the crew of the ship *Grafton*, at Shields, struck on a rock, and swamped; nevertheless, the brave old boat—although she had not the boasted power of self-righting—preserved her centre of gravity, and brought both crews to land. At Scarborough, in 1836, the life-boat, in going out to a vessel, turned completely end over end, 'shutting up one of the crew inside, where he remained in safety, getting fresh air through the tubes in the bottom, and was taken out when the boat drifted, bottom upwards, on the beach: ten lives were lost.' In 1841, the life-boat at Blyth, Northumberland, capsized, and ten men were drowned. At Robin Hood's Bay, Yorkshire, in 1843, the life-boat capsized, three men remaining under her bottom, while others got upon it. The accident was seen from the shore, and five men put off in a coble, fitted with air-cases like a life-boat; but she almost immediately turned end over end, and two men were drowned. The life-boat herself drifted ashore, and the three men under her bottom were saved. In all, twelve lives were lost. But the most lamentable disaster that ever befell a life-boat was at South Shields, on December 4, 1849, when twenty-four men, all pilots, went off to rescue the crew of the *Betsy*, stranded on Herd Sand. 'The boat had reached the wreck, and was lying alongside with her head to the eastward, with a rope fast to the quarter, but the bow-fast not secured. The shipwrecked men were about to descend into the life-boat, when a heavy knot of sea, recoiling from the bow of the vessel, caught the bow of the boat and turned her up on end, throwing the whole crew and the water into the stern-sheets. The bow-fast not holding, the boat drove in this position astern of the vessel, when the ebb-tide, running rapidly into her stern, the boat completely turned end over end, and went on shore bottom up. On this occasion, twenty out of twenty-four—or double the proper crew—were drowned under the boat. On seeing the accident, two other life-boats immediately dashed off from North and South Shields, saved four of the men, and rescued the crew of the *Betsy*.' It is added, that the life-boats have been in constant use at Shields since Greathead first launched his boat there in 1790, and excepting the above accident, no life has ever been lost in them, or from want of them. Between 1841 and 1849, they saved 466 lives.

But good is frequently educed from evil, and it was this very disaster at Shields that induced the Duke of Northumberland to offer a premium for the best life-boat; and his Grace has now, with princely liberality, undertaken to place a well-built life-boat at each of the most exposed points of the coast of his own county, with rockets or mortars at every intermediate station.

As to dimensions, the existing life-boats are of three classes: from 20 to 25 feet long, from 25 to 30 feet, and from 30 to 36 feet. Some are only 18 feet long, and on thinly-inhabited coasts are the best, as unless a regular crew is provided, it is often difficult to man a large boat—at least efficiently. The largest boats are used at Caistor and Corton, in Norfolk, and are 40 to 45 feet long, weigh from four to five tons, and cost £200 to £250 each. They are said to be admirable vessels of the kind, and well manned. The 36 feet boat is used at Yarmouth, Lowestoft, Deal, &c., and always goes off under sail. The 30 feet boat is used at Liverpool, Shields, Dundee, &c.; and one of those at Liverpool brought sixty people ashore on one occasion. Some of the models sent to the Exhibition were of boats that did not weigh more than half a ton; but we fully agree with the lecturer, that a boat so light as that would never be able to pull out to sea in a head-wind. A life-boat ought to possess a certain weight, or momentum, or it will be driven back by the winds, or sucked back by the sea, like a feather.

It is exceedingly desirable that all life-boats should have regularly trained crews, for an ordinary sailor or fisherman is by no means competent to do properly the duty of a life-boatman. The cockswain, especially should be well trained.

Captain Washington remarks, that 'a careful examination of the returns of wrecks by the Coast-guard officers, forcibly impresses on the mind the painful conviction, that the greater part of the casualties that occur are not occasioned by stress of weather, but that they are mainly attributable to causes within control, and to which a remedy might be applied.' This has long been our own opinion, and we have again and again expressed it. 'Wherever the boats have been looked after, and the crews well trained, as at Liverpool, Shields, and on the coasts of Norfolk and Suffolk, the most signal success has rewarded their exertions. The first step is to insure a safe and powerful life-boat, and this, we feel confident, has been accomplished; the next is to build a sufficient number of such boats, place them where required, organise and train the crews, and provide for their supervision and maintenance. . . . There seems no reason why a very few years should not see a life-boat stationed at each of the exposed points on the most frequented parts of the coasts of the United Kingdom; by means of which—with the blessing of Divine Providence upon the endeavours of those who undertake the work—the best results to the cause of humanity may confidently be anticipated.'

THE SALONS OF PARIS.

News has just reached us from Paris of the death of Madame Sophie Gay. She was a writer of the half-historical, half-sentimental school of French fiction, of which Madame de Genlis, the Duchess d'Abrantes, and Madame de Souza were specimens more or less worthy; but in ease and grace, Madame Gay was superior to all we have mentioned. It is, in our minds, very affecting to witness the last lights of the ancient salons of Paris dropping out one by one. Mme Gay has herself, in a single volume published in 1837, entitled *Salons Célèbres*, left us a very beautiful picture of them as they were in their prime. We have translated—abridging, however, as we went—the opening chapters of this work, and may add a notice of more modern salons, as given by the lively pen of Mme Emile de Girardin—née Del-

phine Gay—daughter of Mme Sophie. The reader will judge whether the fashionable Frenchmen and Frenchwomen have really profited much by the storms and tempests that have gone over their heads. To be sure, Mme de Girardin's pictures were given twelve years ago; but we believe they would require little change, at least up to the conclusion of the Orleans reign in 1848. The volume from which these last extracts are made, is entitled *Lettres Parisiennes*. It has all the wit and talent of the cleverest of fashionable Frenchwomen. The tone is sometimes extremely good—better than we were led to expect; but the picture it presents is about as mournful a one as pictures of French frivolity usually are. We will, however, leave them to make their own impression. First, then, for Mme Sophie Gay and the ancient salons.

Now that the empire of the salons, she observes, has passed away with that of women, it would be difficult to convey to our youthful France an idea of the influence which certain of these were wont to exercise, in state affairs and in the choice of men in power. To have a salon is far from an easy thing; a crowd of people may, and do every day, give concerts and balls in their gilded apartments, and yet they may never have salons. Essential conditions are required which can rarely be found in conjunction. The most important of all is the talent and character of the lady who does the honours. Without being old, she must have passed the age in which a woman is chiefly spoken of for her prettiness or her dress, and be at that point of time when a woman's mind may rule over the self-love of a man more than her youthful attractions enabled her to rule over his heart.

Rank and fortune were important items, not quite indispensable, however; for Mme du Deffand was poor, and Mme Geoffrin was the wife of a manufacturer. In the salons of these two women edicts were framed, and academicians reared; but the questions discussed there were not nearly of the importance of those to which Mme de Staël's salon gave rise. It was essential that the mistress of the house should have a decided and superior taste in a variety of ways; also a total absence of those little, envious feelings which might have tended to exclude the fashionable woman or successful author. She must know how to bear enemies in her presence, to place talents according to their worth, to shew the tiresome way to the door—things which require address and courage.

The salon of Mme de Staël, during three different periods of her life, took considerable modification from the changes of the time; but it was always the same in power, if not in brilliancy.

Under the first Revolution, it was the scene of most momentous deliberations. Barnave, Talleyrand, Lameth, Dupont, Boissy d'Anglas, Portalis, Chénier, Roderer, and Benjamin Constant, discussed at the place of familiar meeting many a half-formed decree, and many important state nominations. The only member of the Directory who visited there was Barras; and it was a common saying, that every visit cost him a good deed; for Mme de Staël never slackened in her intercessions for the victims of the tribunals. She infused courage into the hearts of those who were pleaders for them. Through her means, Talleyrand was recalled, and even named minister of foreign affairs. 'He wanted some help,' she said, 'in order to arrive at power, but none to enable him to keep it when gained.' Her sagacity was at fault, if she persuaded herself that the returned emigrant-priest would bring harmony into public councils. On these evenings, pregnant with deeds both evil and good, it was said that some very foul conspiracies were concocted, and some of these were directly imputed to Mme de Staël; but she earnestly denied the truth of such surmises. Her salon, not herself, was guilty. Most generously did she exert herself in behalf of those who suffered after

such conspiracies; but some one was heard to say: 'She is a good woman, but would push any of her friends into the water for the delight of fishing them up again with her own tackle.'

When the Consulate was established, Mme de Staël's salon empire was watched by the rising influence of the day with a jealous eye. It was certainly a turbulent scene. Very bitter were the complaints of the men of the Revolution. They had risked so much; they had fought so courageously for liberty! They saw the disorders of the time, but they could not bear to lose all the fruits of their toil; and Garat and Andrieux, Daunon and Benjamin Constant, urged on by the eloquence of Mme de Staël, framed powerful appeals on these occasions for the morrow. Bonaparte could not tolerate this. His power was too recently gained—his projects too unripe. In vain did the friends of Mme de Staël say, that a *salon* could never be dangerous to a rule like his. 'It is not a salon,' said he; 'it is a club.' It was, in fact, the antagonism between mind and physical force. The First Consul had said before, of the orators of the Tribune: 'I have no time to answer these refractory speechifiers: they do nothing but perplex all things; they must be silenced.' And one great point of attack was Mme de Staël's salon. It was necessary she should abdicate her throne. A sentence of banishment condemned the brilliant lady to lay down the sceptre. Exiled to Geneva, surrounded by friends, sharing her father's lot, occupied with her daughter's education, she had, it may be thought, plenty of objects: she was unquestionably the first literary woman in Europe, too, and as such, Geneva was as her salon, where she received the homage of royalty and talent. Yet, a true Frenchwoman, unable to bear separation from the peculiar atmosphere in which she had been reared, she pined after it—pined still more for the friends who visited her only to be partakers of her exile; and so she passed the whole period of the Napoleon dynasty.

Meanwhile, in the interval between the banishment of Mme de Staël and her return, the most captivating mistress of a Paris salon appears to have been Mme de Beaumont. She was the daughter of M. de Montmorin, the minister of foreign affairs, who had immediately followed Necker. She married early, and not happily. She lived with her father, separated from her husband, and was intrusted to transcribe some of the very important correspondence between Mirabeau and the court. In the Reign of Terror, her father, and it is thought others of her family, fell by the guillotine; but she herself was spared, even against her will. She retired for awhile into the country, visiting among her friends, who did all they could to console her. She was the object of the strongest attachment on the part of Châteaubriand, Joubert, Fontanes, Molé, and many others; and when, once more, quiet and order were restored, even at the sacrifice of much of liberty, she came to Paris again. Her old friends rallied about her, her spirits seemed to revive for awhile, and her salon was for a year or two a scene of remarkable enjoyment. One who truly appreciated her, and who was worthy to be himself the centre of a social circle—M. Joubert, the author of some beautiful thoughts on literature and divers other subjects—thus tenderly commemorates the evenings to which we have alluded: 'Peaceful society! where none of those disuniting pretensions which spoil enjoyment could come; where acknowledged talent was not divorced from good temper; where praise was given to whatever was praiseworthy; where nothing was thought of but what was really attractive. Peaceful society! whose scattered members can never unite again without speaking of her who was the connecting link that brought them all together.'

To our minds, there seems something unique and infinitely touching in this bursting out, though but for

a short time, of the slumbering fires of an older society, from underneath the heaps of hard and alien material which had gone far to extinguish every spark of gentleness and refinement. The relics of families—their hearts still bleeding from their wounds—came to forget, if possible, the terrible past, and indulge their quiet hopes for the future. Very soon, indeed, the dream was dispelled; the tyranny proved to some unbearable; and some it vanquished in their highest part—their inward conscience—making them subservient when they might have shunned the danger altogether. But while the quiet interval lasted, it was like an Indian summer, prolonging the intellectual and tasteful beauty which was soon to be overwhelmed by the vulgar splendours of the Empire.

The greatest loss this circle could have had was the first. *Mme de Beaumont* died at Rome in 1804—attended only by *Châteaubriand*—who has given an account of the closing scene in his memoirs, and thenceforth it does not appear that the same society reassembled.

But another and third edition of the salon, under *Mme de Staël*, was witnessed at the Restoration. Hitherto we have sketched from *Mme Sophie Gay's* pictures. At this period, she declares herself unable to bear the mortification of mingling with the public of Paris: she could not see the Cossacks without shuddering. She shut herself up in her house, and knew what passed only through the kindness of friends, who wrote narratives for her amusement of any remarkable incidents they might note. Among these communications, *Mme Sophie Gay* has preserved one from the *Marquis de Custine*, and she has given it as a faithful picture of one of the last of *Mme de Staël's* soirées in Paris.

'I am just returned, and will not go to bed without telling you what has most amused me—not that amused is the right word, for *Mme de Staël's* salon is more than a scene of amusement: it is a glass in which is reflected the history of the time. What we see and hear there is more instructive than books, more exciting than many comedies. . . .

'You know that the Duke of Wellington was to visit her this evening for the first time. I went in good time; she was not yet in the room: several others were also waiting—such as the *Abbé de Pradt*, *Benjamin Constant*, *La Fayette*. They were conversing; I remained in one corner, as if listening to them. . . . At length *Mme de Staël* came in. "I am late," she said; "but it is not my fault. I was invited to dine at —, and was obliged to go." A great many of the guests were come: all were looking for the hero of the evening—we had seen him only as part of a show, now we wanted to hear him converse. At length he entered. The nobleness of his figure and simplicity of his manners produced a most agreeable impression on us. His pride, as it ought, has nearly the grace of timidity. *Mme de Staël*, impressed by a style and manner so little like that of our countrymen, said: "He carries his glory as if it were a nothing." Then, by a quick recall of patriotism, she whispered in my ear: "One must admit, however, that nature never made a great man at less expense." It seemed to me that the whole man was portrayed in these brief remarks.

'You would suppose, after this *début*, that we had a very pleasant evening: you shall judge. The Duke had not reached the end of the salon, when the *Abbé de Pradt* fastened on him, and actually forced him to listen for at least three-quarters of an hour, while he expressed his ideas—the ideas of the *Abbé de Pradt*!—upon military tactics. Conceive the wrath of *Mme de Staël*, and the annoyance of everybody there! *M. Schlegel* said, that he could fancy he was listening to that rhetorician who pronounced a discourse on the art of war to Hannibal.

'This remark did not make amends for the nuisance

of hearing in good French what we all knew before, when what we wanted was to listen to new things, in a foreign accent. Among the very few words which the English general was allowed to put in, I caught one sentence which struck me. While the *abbé* took breath, or coughed, the warrior had just time to tell us, that the most awful day in the life of a commander is that in which he has gained a battle; because, before having passed a night on the ground, and being assured on the morrow of the departure of the enemy, the conqueror cannot even know whether he is not conquered.

'Everything has its cost in this world, and if every man told us his secret, we should see that the most dazzling triumphs are paid for at their full price. However that may be, I thought there was sense and good taste in the Duke's remark. It seemed as if he tried to make us forgive him for exciting our curiosity so much.

'Many people went away discouraged by the bad manners of *M. de Pradt*. The hero himself was thinking of a retreat, when *Mme de Staël* came to release him from the ambuscade into which he had fallen. She retained him near the door, and there was a grave conversation on the English constitution. *Mme de Staël* could not reconcile the idea of political liberty, with the prevalence of servile forms remaining in the individual relationships of a society so jealous of that liberty as England.

"Language and aristocratic customs do not annoy people living in a country that is really free," said the Duke. "We use these unimportant formulæ in compliment to the past, and preserve our ceremonies as we keep a memorial, even when it has lost its primitive destination."

"But is it true," asked *Mme de Staël*, "that your lord chancellor speaks to the king on his bended knee during the opening address or sitting of parliament?"

"Yes; quite true."

"How does he do it?"

"He speaks to him kneeling, as I have told you."

"But how?"

"Must I shew you? You will have it!" answered the Duke; and he threw himself at the feet of our *Corinna*. "I wish everybody could see him," cried *Mme de Staël*.

'And everybody there did applaud with one accord. I would not answer for the same unanimity of approbation among the same people after they had reached the foot of the staircase!

'Everybody went away, only I stayed two hours with the mistress of the house and *M. Schlegel*, whose anger against the *abbé* did not wear out. Those two hours *Mme de Staël's* conversation enchanted me, proving how much there is to attach us in one who can live at one and the same time so near and yet so far above the world. . . . I might pass many evenings in recounting in detail the conversation of this evening. There is more than matter for a book in a two hours' talk with *Mme de Staël*. I had better go to bed, that I may be able to tell you to-morrow all I can only leave you to guess at now.*

And now we come to a later period, and *Mme Sophie Gay* shall give place to her lively and clever daughter *Delphine*, *Mme Emile Girardin*.

'Parisian society,' she writes, 'now, in 1839, offers the strangest aspect that ever was seen—a mixture of luxury and rudeness, English propriety and French negligence, political absurdities and revolutionary

* Perhaps the reader of the above will partake our own feeling of surprise at one circumstance which it records. How happened it, that the accomplished lady of a Parisian salon could not shield her chief guest, and all her guests, from the impertinence of one among them? To us this seems incomprehensible, and excites our suspicion that *Mme de Staël* could not have been among those mistresses of the science of tact, of whom elsewhere *Mme Gay* speaks. The whole charm of the evening was here allowed to be spoiled.

terrors, of which it is hard to form a just conception. The luxury of the salons is truly Eastern, not only the salons, indeed, but the anterooms: an anteroom in a handsome hotel is more richly adorned than the most beautiful drawing-room of the provincial prefecture. There, footmen more or less powdered—for there are rebels who choose to wear so little powder, that you would rather take them for millers in livery, than for servants of the anteroom—these self-styled powdered lackeys offer you a great book, bound in velvet, with the corners bronzed and gilt, in which you are asked to write your name. If the lady of the house is visible, you are pompously ushered into the sanctuary—that is to say, into the second salon or parlour, or closet, or *atelier*, whichever best assorts with the pretensions of the lady. A dog darts upon you, barks, makes a show of biting you; he is quieted, submits, and regains his purple cushion, growling. Dogs are very much in fashion: together with the fire, flowers, an old aunt, and two toadies, they make up part of the living accompaniments of a genteel salon. As you are an elegant person, of course you are ill-dressed: your coat is dusty, your boots speckled with mud, your hair uncombed, you exhale a strong odour of tobacco. At first glance, such things seem rather disagreeable, common, and inelegant. No such thing: this is exactly the most fashionable style we have; it seems to say: "I have just dismounted from the finest horse in Paris. I am a man of fashion, of that distinguished position in society, that I can go in a morning to call on a duchess, *dressed like a highwayman*."

'On the other hand, the mistress of the house is charming. One must do women the justice to say, that they never take a pride in ugliness; that they never make elegance to consist in appearing to the greatest possible disadvantage. The woman whom you are visiting, then, is dressed in the best taste. A beautiful lace cap covers her light hair; she wears a soft figured Gros de Naples; her stockings are of exquisite fineness; her shoes irreproachable (we doubt not they bear the mark of either Gros or Müller); her Valenciennes cuffs are irresistible: everything betokens care and fastidious nicety. The freshness of her appearance is a satire on the negligence of yours. One cannot comprehend why this elegant woman should have prepared herself in so costly a manner to receive this man; and in the evening, really the contrast is greater still. Young men no longer wear stockings when they go into a party; yet they dare not just yet present themselves in boots; and therefore they come in *brodequins*, like students. We are in the age of the *juste-milieu*; and this is appropriate enough. The *brodequin* is in its right place half-way between shoes and boots. These ill-dressed men are surrounded by women blazing in jewels and diamonds, coronets and diadems. It is impossible to believe that such differently dressed beings can be of the same country and station in society; and yet they are all talking and chirping together: and what conversation! what a conflict of subjects! what an inexplicable picture of forethought and thoughtlessness! or rather of apathy!

"And do you also believe in a revolution, M. de P—?" inquires a charming princess, spreading out her fan.

"Certainly, madame; and I hope we shall have one sooner than some may think."

"What! monsieur—you make me tremble."

"Can you, then, be afraid of a revolution which will bring about what you wish for?"

"No; but we shall have some cruel moments to pass through."

"Some may; but not everybody."

"Bah! revolutions make no selection; and then, when once the scaffold is set up—"

"How fast you travel, madame: in our day we shall never bear with scaffolds. The days of Terror will never return!"

"I think with M. de P—," chimes in a young dandy, playing with a Chinese ape on the table: "I rather look for civil war."

"I do not expect it; we have not energy enough for a civil war." . . .

"But you will have household assassinations, probably, if that will be any comfort."

"And then, the pillage of Paris!"

"Pillage!"

"Certainly." And every one cries:

"Oh, well, if there is pillage, I will be in it."

"I shall come to your house, madame," says one. "I shall carry away this beautiful vase."

"And I, the plate."

"And I, the charming portrait."

"I have no fixed idea yet. I shall come to your house to-morrow, madame, to choose," &c.

"All this will be very amusing; and yet, when the day comes, I shall not be sorry to be in Italy."

"Well, let us set out, then."

"Not yet, but soon. I will warn you when it is best to go." And so they talk on of all these horrible things, half buried under canopies of *lamps*, surrounded by flowers, by the light of thousands of wax-candles burning in golden lustres; and these women, who foresee such great catastrophes—tragic events, which may divide them from all they love, from parents, from friends—have beautiful dresses, with trimmings from England, and make the prettiest little gestures while speaking. It is because in France vanity is so deeply rooted that it leads to indifference. Presumption stands in lieu of courage. They believe in disasters, but only for others: they never seem to expect them for themselves.

So much for national character. If all this be a truthful picture, and really we see no reason for doubt, it does but add another to the many proofs of the springing elasticity of that element of light-hearted short-sightedness which is so proverbially characteristic of the French. But we will say no more, for our paper has already exceeded the limits we had assigned to it; and the things that *are* must ever prevail in our pages over those that have been.

THE OLD CASTLES AND MANSIONS OF SCOTLAND.

THE father of mental philosophy, Aristotle, begins his work on ethics by telling us, that nothing exists without some theory or reason attached to it. The following out of this view leads to classification—that great engine of knowledge. We see things at first in isolated individuality or confused masses. Investigation teaches us to separate them into groups, which have some common and important principle of unity, though each individual of the group may be different from the others in detail. Thus we arrive at the great classifications of natural science, with which every one is more or less familiar. But the works of men have their classification too, for in human effort like causes produce like effects. Most people know what schools of poetry, painting, and music are. In architecture, we know, too, that there are great divisions—such as classic and Gothic. But many have yet to learn how far classification may go; and it is a new feature to have the peculiar national architecture of Scotland separated from that of England, and its peculiarities traced to interesting national events and habits. The common observer is apt to think that all buildings are much alike, or that each is alone in its peculiarities. Before classification can take place, there must be a collection and comparison of leading characteristics;

and this is not easily accomplished with the edifices scattered over a whole country. It may be said that it was never done for Scotland, until Mr Billings completed his great series of engravings of the baronial and ecclesiastical antiquities of Scotland.

Taking the former—the baronial—for our text, we find ourselves now for the first time in a condition to discover the leading features of the Scottish school of architecture, and to connect it with the history of Scotland. We know that until the wars of Wallace and Bruce, the two countries, England and Scotland, could scarcely be said to be entirely separated; at all events, they did not stand in open hostility to each other. Endless animosities, however, naturally followed a war in which the one country tried to enslave the other, and where the weaker only escaped annihilation by a desperate struggle. It is not unnatural, therefore, to expect that the habits of the two countries diverged from each other as time passed on; and this process is very distinctly shewn in the character of the edifices used by the barons and lairds of Scotland. A very few of the oldest strongholds resemble those of the same period in England. The English baronial castle of the thirteenth century generally consisted of several massive square or round towers, broad at the base, and tapering upwards, arranged at distances from each other, so that lofty embattled walls or curtains stood between them, making a ground-plan of which the towers formed the angles. The doors and windows were generally in the Gothic or pointed style of architecture, and the vaulted chambers were frequently of the same. There are not above three or four such edifices in Scotland. The most complete, perhaps, is the old part of Caerlaverock, in Dumfriesshire; another fine specimen is Dirleton, in East Lothian; and to these may be added Bothwell, in Clydesdale, and Kildrummie, in Aberdeenshire.

This style was long followed in England. It is known as the baronial, and architects in all parts of the country, when building a modern mansion in the castellated manner, have invariably followed it. It is easy to see, however, that it was early abandoned in Scotland, the people not taking their forms of architecture from a nation with which they had no connection but that of hostility. The first species of national baronial architecture to which they resorted was a very simple one, characteristic of an impoverished people. It consisted of little more than four stone walls, forming what in fortification is called a block-house. The walls were extremely thick, with few apertures, and these suspiciously small. But these old towers or keeps were not without some scientific preparations for defence. In the more ancient baronial castles, the large square or round towers at the angles served to flank the walls or curtains between them; that is, supposing an enemy to be approaching the main gate, he could be attacked on either side from the towers at the angles. To serve the same purpose, the Scottish keeps had small bastions or turrets at the corners, which, projecting over the wall, flanked it on each face. The simple expedient here adopted is at the root of all the complex devices of fortification. The main thing is just to build a strong edifice, and then, by flanking outworks, to prevent an enemy from getting up to it. In other respects, these square towers were scarcely to be considered peculiarly Scottish. They are to be found in all parts of the world—along

the Wall of China; in the Russian steppes; in Italy, where they are sometimes remains of republican Rome; and in Central India. They constitute, in fact, the most primitive form of a fortified house.

When we come a century or two later, the difference between the English and Scottish styles becomes more distinct and interesting. Almost every one is acquainted with that beautiful style of building called in England the Tudor or Elizabethan, with its decorated chimneys, its ornamented gables, and large oriel or bow windows. It is not well suited for defence, and denotes a rich country, where private warfare has decayed. This class of edifice is rarely, if at all, to be found north of the border; but much as it is to be admired, a contemporary style sprang up in Scotland entirely distinct from it, yet, in our opinion, quite fitted to rival it in interest and beauty. It was derived, in some measure, from Flanders, but chiefly from France. The Scots naturally looked to their friends as an example, rather than to their enemies. Many of the Scottish gentry made their fortunes in the French service, and when they came home, naturally desired to imitate, on such a scale as they could afford, the châteaux of their allies and patrons. The state of the country, too, made it a more suitable pattern than the Tudor style. France was still a country of feudal warfare—so was Scotland; and it was necessary in both to have defence associated with ornament. The chief peculiarity of this new style was, the quantity of sharp-topped turrets, which form a sort of crest to the many details of the lower parts of the buildings. These are not solely ornamental; they succeeded the bastions of the old square towers, and served the same purpose. Among the secondary peculiarities of these buildings, may be counted an extremely rich and profuse ornamentation of the upper parts—probably the only portions out of the way of mischief. Indeed, the edifice is sometimes a mere square block for two or three storeys, while it is crowned, as it were, with a rich group of turrets and minarets, gables, window-tops, ornamented chimneys, and gilded vanes. In many instances, the great square block of older days received this fantastic French termination at a later time—as, for instance, the famous castle of Glamis, in Strathmore.

It almost appears as if this style, which has its own peculiar beauties, had been adopted out of a national antagonism to the contemporary style in England. The Tudor architecture has always a horizontal tendency, spreading itself out in broad open screens or wall-plates, diversified by occasional angular eminences—as, for instance, in the tops of the decorated windows. But in the Gallo-Scottish style everything tends to the perpendicular, not only in the long, narrow shapes of the buildings themselves, and their tall, spiral turrets, but in the many decorations which incrust them. This decoration has an extremely rich look, from the quantity of breaks, and the absence of bare wall or long straight lines. Thus, to save the uniform plainness of the straight gable-line, it is broken into small gradations called 'crow-steps.' Every one who looks at old houses in Scotland must be familiar with this feature, and must have noticed its picturesqueness. It appears to have been derived from the Flemish houses, where, however, the steps or terraces are much larger, and not so effective, since, instead of merely breaking and enriching the line of the gable, they break it up, as it were, into separate pieces.

The Scottish style has not, indeed, slavishly adopted any foreign model. It is, as we have remarked, chiefly

adopted from the French; but it has characteristics and beauties of its own. No one, we believe, had any conception of their extent and variety, until they were brought to light by the artistic labours of Mr Billings. In some instances, to bring out the full effect of the ornamental parts of these buildings without overloading his picture with the more cumbrous plain stone-work, he brings forward, by some artistic manœuvre, the crest of the building, as if the spectator saw it from a scaffold or a balloon level with the highest storey. The effect of the rich Oriental-looking mass of decoration thus concentrated is extremely striking, and one is apt to ask, if it is possible that the country so often characterised as bare, cold, and impoverished, could have produced these gorgeous edifices. Their number and distribution through the most remote parts of the land are equally remarkable. Among Mr Billings's specimens, we have, in the southern part of Scotland, Pinkie, near Musselburgh; Auchans and Kelburn, in Ayrshire; Newark, on the Clyde; Airth and Argyle's Lodging, in Stirling. Going northward, we come to Elcho and Glamis, and to Muchalls and Crathes, in Kincardineshire. It is remarkable, that the further north we go, the French style becomes more conspicuous and complete. Many of the finest specimens are to be found in Aberdeenshire. Fyvie Castle, which was built for a Scottish chancellor—Seton, Earl of Dunfermline—is almost a complete French château of the sixteenth century, such as the traveller may have seen in sunny Guienne or Anjou; and there it stands transplanted, like an exotic, among the bleak hills of the north. It is only natural to find in connection with such a circumstance, that Seton received his education in France, and passed a considerable part of his life there. Whether from such an example or not, the Aberdeenshire lairds seem to have been all ambitious of possessing French châteaux; and thus in the county of primitive rock, where there is certainly little else to remind us of French habits or ideas, we have some admirable specimens of that foreign architectural school in Castle Fraser, Craigievar, Midmar, Tolquhon, Dalpersie, and Udny. Nearer Inverness, we have Balveny, Castle-Stewart, and Cawdor.

The same foreign influence is exhibited in our street architecture, some specimens of which are engraved in the work to which we have referred.* Every one knows that the lofty Scottish edifices with common stairs—houses built above each other, in fact—give our large towns a character totally different from those of England; but it is equally clear that the practice was derived from France, where it is still in full observance literally among all classes, since the different social grades occupy separate floors of the same edifices. In the *coup d'état* of 1851, it will be remembered, that in making the arrests of the leading men supposed to be inimical to Louis Napoleon, one of the difficulties—as the affair took place at midnight—was to know the floors in which they lived; for these great statesmen and generals inhabited houses with common stairs.

We have here discussed one special feature of Mr Billings's work, on account of the remarks which it suggests; but it is only right to mention, before parting with it, that it contains engravings of every thing that is remarkable in the ancient architecture of Scotland, whether it be called civil and baronial or ecclesiastical. Certainly, the remains of antiquity in North Britain were never previously so amply and completely illustrated. Nor is it without reason, that some contemporary critics have maintained this to be the most entire collection of the sort which any nation possesses. The chief merits of the views consist in their accuracy and effect. They are wonderfully clear

and minute, so that every detail of the least importance is brought out as distinctly as in a model, while this is accomplished without sacrifice of their artistic effect as pictures.

AMERICAN HONOUR.

About seventy-five years ago, there was at Charleston, in South Carolina, a family consisting of several members. It belonged to the middle class—that is to say, contained barristers, bankers, merchants, solicitors, and so on—all of them animated, at least so far as appears, by a high sense of honour and integrity. But noble sentiments are no certain guarantee against poverty. One of the members of the family in question became embarrassed, borrowed £1000 of one of his relatives, but was soon after seized with paralysis, and, having kept his bed five years, died, leaving behind him a widow with several children. He could bequeath them no property, instead of which they received as their inheritance high principles, and a strong affection for the memory of their father. The widow also was, in this respect, perfectly in harmony with her sons. By dint, therefore, of prudence, industry, and economy, they amassed among them the sum of £400, which they rigidly appropriated to the repayment of a part of their father's debt. The old man had, indeed, called them together around his death-bed, and told them that, instead of a fortune, he left them a duty to perform; and that if it could not be accomplished in one generation, it must be handed down from father to son, until the descendants of the B—s had paid every farthing to the descendants of the S—s.

While matters stood in this predicament, the creditor part of the family removed to England, and the debtors remained at Charleston, struggling with difficulties and embarrassments, which not only disabled them from paying the paternal debt, but kept them perpetually in honourable poverty. Of course, the wish to pay in such minds survived the ability. It would have been to them an enjoyment of a high order to hunt out their relatives in England, and place in their hands the owing £600. This pleasure, which they were destined never to taste, often formed the subject of conversation around their fireside; and the children, as they grew up, were initiated into the mystery of the £600.

But that generation passed away, and another succeeded to the liability; not that there existed any liability in law, for though a deed had been executed, it had lapsed in the course of time, so that there was really no obligation but that which was the strongest of all—an unradicable sense of right. Often and often did the B—s of Charleston meet and consult together on this famous debt, which every one wished, but no one could afford, to pay. The sons were married, and had children whom it was incumbent on them to support; the daughters had married, too, but their husbands possibly did not acquire with their wives the chivalrous sense of duty which possessed the breast of every member, male and female, of the B. family, and inspired them with a wish to do justice when fortune permitted.

It would be infinitely agreeable to collect and peruse the letters and records of consultations which passed or took place between the members of this family on the subject of the £600. These documents would form the materials of one of the most delightful romances in the world—the romance of honour, which never dies in some families, but is transmitted from generation to generation like a treasure above all price. When this brief notice is read in Charleston, it may possibly lead to the collection of these materials, which, with the proper names of all the persons engaged, should, we think, be laid before the world as a pleasing record of hereditary nobility of sentiment.

After the lapse of many years, a widow and her three nephews found themselves in possession of the

* *Baronial and Ecclesiastical Antiquities of Scotland.* By William Burn and W. Billings. 4 vols. 4to. Blackwoods, Edinburgh.

necessary means for paying the family debt. Three-quarters of a century had elapsed. The children and the children's children of the original borrower had passed away; but the honour of the B. family had been transmitted intact to the fourth generation, and a search was immediately commenced to discover the creditors in England. This, however, as may well be supposed, was no easy task. The members of the S. family had multiplied and separated, married and intermarried, become poor and wealthy, distinguished and obscure by turns, changed their topographical as well as their social position, and disappeared entirely from the spot they had occupied on their first arrival from America.

But honour is indefatigable, and by degrees a letter reached a person in Kensington, who happened to possess some knowledge of a lady of the S. family, married to a solicitor practising with great success and distinction in London. When the letter came to hand, she at first doubted whether it might not be a sort of grave hoax, intended to excite expectation for the pleasure of witnessing its disappointment. However, the English solicitor, accustomed to the incidents of life, thought there would at least be no harm in replying to the letter from Charleston, and discovering in this way the real state of the affair.

Some delay necessarily occurred, especially as the B. family in America were old world sort of people, accustomed to transact business slowly and methodically, and with due attention to the minutest points. But at length a reply came, in which the writer observed, that if a deed of release were drawn up, signed by all the parties concerned in England, and transmitted to America, the L.600 should immediately be forwarded for distribution among the members of the S. family. Some demur now arose. Some of the persons concerned growing prudent as the chances of recovering the money appeared to multiply, thought it would be wrong to send the deed of release before the money had been received. But the solicitor had not learned, in the practice of his profession, to form so low an estimate of human nature. He considered confidence in this case to be synonymous with prudence, and at any rate resolved to take upon himself the entire responsibility of complying with the wishes of the Americans. He accordingly drew up the necessary document, got it signed by as many as participated in his views, and sent it across the Atlantic, without the slightest doubt or hesitation. There had been something in the rough, blunt honesty of Mr B——'s letter that inspired in the man of law the utmost reliance on his faith, though during the interval which elapsed between the transmission of the deed and the reception of an answer from the States, several of his friends exhibited a disposition to make themselves merry at the expense of his chivalry. But when we consider all the particulars of the case, we can hardly fail to perceive that he ran no risk whatever; for even if the debt had not legally lapsed, the people who had retained it in their memory through three generations—who had from father to son practised strict economy in order to relieve themselves from the burden—who had, with much difficulty and some expense, sought out the heirs of their creditor in a distant country, could scarcely be suspected of any inclination to finish off with a fraud at last.

Still, if there was honour on one side, there was enlarged confidence on the other; and in the course of a few months, the American mail brought to London the famous L.600 due since before the War of Independence. The business now was to divide and distribute it. Of course, each of the creditors was loud in expressions of admiration of the honour of the B. family, whose representative, while forwarding the money, asked with much simplicity to have a few old English newspapers sent out to him by way of acknowledgment. For his own part, however, he experienced a strong desire to behold some of the persons to whom

he had thus paid a debt of the last century; and he gave a warm and pressing invitation to any of them, to come out and stay as long as they thought proper at his house in Charleston. Had the invitation been accepted, we cannot doubt that Brother Jonathan would have acted as hospitably in the character of host as he behaved honourably in that of debtor. It would have been a pleasure, we might indeed say a distinction, to live under the same roof with such a man, whose very name carries us back to the primitive times of the colony, when Charleston was a city of the British Empire, and English laws, manners, habits, and feelings regulated the proceedings and relations of its inhabitants. It is to be hoped, therefore, that the London solicitor will some day drop in quietly upon his friend in Charleston, to smoke a cigar, and discuss old times with him. He will in that case probably fancy himself chatting with a contemporary of Rip Van Winkle. Doubtless there are thousands of such men in the States, where frequently everything that is estimable in the English character is cultivated with assiduity.

How the property was distributed among the S. family in England, we need not say. Each surviving individual had his or her share. The solicitor was only connected with them by marriage; but with good old English ideas of uprightness and integrity, he was fully able to appreciate the Charleston lawyer's sentiments. He would have done exactly the same himself under similar circumstances; and therefore, had the sum been tens of thousands instead of hundreds, it could not be said to have fallen into bad hands. Whether the transaction above noticed has led or not to a continued correspondence between the families, we are unable to say; but we think the creditors in England would naturally have felt a pleasure in exchanging intelligence from time to time with their worthy debtors in Charleston. These things, however, are private, and therefore we do not intend to trench upon them.

THE PARLOUR AQUARIUM.

It is not many years since Mr Ward first drew the attention of botanists to the cultivation of plants in closely-glazed cases; but the most sanguine dreams of the discoverer could not then have foretold the many useful purposes to which the Wardian Case has become applicable, nor the important influence which it was destined to obtain in promoting the pleasant pursuits of gardening and botany. The Wardian Case has been instrumental in diffusing a love of these pursuits among all classes of society. It has opened up to those whose pursuits confine them within the limits of the city's smoke-cloud, a means whereby they may obtain 'a peep at nature, if they can no more.' Far removed from green fields and leafy woods, they may, for instance, enjoy their leisure mornings in watching one of the most beautiful phenomena of vegetable development—the evolution of the circinate fronds of the fern; a plant in every respect associated with elegance and beauty. This kind of gardening has, therefore, become of late years one of the most fashionable, while at the same time one of the most pleasant sources of domestic amusement.

An interesting companion to the Wardian Case has lately been presented in the Aquatic Plant Case, or Parlour Aquarium, due to the ingenuity of Mr Warrington, and which has for its object, as its name indicates, the cultivation of aquatic or water plants. It may be described as a combination of the Wardian Case and the gold-fish globe, the object being to illustrate the mutual dependence of animal and vegetable life. Mr Warrington has lately detailed his experiments. 'The small gold-fish were placed in a glass-receiver of about twelve gallons' capacity, having a cover of thin muslin stretched over a stout copper wire, bent into a

circle, placed over its mouth, so as to exclude as much as possible the sooty dust of the London atmosphere, without, at the same time, impeding the free passage of the atmospheric air. This receiver was about half-filled with ordinary spring-water, and supplied at the bottom with sand and mud, together with loose stones of limestone tufa from Matlock, and of sandstone: these were arranged so that the fish could get below. . . . A small plant of *Vallisneria spiralis* was introduced, its roots being inserted in the mud and sand, and covered by one of the loose stones, so as to retain the plant in its position. . . . The materials being thus arranged, all appeared to go on well for a short time, until circumstances occurred which indicated that another and very material agent was required to perfect the adjustment.' The decaying leaves of the *vallisneria* produced a slime which began to affect the fish injuriously: this it was necessary to get quit of. Mr Warrington introduced five or six snails (*Limnea stagnalis*), 'which soon removed the nuisance, and restored the fish to a healthy state; thus perfecting the balance between the animal and vegetable inhabitants, and enabling both to perform their functions with health and energy. So luxuriant was the growth of the *vallisneria* under these circumstances, that by the autumn the one solitary plant originally introduced had thrown out very numerous offshoots and suckers, thus multiplying to the extent of upwards of thirty-five strong plants, and these threw up their long spiral flower-stems in all directions, so that at one time more than forty blossoms were counted lying on the surface of the water. The fish have been lively, bright in colour, and appear very healthy; and the snails also—judging from the enormous quantities of gelatinous masses of eggs which they have deposited on all parts of the receiver, as well as on the fragments of stone—appear to thrive wonderfully, affording a large quantity of food to the fish in the form of the young snails, which are devoured as soon as they exhibit signs of vitality and locomotion, and before their shell has become hardened.'

In remarking upon the result of his experiments, Mr Warrington observes: 'Thus we have that admirable balance sustained between the animal and vegetable kingdoms, and that in a liquid element. The fish, in its respiration, consumes the oxygen held in solution by the water as atmospheric air, furnishes carbonic acid, feeds on the insects and young snails, and excretes material well adapted as a rich food to the plant, and well fitted for its luxuriant growth. The plant, by its respiration, consumes the carbonic acid produced by the fish, appropriating the carbon to the construction of its tissues and fibres, and liberates the oxygen in its gaseous state to sustain the healthy functions of the animal life; at the same time that it feeds on the rejected matter, which has fulfilled its purposes in the nourishment of the fish and snail, and preserves the water constantly in a clean and healthy condition. While the slimy snail, finding its proper nutriment in the decomposing vegetable matter and minute confervoid growth, prevents their accumulation by removing them; and by its vital powers converts what would otherwise act as a poison into a rich and fruitful nutriment, again to constitute a pabulum for the vegetable growth, while it also acts the important part of a purveyor to its finny neighbours.* This perfect adjustment in the economy of the animal and vegetable kingdoms, whereby the vital functions of each are permanently maintained, is one of the most beautiful phenomena of organic nature.

The Parlour Aquarium affords valuable, we might say invaluable, facilities to the naturalist in the prosecution of his researches. The botanist can now conveniently watch the development of aquatic plants under condi-

tions not unnatural, throughout the entire period of their existence, from their germination to the production of flowers and the perfection of seeds; and we are in hopes that much of the obscurity that invests many aquatic vegetables will in consequence be cleared up. The zoologist is perhaps even more indebted to the invention. The habits, not only of the fishes, but of the mollusca, can be accurately studied under natural conditions, and many important facts of their history ascertained and illustrated. The water-beetles and other aquatic insects will also come in for a share of attention.

In concluding his paper in the *Garden Companion* (l. p. 7), Mr Warrington states, that he is at present attempting a similar arrangement with a confined portion of sea-water, employing some of the green sea-weeds as the vegetable members of the circle, and the common winkle or whelk to represent the water-snails. In a Report of the Yorkshire Naturalist's Club, November 5, 1851,* we observe it stated, that Mr Charlesworth read an extract from a letter from a gentleman in America, detailing some successful experiments on keeping marine molluscs alive in sea-water for months; but our inquiries have not been successful in eliciting any further information on the subject.

Experiments of our own have led to the conclusion, that some families of aquatic plants are altogether unsuitable for the Parlour Aquarium—such as, potato-germ, chara, &c., which very soon communicate a putrescent odour to the water in which they are grown, rendering it highly disagreeable in a sitting-room.

A WEDDING DINNER.

THE English are often reproached with love of good cheer, and certainly if foreigners were to judge of us from the manner in which we celebrate our Christmas, we cannot wonder at their supposing 'biflik' to be necessary to our happiness. But high feasting has not in any age been confined to the English, and perhaps the following account, translated from an old chronicle, of a wedding-dinner given by the Milanese, in 1386, to our Duke of Clarence, son of Edward III., may prove not unamusing or unsuggestive.

Lionel of Antwerp, Duke of Clarence, was the widower of Elizabeth of Ulster, and his second wife, Zolante, was the sister of Giovanni Galeazzo Visconti, Duke of Milan. The latter nuptials were celebrated at Milan with great pomp. The most illustrious personages were invited from every part of Europe; tournaments, balls, and other diversions, occupied the guests, who were all furnished with splendid apartments, till the whole company being assembled, Giovanni Galeazzo conducted the newly-married couple from the church to his palace. In one immense hall were laid out a hundred tables for the most distinguished guests, including the mightiest princes in Italy, the most beautiful women, and the most celebrated characters of the age; among whom we must not omit to mention Francesco Petrarca. Other tables were placed in the adjoining apartments. Seneschals, in the most sumptuous dresses, brought in the massive dishes of gold and silver. The cup-bearers performed their duties on horseback, galloping round the hall and handing the choicest wines in costly vases of gold, silver, or crystal. This custom of servants waiting at table on horseback appears singular in our time, but it serves to give an idea of the splendour of other days and the enormous size of the apartments. It also tends to explain why most of the noble mansions still exist from the time of which we speak, instead of a stable-case, have a gradual ascent of bricks, generally leading to a hall of large dimensions. And frequently we

* Quarterly Journal of the Chemical Society, III. 52.

* Naturalist, vol. I. 239.

see evident tokens that flights of steps have been substituted in later times.

The banquet consisted of eighteen courses; and between each course presents of various kinds were offered to the bridegroom, or distributed by him; so that before the dinner had ended, Lionel had presented every individual around him with some article of value, besides 600 richly embroidered garments which he had given to the mimes and players engaged for the occasion.

Here follows a formal account of the dinner, but we must economise our space. The first course consisted of young pigs, gilded, with flames issuing from their mouths; the second, of hares and pike, likewise gilded; the third, of gilded veal and trout; the fourth, of partridges, quails, and fish, all gilded; the fifth, of ducks, small birds, and fish, all gilded; the sixth, of beef, capons with garlic-sauce, and sturgeon; the seventh, of veal and capons with lemon-sauce; the eighth, of beef-pies, with cheese and sugar, and eel-pies with sugar and spices; the ninth, of meats, fowl and fish in jelly (potted, we presume); the tenth, of gilded meats and lamprey; the eleventh, of roast kid, birds, and fish; the twelfth, of hares and venison, and fish with vinegar and sugar; the thirteenth, of beef and deer, with lemon and sugar; the fourteenth, of fowls, capons, and tench, covered with red and green foil; the fifteenth, of pigeons, small birds, beans, salt tongues, and carp; the sixteenth, of rabbits, peacocks, and eels roasted with lemon; the seventeenth, of sour milk and cheese; and the eighteenth, of fruits of the rarest and most expensive kinds.

At each of these courses the duke received a separate gift—beginning with a pair of *leopards*, with velvet collars and gilded buckles. Then followed numberless braces of pointers, greyhounds, setters, and falcons, all with trappings and ornaments of silk, gold, and pearls; dozens of breastplates, helmets, lances, shields, saddles, and complete suits of armour, enriched with silver, gold, and velvet; numerous pieces of cloth of gold and satin; horses by half-dozens, with saddles and trappings highly ornamented; twelve beautiful milk-white oxen; 'a vest and cowl embroidered with pearls, representing various flowers; a baronial mantle and cowl lined with ermine, and richly embroidered with pearls; a large ewer of massive silver, four waistbands of wrought silver (now called *filigrane*); a clump of diamonds and rubies, with a pearl of immense value in the centre; and a variety of specimens of the choicest wines and most elegant confectionary.'

In those times, there was little refinement of taste, and the culinary art was probably in its infancy. Hence we find the dishes in quality and number rather suited to satisfy the appetites of huntsmen than the delicate palate of a courtier of our day. Sugar and spices were used in profusion, perhaps because they were scarce and expensive, rather than on account of their flavour. Fowls were coloured red or green; while meat, and such other solid eatables as could only be boiled or roasted, were gilt all over. The expense of such an entertainment must have been immense; and when we add, that the value of most of the gifts was vastly greater than at present, and that, besides the presents to the bridegroom, Giovanni Galeazzo gave away 150 beautiful horses, and his kinsman, Bernabo, jewels and golden coins to a large amount, the whole sum disbursed on this occasion would appear so enormous as to make one doubt whether a petty sovereign could really afford such ostentatious prodigality. But when we consider that the flourishing state of the commerce of Italy attracted thither all the wealth of Europe, we are no longer surprised at an expenditure which, however great, might at that time have been borne not by a reigning duke of Milan or Florence alone, but even by many citizens of the various Italian republics.

During the repast, an innumerable crowd of jesters, mimes, and trick-players of all sorts, amused the

company with their gambols; and such was the noise produced by trumpets, drums, and other martial instruments, by the vociferation of the performers and the applause of the spectators, that no single voice could be heard; and a contemporary historian compares it to the wild roar of a tempestuous sea.

SAVINGS-BANKS IN RUSSIA.

UNTIL the year 1825, no kind of savings-bank existed in Russia. The farmers and peasants, residing for the most part in remote and scattered habitations, were accustomed to keep their little store of money in common earthen-pots buried in the ground, whence it was not unfrequently stolen. It also often happened that, owing to the sudden illness or death of the owner, the place of concealment was unknown to any one; thus the savings were lost, and much family trouble and difficulty arose. In March 1825, a truly patriotic young merchant, Frederick Hagedom, junior, of Libau, in Courland, perceived the advantage of savings-banks in other countries of Europe, and the disadvantages of the system pursued by his poor countrymen. He resolved, therefore, to institute a savings-bank in Libau. The patronage of the governor-general was obtained, and one of the magistrates of the town appointed superintendent: Frederick Hagedom and two other gentlemen were chosen directors. The public of the town soon testified their approbation of the good work, by bringing in their silver rubles and copper kopecks at the appointed hours—namely, from five to seven every Saturday evening, and at two periods of the year daily—from the 1st to the 12th of June and December. The peasants, however, did not display the same alacrity and confidence as indeed was to be expected. Their kind benefactor perceiving this, wrote and circulated a short pamphlet in the Lettish language of the country, explaining the intention, object, and advantages of the new savings-bank. This convinced the ignorant country-people that their old way of keeping their money, even if safe, was not profitable. The pastors of the village churches also took occasion to speak to their people on the subject, being persuaded, like the benevolent founders of the savings-bank, that it was a plan which could not fail to improve the moral and religious character of the peasantry. These exertions did not fail to produce the desired effect.

To accommodate the country-people who came from a distance, it was soon found advisable to open the savings-bank for their attendance daily from twelve to one—the Saturday evenings being reserved for the inhabitants of the town. All classes now became desirous of taking advantage of the savings-bank, and brought in silver rubles and kopecks, instead of keeping them hoarded and useless.

A sum under five rubles receives no interest—is merely saved and kept—which is, however, no slight benefit to the poor peasant. Above that sum, 4 per cent. interest is paid. The owner is at liberty to withdraw the principal at will. The tables published in 1845, after twenty years' existence, afford a most satisfactory and interesting result. The increase of members who partake of the benefits has steadily advanced. One-third of the number are inhabitants of Libau, the remainder are from the country. A very important gain was also perceived to arise from the system: a large portion of the silver rubles and Albert-dollars paid in, had evidently been for many years kept entirely out of circulation, buried in pots in the earth, and consequently in such a condition, that it was often necessary to have the coin carefully cleaned, before it was fit to be sent out into circulation again. Besides the pecuniary advantage, the improvement in the character of the people has been remarkable. The savings-bank has strengthened in a singular degree the love of order, industry, and temperance. How many

cheerful hopes and anticipations are connected with savings! It has been ascertained, both in England and France, that since the establishment of savings-banks in those countries, no criminal has ever been found to have been a member of one. How true a benefactor to his country has the young merchant Hagedorn proved himself to be! May he live long to direct the savings-bank of his native town of Libau! And, to conclude with the words of the last report of the institution: 'May a gracious Providence continue to prosper this first and oldest institution of the kind in the empire of Russia, and preserve this institution, so highly beneficial to the economical and moral state of the people, in its full prosperity, to future generations!''*

CALORIC SHIPS.

The idea of substituting a new and superior motive-power for steam will no doubt strike many minds as extravagant, if not chimerical. We have been so accustomed to regard steam-power as the *ne plus ultra* of attainment in subjecting the modified forces of nature to the service of man, that a discovery which promises to supersede this agency will have to contend with the most formidable preconceptions as well as with gigantic interests. Nevertheless, it may now be predicted with confidence, that we are on the eve of another great revolution, produced by the application of an agent more economical and incalculably safer than steam. A few years hence we shall hear of the 'wonders of caloric' instead of the 'wonders of steam.' To the question: 'How did you cross the Atlantic?' the reply will be: 'By caloric of course!' On Saturday, I visited the manufactory, and had the privilege of inspecting Ericsson's caloric engine of 60 horse-power, while it was in operation. It consists of two pairs of cylinders, the working pistons of which are 72 inches in diameter. Its great peculiarities consist in its very large cylinders and pistons, working with very low pressure, and in the absence of boilers or heaters, there being no other fires employed than those in small grates under the bottoms of the working cylinders. During the eight months that this test-engine has been in operation, not a cent has been expended for repairs or accidents. The leading principle of the caloric engine consists in producing motive-power by the employment of the expansive force of atmospheric air instead of that of steam; the force being produced by compression of the air in one part of the machine, and by its dilatation by the application of heat in another part. This dilatation, however, is not effected by continuous application of combustibles, but by a peculiar process of transfer, by which the caloric is made to operate over and over again—namely, the heat of the air escaping from the working cylinder at each successive stroke of the engine, is transferred to the cold compressed air, entering the same; so that, in fact, a continued application of fuel is only necessary in order to make good the losses of heat occasioned by the unavoidable eradication of the heated parts of the machine. The obvious advantages of this great improvement are the great saving of fuel and labour in the management of the engine, and its perfect safety. A ship carrying the amount of coal that the Atlantic steamers now take for a single trip, could cross and recross the Atlantic twice without taking in coal; and the voyage to China or to California could be easily accomplished by a caloric ship without the necessity of stopping at any port to take in fuel. Anthracite coal being far the best fuel for this new engine, we shall no longer have to purchase bituminous coal in England for return-trips. On the contrary, England will find it advantageous to come to us for our anthracite. A slow radiating fire without flame is what is required, and this is best supplied by our anthracite. The *Ericsson* will be ready for sea by October next, and her owners intend to take passengers at a reduced price, in consequence of the reduced expenses under the new principle.—*Boston Transcript*.

* Communicated by a lady, as translated from a pamphlet published in Russia.

VIOLETS:

SENT IN A TINY BOX.

Let them lie—ah, let them lie!
Plucked flowers—dead to-morrow;
Lift the lid up quietly,
As you'd lift the mystery
Of a buried sorrow.

Let them lie—the fragrant things,
All their souls thus giving;
Let no breeze's ambient wings
And no useless water-springs
Mock them into living.

They have lived—they live no more;
Nothing can requite them
For the gentle life they bore,
And up-yielded in full store
While it did delight them.

Yet, I ween, flower-corses fair!
'Twas a joyful yielding,
Like some soul heroic, rare,
That leaps bodiless forth in air
For its loved one's shielding.

Surely, ye were glad to die
In the hand that slew ye,
Glad to leave the open sky,
And the airs that wandered by,
And the bees that knew ye;

Giving up a small earth-place
And a day of blooming,
Here to lie in narrow space,
Smiling in this smileless face
With such sweet perfuming.

O ye little violets dead!
Coffined from all gazes,
We will also smile, and shed
Out of heart-flowers withered
Perfume of sweet praises.

And as ye, for this poor sake,
Love with life are buying,
So, I doubt not, ONE will make
All our gathered flowers to take
Richer scent through dying.

CHINESE LAUNDRY IN CALIFORNIA.

What a truly industrious people they are! At work, cheerfully and briskly, at ten o'clock at night. Huge piles of linen and under-clothing disposed in baskets about the room, near the different ironers. Those at work dampening and ironing—peculiar processes both. A bowl of water is standing at the ironer's side, as in ordinary laundries, but used very differently. Instead of dipping the fingers in the water, and then snapping them over the clothes, the operator puts his head in the bowl, fills his mouth with water, and then blows so that the water comes from his mouth in a mist, resembling the emission of steam from an escape-pipe, at the same time so directing his head that the mist is scattered all over the piece he is about to iron. He then seizes his flat iron. This invention beats the 'Yankees' all to bits. It is a vessel resembling a small, deep, metallic wash-basin, having a highly-polished flat bottom, and a fire continually burning in it. Thus they keep the iron hot, without running to the fire every five minutes and spitting on the iron to ascertain by the 'sizzle' if it be ready to use. This ironing machine has a long handle, and is propelled without danger of burning the fingers by the slipping of the 'ironing rag.' Ladies who use the ordinary flat irons will appreciate the improvement.—*Marysville (California) Herald*.

WOLF-CHILDREN.

It is a pity that the present age is so completely absorbed in materialities, at a time when the facilities are so singularly great for a philosophy which would inquire into the constitution of our moral nature. In the North Pacific, we are in contact with tribes of savages ripening, sensibly to the eye, into civilised communities; and we are able to watch the change as dispassionately as if we were in our studies examining the wonders of the minute creation through a microscope. In America, we have before us a living model, blind, mute, deaf, and without the sense of smell; communicating with the external world by the sense of touch alone; yet endowed with a rare intelligence, which permits us to see, through the fourfold veil that shrouds her, the original germs of the human character.* Nearer home, we have been from time to time attracted and astonished by the spectacle of children, born of European parents, emerging from forests where they had been lost for a series of years, fallen back, not into the moral condition of savages, but of wild beasts, with the sentiments and even the instincts of their kind obliterated for ever. And now we have several cases before us, occurring in India, of the same lapses from humanity, involving circumstances curious in themselves, but more important than curious, as throwing a strange light upon what before was an impenetrable mystery. It is to these we mean to direct our attention on the present occasion; but before doing so, it will be well just to glance at the natural history of the wild children of Europe.†

The most remarkable specimen, and the best type of the class, was found in the year 1725, in a wood in Hanover. With the appearance of a human being—of a boy about thirteen years of age—he was in every respect a wild animal, walking on all-fours, feeding on grass and moss, and lodging in trees. When captured, he exhibited a strong repugnance to clothing; he could not be induced to lie on a bed, frequently tearing the clothes to express his indignation; and in the absence of his customary lair among the boughs of a tree, he crouched in a corner of the room to sleep. Raw food he devoured with relish, more especially cabbage-leaves and other vegetables, but turned away from the sophistications of cookery. He had no articulate language, expressing his emotions only by the sounds emitted by various animals. Although only five feet three inches, he was remarkably

strong; he never exhibited any interest in the female sex; and even in his old age—for he was supposed to be seventy-three when he died—it was only in external manners he had advanced from the character of a wild beast to that of a good-tempered savage, for he was still without consciousness of the Great Spirit.

In other children that were caught subsequently to Peter, for that was the name they gave him, the same character was observable, although with considerable modifications. One of them, a young girl of twelve or thirteen, was not merely without sympathy for persons of the male sex, but she held them all her life in great abhorrence. Her temper was ungovernable; she was fond of blood, which she sucked from the living animal; and was something more than suspected of the cannibal propensity. On one occasion, she was seen to dive as naturally as an otter in a lake, catch a fish, and devour it on the spot. Yet this girl eventually acquired language; was even able to give some indistinct account of her early career in the woods; and towards the close of her life, when subdued by long illness, exhibited few traces of having once been a wild animal. Another, a boy of eleven or twelve, was caught in the woods of Canne, in France. He was impatient, capricious, violent; rushing even through crowded streets like an ill-trained dog; slovenly and disgusting in his manners; affected with spasmodic motions of the head and limbs; biting and scratching all who displeased him; and always, when at comparative rest, balancing his body like a wild animal in a menagerie. His senses were incapable of being affected by anything not appealing to his personal feelings: a pistol fired close to his head excited little or no emotion, yet he heard distinctly the cracking of a walnut, or the touch of a hand upon the key which kept him captive. The most delicious perfumes, or the most fetid exhalations, were the same thing to his sense of smell, because these did not affect, one way or other, his relish for his food, which was of a disgusting nature, and which he dragged about the floor like a dog, eating it when besmeared with filth. Like almost all the lower animals, he was affected by the changes of the weather; but on some of these occasions, his feelings approached to the human in their manifestations. When he saw the sun break suddenly from a cloud, he expressed his joy by bursting into convulsive peals of laughter; and one morning, when he awoke, on seeing the ground covered with snow, he leaped out of bed, rushed naked into the garden, rolled himself over and over in the snow, and stuffing handfuls of it into his mouth, devoured it eagerly. Sometimes he shewed signs of a true madness, wringing his hands, gnashing his teeth, and becoming formidable to those about him. But in other moods, the phenomena

* See 'The Rudimental,' in No. 391.

† A paper on this subject will be found in *Chambers's Miscellany of Useful and Entertaining Tracts*, vol. v. No. 48.

of nature seemed to tranquillise and sadden him. When the severity of the season, as we are informed by the French physician who had charge of him, had driven every other person out of the garden, he still delighted to walk there; and after taking many turns, would seat himself beside a pond of water. Here his convulsive motions, and the continual balancing of his whole body, diminished, and gave way to a more tranquil attitude; his face gradually assumed the character of sorrow or melancholy reverie, while his eyes were steadfastly fixed on the surface of the water, and he threw into it, from time to time, some withered leaves. In like manner, on a moonlight night, when the rays of the moon entered his room, he seldom failed to awake, and to place himself at the window. Here he would remain for a considerable time, motionless, with his neck extended, and his eyes fixed on the moonlight landscape, and wrapped in a kind of contemplative ecstasy, the silence of which was interrupted only by profound inspirations, accompanied by a slight plaintive noise.

We have only to add, that by the anxious care of the physician, and a thousand ingenious contrivances, the senses of this human animal, with the exception of his hearing, which always remained dull and impassive, were gradually stimulated, and he was even able at length to pronounce two or three words. Here his history breaks off.

The scene of these extraordinary narratives has hitherto been confined to Europe; but we have now to draw attention to the wild children of India. It happens, fortunately, that in this case the character of the testimony is unimpeachable; for although brought forward in a brief, rough pamphlet, published in a provincial town, and merely said to be 'by an Indian Official,' we recognise both in the manner and matter the pen of Colonel Sleeman, the British Resident at the court of Lucknow, whose invaluable services in putting down thuggee and dacoitee in India we have already described to our readers.*

The district of Sultanpoor, in the kingdom of Oude, a portion of the great plain of the Ganges, is watered by the Goomtee River, a navigable stream, about 140 yards broad, the banks of which are much infested by wolves. These animals are protected by the superstition of the Hindoos, and to such an extent, that a village community within whose boundaries a single drop of their blood has been shed, is believed to be doomed to destruction. The wolf is safe—but from a very different reason—even from those vagrant tribes who have no permanent abiding-place, but bivouac in the jungle, and feed upon jackals, reptiles—anything, and who make a trade of catching and selling such wild animals as they consider too valuable to eat. The reason why the vulpine ravager is spared by these wretches is—that *wolves devour children!* Not, however, that the wanderers have any dislike to children, but they are tempted by the jewels with which they are adorned; and knowing the dens of the animals, they make this fearful gold-seeking a part of their business. The adornment of their persons with jewellery is a passion with the Hindoos which nothing can overcome. Vast numbers of women—even those of the most infamous class—are murdered for the sake of their ornaments, yet the lesson is lost upon the survivors. Vast numbers of children, too, fall victims in the same way, and from the same cause, or are permitted, by those who shrink from murder, to be carried off and devoured by the wolves; yet no Indian mother can withstand the temptation to bedizen her child, whenever it is in her power, with bracelets, necklaces, and other ornaments of gold and

silver. So much is necessary as an introduction to the incidents that follow.

One day, a trooper, like Spenser's gentle knight, 'was pricking on the plain,' near the banks of the Goomtee. He was within a short distance of Chandour, a village about ten miles from Sultanpoor, the capital of the district, when he halted to observe a large female wolf and her whelps come out of a wood near the roadside, and go down to the river to drink. There were four whelps. Four!—surely not more than three; for the fourth of the juvenile company was as little like a wolf as possible. The horseman stared; for in fact it was a boy, going on all-fours like his comrades, evidently on excellent terms with them all, and guarded, as well as the rest, by the dam with the same jealous care which that exemplary mother, but unpleasant neighbour, bestows upon her progeny. The trooper sat still in his saddle watching this curious company till they had satisfied their thirst; but as soon as they commenced their return, he put spurs to his horse, to intercept the boy. Off ran the wolves, and off ran the boy belterskelter—the latter keeping close up with the dam; and the horseman, owing to the unevenness of the ground, found it impossible to overtake them before they had all entered their den. He was determined, nevertheless, to attain his object, and assembling some people from the neighbouring village with pickaxes, they began to dig in the usual way into the hole. Having made an excavation of six or eight feet, the garrison evacuated the place—the wolf, the three whelps, and the boy, leaping suddenly out and taking to flight. The trooper instantly threw himself upon his horse, and set off in pursuit, followed by the fleetest of the party; and the ground over which they had to fly being this time more even, he at length headed the chase, and turned the whole back upon the men on foot. These secured the boy, and, according to prescriptive rule, allowed the wolf and her three whelps to go on their way.

'They took the boy to the village,' says Colonel Sleeman, 'but had to tie him, for he was very restive, and struggled hard to rush into every hole or den they came near. They tried to make him speak, but could get nothing from him but an angry growl or snarl. He was kept for several days at the village, and a large crowd assembled every day to see him. When a grown-up person came near him, he became alarmed, and tried to steal away; but when a child came near him, he rushed at it with a fierce snarl, like that of a dog, and tried to bite it. When any cooked meat was put near him, he rejected it in disgust; but when raw meat was offered, he seized it with avidity, put it upon the ground, under his hands, like a dog, and ate it with evident pleasure. He would not let any one come near while he was eating, but he made no objection to a dog's coming and sharing his food with him.'

This wild boy was sent to Captain Nicholetts, the European officer commanding the 1st regiment of Oude Local Infantry, stationed at Sultanpoor. He lived only three years after his capture, and died in August 1850. According to Captain Nicholetts' account of him, he was very inoffensive except when teased, and would then growl and snarl. He came to eat anything that was thrown to him, although much preferring raw flesh. He was very fond of uncooked bones, masticating them apparently with as much ease as meat; and he had likewise a still more curious partiality for small stones and earth. So great was his appetite, that he has been known to eat half a lamb at one meal; and buttermilk he would drink by the pitcher full without seeming to draw breath. He would never submit to wear any article of dress even in the coldest weather; and when a quilt stuffed with cotton was given to him, 'he tore it to pieces, and ate a portion of it—cotton and all—with his bread every day.' The countenance of the boy was repulsive, and his habits filthy in the extreme. He was never known to smile; and although fond of dogs and jackals,

* See 'Gang-Robbers of India,' in Nos. 300 and 361 of this Journal. The title of the pamphlet alluded to is, *An Account of Wolves nurturing Children in their Dens.* By an Indian Official. Plymouth: Jenkin Thomas, printer. 1852.

formed no attachment for any human being. Even when a favourite pariah dog, which used to feed with him, was shot for having fallen under suspicion of taking the lion's share of the meal, he appeared to be quite indifferent. He sometimes walked erect; but generally ran on all-fours—more especially to his food when it was placed at a distance from him.

Another of these wolf-children was carried off from his parents at Chupra (twenty miles from Sultanpoor), when he was three years of age. They were at work in the field, the man cutting his crop of wheat and pulse, and the woman gleaning after him, with the child sitting on the grass. Suddenly, there rushed into the family party, from behind a bush, a gaunt wolf, and seizing the boy by the loins, ran off with him to a neighbouring ravine. The mother followed with loud screams, which brought the whole village to her assistance; but they soon lost sight of the wolf and his prey, and the boy was heard no more of for six years. At the end of that time, he was found by two sipahis associating, as in the former case, with wolves, and caught by the leg when he had got half-way into the den. He was very ferocious when drawn out, biting at his deliverers, and seizing hold of the barrel of one of their guns with his teeth. They secured him, however, and carried him home, when they fed him on raw flesh, hare, and birds, till they found the charge too onerous, and gave him up to the public charity of the village till he should be recognised by his parents. This actually came to pass. His mother, by that time a widow, hearing a report of the strange boy at Koeleapoor, hastened to the place from her own village of Chupra, and by means of indubitable marks upon his person, recognised her child, transformed into a wild animal. She carried him home with her; but finding him destitute of natural affection, and in other respects wholly irreclaimable, at the end of two months she left him to the common charity of the village.

When this boy drank, he dipped his face in the water, and sucked. The front of his elbows and knees had become hardened from going on all-fours with the wolves. The village boys amused themselves by throwing frogs to him, which he caught and devoured; and when a bullock died and was skinned, he resorted to the carcass like the dogs of the place, and fed upon the carrion. His body smelled offensively. He remained in the village during the day, for the sake of what he could get to eat, but always went off to the jungle at night. In other particulars, his habits resembled those already described. We have only to add respecting him, that, in November 1850, he was sent from Sultanpoor, under the charge of his mother, to Colonel Sleeman—then probably at Lucknow—but something alarming him on the way, he ran into a jungle, and had not been recovered at the date of the last dispatch.

We pass over three other narratives of a similar kind, that present nothing peculiar, and shall conclude with one more specimen of the Indian wolf-boy. This human animal was captured, like the first we have described, by a trooper, with the assistance of another person on foot. When placed on the pommel of the saddle, he tore the horseman's clothes, and, although his hands were tied, contrived to bite him severely in several places. He was taken to Bondce, where the rajah took charge of him till he was carried off by Janoo, a lad who was khidmutgar (table-attendant) to a travelling Cashmere merchant. The boy was then apparently about twelve years of age, and went upon all-fours, although he could stand, and go awkwardly on his legs when threatened. Under Janoo's attention, however, in beating and rubbing his legs with oil, he learned to walk like other human beings. But the vulpine smell continued to be very offensive, although his body was rubbed for some months with mustard-seed soaked in water, and he was compelled

during the discipline to live on rice, pulse, and bread. He slept under the mango-tree, where Janoo himself lodged, but was always tied to a tent-pin.

One night, when the wild boy was lying asleep under his tree, Janoo saw two wolves come up stealthily, and smell at him. They touched him, and he awoke; and rising from his reclining posture, he put his hands upon the heads of his visitors, and they licked his face. They capered round him, and he threw straw and leaves at them. The khidmutgar gave up his protégé for lost; but presently he became convinced that they were only at play, and he kept quiet. He at length gained confidence enough to drive the wolves away; but they soon came back, and resumed their sport for a time. The next night, three playfellows made their appearance, and in a few nights after, four. They came four or five times, till Janoo lost all his fear of them. When the Cashmere merchant returned to Lucknow, where his establishment was, Janoo still carried his pet with him, tied by a string to his own arm; and, to make him useful according to his capacity, with a bundle on his head. At every jungle they passed, however, the boy would throw down the bundle, and attempt to dart into the thicket; repeating the insubordination, though repeatedly beaten for it, till he was fairly subdued, and became docile by degrees. The greatest difficulty was to get him to wear clothes, which to the last he often injured or destroyed, by rubbing them against posts like a beast, when some part of his body itched. Some months after their arrival at Lucknow, Janoo was sent away from the place for a day or two on some business, and on his return he found that the wild boy had escaped. He was never more seen.

It is a curious circumstance, that the wild children, whether of Europe or Asia, have never been found above a certain age. They do not grow into adults in the woods. Colonel Sleeman thinks their lives may be cut short by their living exclusively on animal food; but to some of them, as we have seen, a vegetable diet has been habitual. The probability seems to be, that with increasing years, their added boldness and consciousness of strength may lead them into fatal adventures with their brethren of the forest. As for the protection of the animal by which they were originally nurtured becoming powerless from age, which is another hypothesis, that supposes too romantic a system of patronage and dependence. The head of the family must have several successive series of descendants to care for after the arrival of the stranger, and it is far more probable that the wild boy is obliged to turn out with his playmates, when they are ordered to shift for themselves, than that he alone remains a fixture at home. That protection of some kind at first is a necessary condition of his surviving at all, there can be no manner of doubt, although it does not follow that a wolf is always the patron. The different habits of some of the European children we have mentioned, shew a totally different course of education. If, for instance, they had been nurtured by wolves, they would no more have learned to climb trees than to fly in the air. As for the female specimen we have mentioned, hers was obviously an exceptional case. She was lost, as appeared from her own statement, when old enough to work at some employment, and a club she used as a weapon was one of her earliest recollections.

The wild children of India, however, were obviously indebted to wolves for their miserable lives; and it is not so difficult as at first sight might be supposed, to imagine the possibility of such an occurrence. The parent wolves are so careful of their progeny, that they feed them for some time with half-digested food, disgorged by themselves; and after that—if we may believe Buffon, who seems as familiar with the interior of a den as if he had boarded and lodged in the family—they bring home to them live animals, such as hares and rabbits. These the young wolves play with, and

when at length they are hungry, kill: the mother then for the first time interfering, to divide the prey in equal portions. But in the case of a child being brought to the den—a child accustomed, in all probability, to tyrannise over the whelps of pariah dogs and other young animals, they would find it far easier to play than to kill; and if we only suppose the whole family going to sleep together, and the parents bringing home fresh food in the morning—contingencies not highly improbable—the mystery is solved, although the marvel remains. It may be added, that such wolves as we have an opportunity of observing in menageries, are always gentle and playful when young, and it is only time that develops the latent ferocity of a character the most detestable, perhaps, in the whole animal kingdom. Cowardly and cruel in equal proportion, the wolf has no defenders. 'In short,' says Goldsmith—probably translating Buffon, for we have not the latter at hand to ascertain—'every way offensive, a savage aspect, a frightful howl, an insupportable odour, a perverse disposition, fierce habits, he is hateful while living, and useless when dead.'

But what, then, is man, whom mere accidental association for a few years can strip of the faculties inherent in his race and convert into a wolf? The lower animals retain their instincts in all circumstances. The kitten, brought up from birth on its mistress's lap, imbibes none of her tastes in food or anything else. It rejects vegetables, sweets, fruits, all drinks but water or milk, and although content to satisfy its hunger with dressed meat, darts with an eager growl upon raw flesh. Man alone is the creature of imitation in good or in bad. His faculties and instincts, although containing the germ of everything noble, are not independent and self-existing like those of the brutes. This fact accounts for the difference observable, in an almost stereotyped form, in the different classes of society; it affords a hint to legislators touching their obligation to use the power they possess in elevating, by means of education, the character of the more degraded portions of the community; and it brings home to us all the great lesson of sympathy for the bad as well as the afflicted—both victims alike of *circumstances*, over which they in many cases have nearly as little control as the wild children of the desert.

THE LITERATURE OF PARLIAMENT.

THE Imperial Parliament of Great Britain and Ireland, in addition to its other varied and important functions, fulfils, through one of its branches, that of a great national book manufactory. Every session, the House of Commons issues a whole library of valuable works, containing information of the most ample and searching kind on subjects of a very miscellaneous character. These are the Blue-books, of which everybody has heard: many jokes are extant as to their imposing bulk and great weight, literally and figuratively; and a generation eminently addicted to light reading, may well look with horror on these thick and closely-printed folios. But, in truth, they are not for the mere reader: they are for the historian, and student of any given subject; they are storehouses of material, not digested treatises. True it is, that their great size sometimes defeats its object—the valuable portion of the material is sometimes buried under the comparatively worthless heap that surrounds it—the golden grains lost amid the chaff. But in a case of this kind, the error of redundancy is on the safe side; let a subject in all its bearings be thoroughly and fully brought up, and it is the fault or failing of him who sets about the study of it, if he is appalled at the amount of information on which he has to work, or cannot discriminate and seize upon the salient points, or on those which are necessary for his own special purposes.

Few persons, we believe, who have not had occasion to consult these parliamentary volumes in a systematic manner, are at all aware of the immense labour that is bestowed upon them, and the care and completeness with which they are compiled and arranged. Indeed, we daresay few readers have any accurate notions of the actual number of parliamentary papers annually issued, or of the nature of their contents. From even a very cursory examination of the literary result of a parliamentary session, the previously uninformed investigator could not fail to rise with a greatly augmented estimate of the functions of the great ruling body of the state—the guarding and directing power in the multitudinous affairs of the British Empire—an empire that extends over every possible variety of country and climate, and includes under its powerful, yet mild and beneficent sway, tribes of every colour of skin, and of every shade of religious belief. Such a survey, in fact, tends to impress one more fully and immediately than could well be fancied, with the magnitude of the business of the British legislature, and the consequent weighty responsibilities imposed upon its members. But, great as the burden is, it is distributed over so many shoulders, that it appears to press heavily, and really does so, only on a few who support it at the more trying points.

The session 1851 is the latest of whose labours, as they appear in the form of parliamentary records, an account can be given. By the admirable system of arrangement we have referred to, each parliamentary 'paper,' whether it issues in the shape of a bulky Blue-book—that is to say, as a thick, stitched folio volume, in a dark-blue cover—or as a mere 'paper'—an uncovered folio of a single sheet of two or four pages, or several stitched together, but not attaining the dignity of the blue cover—is marked as belonging to a certain class; and when the issue of the session is complete, a full set of 'Titles, Contents, and Indexes' to the whole is supplied, so that they can all be classified and bound up in due order with the utmost ease and celerity. The *Titles, Contents, and Indexes to the Sessional Printed Papers of Session 1851* are at present before us, in the shape of a folio Blue-book about an inch and a half thick, from which we think we may pick some facts of interest.

It must be premised, that the session 1851 was considered by politicians a peculiarly barren and unfruitful one, as the Great Exhibition, in conjunction with ministerial difficulties, and the monster debates on the Ecclesiastical Titles' Bill, tended greatly to impede the ordinary business of the Houses, and gave an air of tedium and languor to the whole proceedings. Nevertheless, the papers for the year amount to no less than sixty volumes! Of these, the first six contain Public Bills. A bill, as most of our readers must be aware, is a measure submitted to the consideration of parliament with the view of its being adopted into the legal code of the country, for which it must receive the sanction of both Houses and the assent of the crown. When a bill has 'passed' through the Lords and Commons, and received the royal assent, it becomes an 'act'—that is, a law. A bill, in passing through the Houses, is subjected to numerous amendments and alterations in form, and is often printed, for the use of members and other parties interested, three or four times after such alterations, before it comes forth in its final and permanent form as an act. Thus, the famous Ecclesiastical Titles' Bill is to be found in three several shapes among the bills before it reappears for the fourth time as an act. Again, the word 'public' prefixed to these six volumes of bills, reminds us of the vast amount of business that comes before parliament and its committees in the shape of 'private' bills, of which no record appears here. These are bills of special and individual application, such as when a public company seeks an act of incorporation, the possessor of an entailed estate

desires to sell a portion of ground, a railway directory asks for powers of various kinds, and so on.

An examination of the contents of these six volumes would shew how many and diverse are the subjects that turn up in parliament in the course of a single and brief session; but to enter on it satisfactorily would require a great amount of space, and might, after all, be more tedious than profitable. A glance at those actually passed may suffice. These were 106 in number: the first is, 'An Act to amend the Passengers' Act of 1849;' and the hundred and sixth, 'An Act to appoint Commissioners to inquire into the Existence of Bribery in St Albans.' Besides the acts of an ordinary or routine character, we find the following among the subjects legislated on:—The Marine Forces, Leases for Mills in Ireland, Protection of Original Designs, the Protection of Servants and Apprentices, the Sale of Arsenic, Highways in Wales, Sites for Schools, Herring-Fishery, Prisons in Scotland, Common Lodging-Houses, Window and House Duties, Marriages in India, Ecclesiastical Titles, Smithfield Market, Settlement of the Boundaries of Canada and New Brunswick, Highland Roads and Bridges, Gunpowder Magazine at Liverpool, Management of the Insane in India, Lands in New Zealand, Representative Peers of Scotland, Emigration, Law of Evidence, Criminal Justice, &c.

Following the six volumes of bills, are fifteen volumes of *Reports from Committees*, which are again succeeded by nine volumes of *Reports from Commissioners*. These two sections of the literature of parliament form vast stores of material on an immense number of subjects, into which he who digs laboriously is sure to be rewarded in the end. They contain great masses of 'evidence,' extracted by the examinations of committees and commissioners from the parties believed to be best qualified to give correct and full information on the various subjects on which they are examined, and these opinions are supported by facts and authentic statements and statistics, invaluable to the investigator. The first volume of last year's Reports from Committees opens with that on the Edinburgh Annuity Tax, the fifteenth contains that on Steam Communications with India. There are four volumes on Customs, two on Ceylon, one on Church-rates, one on the Caffre Tribes, one on Newspaper Stamps, &c.; while other volumes contain Reports on the Property Tax, the Militia, the Ordnance Survey, Public Libraries, Law of Partnership, &c. From commissioners, we have Reports on Fisheries, Emigration, National Gallery, Public Records, Board of Health, Factories, Furnaces, Mines and Collieries, Education, Maynooth College, Prisons, Public Works, &c.

The fourth section of these parliamentary papers for 1851 amounts to thirty volumes, and consists of *Accounts and Papers*. It is in these that the statistic finds inexhaustible wealth of material, long columns of figures with large totals, tables of the most complicated yet the clearest construction, containing a multiplicity of details bearing on the riches and resources of the empire in its most general and most minute particulars. Thus the first volume relates to 'Finance,' and includes the accounts of the Public Income and Expenditure, Public and National Debt, Income Tax, Public Works, and a vast variety of other subjects. The second volume is made up of the 'Estimates' for the Army, Navy, Ordnance, and 'Civil Services,' which includes Public Works, Public Salaries, Law and Justice, Education, Colonial and Consular Services, &c. The third volume is filled with Army and Navy Accounts and Returns. The next six volumes refer to the colonies, and consist of Accounts, Dispatches, Correspondence. The tenth is occupied with the subject of Emigration; and the eleventh with the Government of our Eastern Empire in all its vast machinery and complicated relations. The remaining volumes—for space would fail us to enumerate them in detail—

treat of such subjects as the Census, Education, Convict Discipline, Poor, Post-office, Railways, Shipping, Quarantine, Trade and Navigation Returns, Revenue, Population and Commerce, Piracy, the Slave Trade, and Treaties and Conventions with Foreign States. Last of all, as volume sixty of the set, we have the *Numerical List and General Index*, itself a goodly tome of nearly 200 pages, compiled with immense care, and arranged so perspicuously as to afford the utmost facilities for reference.

These papers, as we have said, differ greatly in size. Some consist of but a single page, others swell up to volumes two or three inches thick, and of perhaps 2000 pages. As to the contents, the majority display a mixture of letterpress with tabular matter; and while some are wholly letterpress, others present an alarming and endless array of figures—filing along, page after page, in irresistible battalions. In many, valuable maps and plans are incorporated, with occasional designs for public works, &c.

Besides these returns and papers of permanent value, there are daily issued during the session programmes of the business of the day, entitled *Votes and Proceedings*, and containing a list of the subjects, the motions, petitions, bills, &c., that are to be brought before the House, according to 'the orders of the day.' These, and all the other papers issued by parliament, may be obtained regularly through 'all the booksellers,' by any person desiring to have them. Their prices are fixed; and in the case of the larger papers, the price is printed on the back of each. Copies of bills and returns may be had separately, on payment of these affixed prices; and indeed few parties require complete sets. Some public libraries take them, as do most of the London, and one or two provincial newspapers, by which the gentlemen of the press are enabled to compile the numerous articles and paragraphs with which all newspaper readers are familiar, and which usually begin: 'By a return just issued, we learn,' &c.; or: 'From a parliamentary paper recently printed, it appears,' &c. The public is often considerably indebted to the labours of newspaper men in regard to these papers, for the exigence of space, and the necessity of beating everything into a readable shape, require them to condense the voluminous details of the returns; and their sum and substance is thus given without any encumbering extraneous matter.

The cost of complete series of the papers varies from session to session, according to the number issued, ranging usually about L.12 or L.14.

LIGHTS FOR THE NIGHT.

UNQUESTIONABLY, darkness is disagreeable. Whether to manhood hoary-headed in wisdom, or to childhood yet in soft-brained ignorance, darkness is an unpleasant fact, to be got over in the best way possible—to be got over at all events, and at any cost, and to be turned into luminosity by every expedient that can be used. Wax-tapers, to throw their soft, luxurious light on my lady's delicate face, as she lies like a beautiful piece of marble-work on her dreamy couch; shaded lamps for the grave merchant, the virtual king of the present, as he sits in his still office, ruling nations by bale and bond, and guiding the tide of events by invoices and ship's papers; Palmer's candles, under green pent-houses, for students and authors, whose eyes must withstand a double strain; the mild house-light, with a dash of economy in the selection, whether of oil, sperm, long-fours, or short-sixes, for the family group; the white camphine flame for the artist; strange mechanisms for the curious; the flaunting brilliancy of the coloured chandeliers and cut-glass shades for our English Bedouins in the gin-palace; the flaring jet of the open butchers' shops; the paper-lantern of the street-stalls; the consumptive dip of

the slop-worker; the glimmering rush-light for the sick-room; the resin torch for the midnight funeral: these, and countless other inventions—not to mention the universal gas—assert man's disinclination to transact his life in the dark, or to bound his powers by the simple arrangements of nature. There are better lights, though, than any of these, and a worse than mere physical night, be it the blackest with which romancer ever stained his innocent paper, when describing those dark deeds on desolate moors which all romancers delight in, and which send young ladies pale to bed. The night of the mind is worse than the night of time; and lamps which can dispel this are more valuable than any which make up for the loss of the sun only, though these are grand undertakings too.

Most people know what a Child's night-light is, and most people have heard of Belmont Wax, and Price's Patent Candles, though few would be able to explain exactly what the warrant guards. But who ever pretends to understand patents? The 'Belmont' every one knows; it is a mere ordinary wax-candle, which perhaps does not 'gutter' so much as others, and with wick more innocent of 'thieves' than most, but with nothing more wonderful in appearance than an ordinary candle. A Child's night-light, too, has nothing mysterious in its look. It greatly resembles the thick stumpy end of a magnificent mould, done up in a coloured card-jacket, and with a small thin wick, that gives just a point of flame, and no more, by which to light another candle, if necessary—of admirable service for this and all other purposes of a common-place bedroom. Eccentric sleepers, who write Greek hexameters, and fasten on poetic thoughts while the rest of the world are in rational slumber, might object to the feebleness of this point of light; but eccentricities need provisions of their own, and comets have orbits to which the laws of the stars do not apply. For all ordinary people, this thick candle-end is a delicious substitute for the ghastly rush-light in its chequered cage, which threw strange figures on wall and curtain, and gave nervous women the megrims. But nothing more is known of Belmonts or night-lights; their birthplace, and the manner of their making, are alike hidden from the outer world; the uninitiated accept the arcana of tallow only in the positive form. It is generally presumed that candles, in the abstract, come from some unknown place in 'the City'; but how they are made, or who is employed in their making, or how the workmen live in the greaseladen steam of the factory, not one in a thousand would know if he could—certainly none would give himself any trouble to find out. Neither should we ourselves have known, had not a little pamphlet, bearing the heading, *Special Report by the Directors to the Proprietors of Price's Patent Candle Company*, fallen into our hands. Holding the Report open on the desk before us, we will now give to our readers the net result of the moral doings of the factory.

In the winter of 1848, half-a-dozen of the boys employed in the candle manufactory used to hide themselves behind a bench two or three times a week, when work and tea were over, to practise writing on useless scraps of paper picked up anyhow, and with worn-out pens begged from the counting-house. Encouraged by the foreman of their department, who begged some rough, movable desks for them, and aided by timely but not oppressive prizes from the Messrs Wilson, and by the presence of Mr J. P. Wilson, the little self-constituted school progressed considerably, until it reached the number of thirty; then a large old building was cleared out, a rickety wooden staircase taken down, an iron one put up in its stead, and a lofty school-room, capable of holding about 100 or more, made in the place of two useless lumber-rooms. The making and furnishing that room amounted to L.172. The school for some time held to its first principles of self-government. All the instruction, discipline, and

management were supplied by the boys themselves; and when a number of elder boys joined, a committee, appointed by themselves, regulated the affairs of the community. However, this did not last long. The hot young blood and immature young brain needed a stronger curb than self-appointed committees could supply; and by a general request, the school has since been worked by authority—this authority itself guided by a general vote in many matters of choice immediately concerning the scholars. In the following summer—we are still in '48—a day-school was held in the room, to which the younger boys who were wanted in the factory at uncertain times and for indefinite periods, were sent when not employed—drafted from school to work, and from work to school, as the necessities of the factory required. The annual cost of this day-school is L.180; the total cost from the commencement, L.327.

Amusements must now be provided. The first and most obvious were tea-parties, the usual rewards to school-children, and often made very tedious affairs by the enormous quantity of talk inflicted on them. However, Mr Wilson managed better. To the first, many of the boys came dirty and untidy; the second shewed a great improvement; the third, one still greater; until now, most of the factory-boys assemble to chapel, and other places where they ought to be decent, in plain suits of black, which give them a neat and even gentlemanlike appearance: yes, though the word applied to a set of factory-boys, candlemakers, may make many of our readers smile. But for all that constitutes real gentlemanlike feeling for order, obedience to authority, courtesy of manner, the absence of rudeness, quarrelling, and other petty vices of school-boys—these factory lads, taken from the very heart of a low population, shine pre-eminently, or rather have shone, since Mr Wilson has taken their educational training so much to heart. The first tea-party was held on Easter-Monday, as a counterpoise to the attractions of Greenwich and Camberwell fairs; and it succeeded in that object, evidencing that vice is not that necessary ingredient in the pleasures of the people which some people think.

In 1849, the cholera came, peculiarly severe about Lambeth and Battersea Fields, where many of the candlemakers lived. Mr Wilson's first thought was for the young people in the factory. He consulted with his brother, and they took additional counsel of first-rate medical men, and then added to the committee a Mr Symes, a gentleman holding a field that was waiting to be built on. The result of these consultations was, that Mr Symes giving them temporary possession of the field, the night-school was closed entirely, and all the boys set to work to learn cricket—cricket as the best antidote to cholera the directors of Price's Patent could devise. Wise men these directors, with some sterling common sense and rare old hearty benevolence mixed up with their generous Saxon blood! Mr Symes was not the only stranger—for stranger he was—eager to help the directors. A Mr Graham came forward, and many others joined in offering; and altogether, as Mr J. P. Wilson says, 'everybody's heart seemed to warm up to their object.' The plan was a success. Of the whole crowd of cricket-players, only one, an interesting lad of seventeen, was lost, though most of them had kinspeople dying and dead in their own homes. That cricket-ground was not, however, useful only for physical health; it presented a beautiful and striking scene, which must have carried home to every heart deep thoughts and holy purposes to strengthen the soul as well.

'Always when the game was finished,' says Mr Wilson, 'they (the boys) collected in a corner of the field, and took off their caps for a very short prayer for the safety of themselves and their friends from cholera; and the tone in which they said their amen

to this, has always made me think, that although the school was nominally given up for the time, they were really getting from their game, so concluded, more moral benefit than any ordinary schooling could have given them.' This belief we heartily endorse. That informal prayer, made while the blood was warm with happiness and high with health, spoken in the open field, by themselves, direct to Heaven, without other interpreter between them, must have made a deep impression on the boys. Its very informality must have added to its solemnity; making it appear, and indeed making it in reality, so much more the genuine, spontaneous, heart-spoken expression of each individual, than the mere customary attendance on a prescribed form can admit. A field of six and a half acres is now rented, at the annual gross cost of L.80, the middle of which is kept for the cricket-ground, while the edges are laid down in gardens, allotted out.

During all the bright summer weather the boys worked eagerly at their gardens, and played perseveringly at cricket—making a happy and healthy use of time that otherwise must, if used well, have been spent in a dull school-room (not the most inviting of recreations, after a hard day's work at the candle-making), or idled away in the streets, amongst the unprofitable and unhealthy amusements provided for the people. Amongst other good results, Mr Wilson notices that of 'softening to the boys one of the greatest evils now existing in the factory—the night-work, for which the men and boys come in at six in the evening, to leave at six in the morning.' These workers do not go to bed, it seems, so soon as they leave work: in former days, they generally dawdled about, took a walk, or strolled into a gin-palace, as it might happen, or did anything else to kill the time until their sleeping-hour arrived. Since the cricket-ground has been established, however, they rush off to the field on leaving work at six in the morning, thoroughly enjoy themselves at gardening and cricket until about a quarter past eight; and then, after collecting in a little shed, where a verse or two of the New Testament and the Lord's Prayer are read to them, they go home to sleep, refreshed by the exercise after their unnatural hours, happy, peaceful, and healthy. These are the birches and canes of the Messrs Wilson's moral and scholastic training!

Then came the summer-excursion. The first experiment was in June 1850, when 100 of them went down to Guildford early in the morning, and returned late in the evening. It was a beautiful day, bright and cloudless; and as those London boys wandered about the country lanes and meadows of Guildford, and heard the ceaseless hum of insect life, and the uncaged birds singing high in the blue sky, and saw the wild-flowers in the hedgerows, and the glancing waters in their way, we may be sure that more than mere enjoyment was stored up in their minds, and that thoughts which might not be brought out into set phrases, but which would be undying in their influence through life, were raised in each heart that drank in the glories and the holy teaching of nature, perhaps on that day for the first time. It was something for them to think of in the toil and heat of the factory; a beautiful picture, to fill their minds while their hands were busy at their work; and the rippling rivers and singing birds would sing and flow again and again in many a young head bending carefully over its task. The excursion of the next year was on a grander scale: 250 started from Vauxhall Bridge, to go down the river to Herne Bay, which, though it may sound ludicrously Cockney-fied, was quite as much as the strength, and more than the stomachs of the little candlemakers could stand; yet very delightful, notwithstanding the qualmsiness and face-playing of the majority. This year, they are all invited by the Bishop of Winchester to the brave old castle of Farnham—a treat to which they are

looking forward with all the headlong eagerness of youth, and which, we trust, will have other and even better results than the pleasures we wish them. A bishop entertaining a set of factory children will be a welcome sight in these days of clerical pomp, when the episcopal purple so often hides the pastoral staff. It will be a rare occurrence, but a good practice begun—to be followed, we would fain hope, by its like in other districts.

The expense of the day at Guildford was L.28; of that at Herne Bay, L.48; the estimated expense of the excursion for the present year is L.55. This seems a heavy item for a single day's amusement, but the Messrs Wilson have proved the immense advantage which their boys derive from these excursions: the hope, the stimulus to exertion—as only those who have worked hard at school, and behaved well generally, join the cricket-club and the excursionists—the health, the incentive to good conduct, and the preservation from evil habits; all these varied good effects have convinced the directors that it is money well spent—money that will bring in a richer percentage than government securities or Australian gold-fields could give, for it brings in the percentage of virtue. Not always in the power of money to gain that! And right thankful ought we to be, when we have found any investment whatever which will return us such rich usurious interest for what is in itself so intrinsically valueless.

So much, then, for the Belmont Factory—for the light of that busy wax-candle making. Turn we now to the Night-Light Factory, though our notice of this must be brief; but brevity befits those thick, short candle-ends.

In the autumn of 1849, the night-light trade came into the possession of Price's Patent Candle Company. Amongst the Child's Lights we have girls to deal with as well as boys—an element not to be provided for in the Belmont arrangements, and causing a little difficulty as to their proper disposition on first starting. But nothing seems to daunt Mr Wilson. Give him but a square inch for his foothold, and his moral lever will raise any given mass of ignorance, and remove any possible amount of obstruction. After a little time, and some expense, one of the railway arches near the night-factory was taken possession of, fitted up, made water-tight, and turned into a school-room for the boys and girls of the adopted concern. The expense of preparing and furnishing that arch was L.93. Still, the girls remained as a doubtful and untried version of the Belmont success; but by the energetic aid of a lady, much experienced in such matters, and by the untiring cares of a chaplain recently appointed to the factory, and who is in reality the moral and educational superintendent of the whole, something of the uncertainty hanging over the result has been removed, and all matters have greatly improved. Inasmuch as the character of women is of more delicate texture than that of men, so are the managers of the Night-Light School more careful to secure an unexceptionable set of girls in the school, that prudent parents may send their children there without alarm, and without more danger of contamination than must always arise where a number of human beings, adults or youths, are assembled together.

Everything seems prospering. Church-organs in the school-rooms, chapel-services at various times as the different sets of workmen come and go, and flourishing schools for the mere child up to the actual young man, supply all the spiritual, intellectual, and devotional requirements of the work-people; games, gardening, excursions, and a general friendliness between masters and people, form their social happiness; and useful arts taught and about to be taught, help to make up the wellbeing of the community. Tailoring and shoemaking are to be learned, not as trades, but

as domestic aids, many working-men having found the advantage, in various ways, of being able to do those little repairs at home which perishable garments are always requiring; and a shop full of young coopers employs another section of tradesmen in rather large numbers. For this last improvement, Mr J. Wilson was obliged to take up his freedom of the city, that he might apprentice the lads to himself, as it is a rule among the coopers that no one follows this trade, which is a close one, without having learned it by regular apprenticeship. However, a freeman can take apprentices in any trade, whether close or open, provided he does teach them a *bona fide* business; and Mr Wilson availed himself of this privilege, and netted to himself a batch of young coopers, as we have said. So much can one earnest wish to be of real use to a cause or a generation enable a single individual to do! We may be sure that when we talk of our inability to do good, we mean our inattention to means, not our incapacity from want of them.

The expenses we have quoted were all originally borne by Mr J. P. Wilson. In three years, he spent £2289 in payments to teachers, in fitting up schools, in cricket-grounds, excursions, chaplain's salary, &c. His own salary is £1000 per annum. And though the proprietors have refunded all moneys spent by him on these things, and have taken on themselves the future expenses of the institutions commenced by him, yet that does not diminish the worth of his magnificent intentions, or take from the largeness of his self-sacrifice and generosity. Add to this simple expenditure—for it was made in good faith, and in the belief that it was a virtual sacrifice of income—the labour, want of rest, the constant thought at all times and under all sorts of pressure—illness and business the most frequent—and we may form a slight estimate of what this glorious work of educating his young charge has cost a man whose name we must ever mention with respect.

In Mr J. Wilson's Report, there are many points unattainable to moderate incomes and circumscribed resources, but many also that it is in the power of every man of education, and consequently of influence, to carry out in his neighbourhood. Amongst them is that simple item of the cricket-field and garden-ground. It has become so much the fashion among certain of us, renowned more for zeal than knowledge, to cry down all amusements for the people, as tending to the subversion and overthrow of morality, to shut them out from all but the church, the conventicle, and the gin-shop—that any recognition of this mistake in a more liberal arrangement, may be hailed as the inauguration of an era of common sense, and consequently of true morality. Amusements are absolutely necessary for mankind. The nation never existed on this earth which could dispense with them. Sects rise up every now and then which carry their abhorrence of all that is not fanaticism—after their own pattern—to the extreme, and which lay pleasure under the same curse with vice; but sects are cometic, and are not to be judged of after the generalisations of national character. Practically, we find that rigidity and vice, amusements and morality, go together, Siamese-like. In the year of the Crystal Palace, the London magistrates had fewer petty criminals brought before them than at any other period of the same duration; and what Mr Wilson proves in his cricket-ground, what London shewed in the time of the World's Fair, generations and countries would always exhibit in larger characters, more widely read—that the mind and body of man require amusement—simple pleasure—purposeless, aimless, unintellectual, physical pleasure—as much as his digestive organs require food and his hands work; not as the sole employment, but mixed in with, and forming the basis and the body of higher things—the strong practical woof through which the warp of golden

stuff is woven into a glorious fabric—a glorious fabric of national progression. Yes, and into a wider garment still; one that will cover many an outlying Bedouin cowering in the darkness round—one that will join together the high and the low, the good and the bad, and so knead up the baser element into amalgamation with and absorption into the higher. This is no ideal theory. It is a possibility, a practical fact, proved in this place and in that—wherever men have taken the trouble to act on rational bases and on a true acceptance of the needs of human nature. For as the quality of light is to spread, and as the higher things will always absorb the lower, so will schools and kindly sympathy diffuse knowledge and virtue among the ignorant and brutalised; and Love to Humanity will once more read its mission in the salvation of a world.

OUT-OF-DOORS LIFE IN CENTRAL EUROPE.

THE out-of-doors life enjoyed by the inhabitants of the continent, strikes a person, unacquainted with their habits and manners, more perhaps than anything which meets his eye in that part of the world. Rational, agreeable, and healthy as it is, it requires a long time before a thorough Englishman can accustom himself to it, or feel at all comfortable in eating his meals in the open air, surrounded by two or three hundred persons employed in the same manner, or crossing and recrossing, and circling round his table. He is apt to fancy himself the sole object of curiosity; while, in reality, the eyes which seem to mark him out, have in them perhaps as little speculation as if they were turned on vacancy. We have been amused, and sometimes ashamed, in witnessing the painful awkwardness of many of those numerous steam-boat voyagers who, subscribing in London for their passage to and from the Rhine in a given time, and for a trifling sum, find themselves in a few hours transported from the bustle of Oxford Street, Ludgate Hill, or the Strand, to the happy, idle, *fat*, laughing, easy enjoyment of a German *Thee-Garten*, in the midst of four or five hundred men, women, and children—all eating, drinking, and smoking as if time, cares, and business had no influence over them. It is a life so new to him, and so diametrically opposed to all his habits and notions, that, in general, it affords him anything but ease and enjoyment. To those, however, who know how to enjoy it, it affords both. There is in these popular reunions an ease and confidence, a *bonhomie* and freedom, of which a Briton, with all his boasted liberty, has no idea. What is strangest of all to him, no distinction of rank, wealth, or profession is acknowledged. There are no reserved places. The rich and the poor, the prince and the artisan, sit down at the same kind of modest little green-painted tables, with rush-bottomed chairs, all kind, affable, and jovial—all respecting each other. The child of the citizen comes up without restraint, and plays with the sword-knot of the commander-in-chief; and the little princess will naively offer her bunch of grapes to the peasant who sits at the next table with his pipe and his tall glass of Bavarian beer. And yet the truest decorum is observed. There is no noise, no rioting, no intoxication; we have never witnessed a single example of any of these inconveniences. The education and habits of all the inhabitants of this part of the world, have been from infancy so regulated, and during many generations so completely formed to this sort of life, that not the smallest ungracious familiarity ever troubles these kindly popular reunions.

But let us come to a definite description. We will take the Blum-Garten at Prague, for example—a city where the aristocracy are as exclusive, as it is called, as anywhere in the world. This garden, or rather park, is an imperial domain, having formed part of the hunting-park of the emperors of Germany in the beginning of the fourteenth century. It was planted

by the great and good Charles IV., king of Bohemia, and emperor of Germany, son of that blind king who was killed at the battle of Cressy by Edward the Black Prince. This park is situated without the fortifications of the Hradschin, at about half an hour's walk from them, in a valley formed by the river Moldau, and stretches away to the plateau which forms the eastern boundary of the valley. On the edge of this plateau, surrounded by gardens and plantations, is situated the Lust-Haus, or summer residence, in which the governor of Bohemia, or the members of the imperial family in Prague, pass some days at intervals during the summer months. The principal descent to the park is by a broad drive, which zig-zags till it gains the proper level. There are also several pleasant paths which descend in labyrinth under a profusion of lilacs and other flowering shrubs, overhung by birches and all kinds of forest-trees.

At the foot of the drive is the house of general entertainment, consisting of several apartments, together with a spacious ball-room—an indispensable requisite, as on the continent all the world dances. From this house stretches a long wide gravel space, completely shaded from the noonday heat by four or five vast lime-tree alleys, beneath which are placed some fifty or a hundred tables. A military band is always to be found on fête-days, and very good music of some kind is never wanting. Here the whole population of Prague circle with perfect freedom, and with no attempt at class separations. The first comer is first served, taking any vacant place most suited to his fancy, or to the convenience of his party. At one table may be seen the Countess Grünne, her governess, and children, taking their coffee with as much ease and simplicity as if she were in her own private garden; at another, a group of peasants, with their smiling faces and picturesque costumes; at a third table, a soldier and his old mother and sister, whom he is treating on his arrival in his native town. Then come the Archduke Stephen, with his imperial retinue, and one or two general-officers with their staffs; and at a little distance, with a merry party of laughing guests, the Prince and Princess Colorado. In short, all the tables are by and by occupied by guests continually succeeding each other, of all classes and of all professions, from the imperial family, down to the most humble artisan; all gay, amiable, condescending on the one side; happy, respectful, and free from restraint on the other. Thus the season passes in that delicious climate, which is rendered a thousand times more delicious by the harmony and good-feeling reigning throughout all these mingled classes of society. In the evening, the same joyous reunions again take place, with this exception, that after dinner (which meal takes place generally from three to four, very rarely so late as six, and that only within the last three or four years) the aristocracy drive round the broad shady alleys of the park till sunset, while the lawns and paths are crowded with innumerable groups of pedestrians, before or after taking their evening repast under the lime-trees.

But what makes summer life so agreeable in these countries, is the simplicity and cheapness with which every variety of necessary refreshment and restoration is afforded, and the multiplicity of places where such are to be found. Walk in whatever direction you may, in the environs of any town—wherever there is shade, wherever there is a grove, or a clump of acacias, limes, or chestnuts, the favourite trees for such purposes, and consequently much cultivated—there you are sure to find rest and refreshment suited to the wants and purses of all classes—from the most simple brown bread, milk, and beer, to the most delicate sweetmeats and wines. In the article of wine, however, Bohemia is not so favoured; but this is a circumstance more felt by the stranger than by the natives, who like the wines of their own country, as they do the beer better than our

ale and porter. Still, there are some passably good wines, such as Melnik, Czerniska, and one or two others, and all at a moderate price, varying from 8d. to 1s. a bottle. But in Hungary we have good wines and extraordinarily cheap, which adds much to these rural out-of-doors reunions. It is true, that some of the most fashionable restaurateurs, both in the town and country, have been much spoiled by the extravagance of the higher classes, who are here the most reckless; carrying this vice in Europe to an excess which has ruined, or greatly embarrassed, almost all the nobility of the kingdom. Notwithstanding this passion, however, for everything that is foreign, few countries can be at all compared with Hungary as to its wines, many of which are scarcely known to any but to the peasants who grow them, and the local consumers of the same class. These wines, with which every peasant's house, especially on the skirts of the mountain-districts, and every little bothy-like public-house, are abundantly furnished, are both red and white, and at a price within the reach of the poorest peasant. Even in and about the great towns—such as Presburg, near the frontier of Austria—where every article of food is double and treble the price of the interior—the wines cost no more than from 2d. to 3d. a quart. Most of the peasants grow their own, and make from 50 to 200, and even 1500 cimers or casks, containing 63 bottles each; and this is not like many of the poor, thin, acid wines, known in so many parts of Germany, the north of France, and other countries; but strong, generous beverage, with a delicious flavour, perfectly devoid of acidity, and at the same time particularly wholesome. Many of the white wines we prefer to the generality of those from the Rhine, Moselle, &c.; the red has a kind of Burgundy flavour, with a sparkling dash of champagne, and is nearly as strong as port, without its heating qualities.

For the sake of these agreeable and cheap enjoyments, the whole of the population of the towns pass a great part of the summer in the woods, orchards, and gardens in the neighbourhood, where every want of the table is supplied without the trouble of marketing, cooking, or firing; and, consequently, in the cool of a summer morning, the inhabitants of Presburg, for instance, may be seen strolling in different directions—either ascending the vine-covered hills to the fresh tops, or wending their way through the deep, shady woods, along the side of the Danube, to the Harbern or the Alt Mülau. There, after having sharpened their appetites with this charming walk, they find themselves seated at a neat little table, beneath the shade of an old chestnut or elm. The cloth is laid by the vigilant host as soon as the guest is seated, and often before, as the former knows his hour; for nothing in machinery can equal the regularity with which meal-hours are ordered, especially in Germany, where the habitual greeting on the road is: 'Ich wünsche guten appetit'—(I wish you a good appetite.) Coffee, wine, eggs, butter, sausages, Hungarian and Italian, the original dimensions of which are often two feet long, and four to five inches thick: these are to be found at the most humble houses of resort, among which are those frequented by the foresters and gamekeepers, not professed houses of entertainment, yet always provided with such materials for those who love the merry greenwood, and who extend their walks within their cool and solitary depths. And now we must speak of the expenses of these rural repasts. A party of five persons can breakfast in the above manner—that is to say, on coffee, eggs, sausages, rolls, butter, and a quart bottle of wine—for something less than 4½d. a head. Those who breakfast more simply, take coffee and rolls—and the natives rarely, if ever, eat butter in the morning, though a profusion of this, as well as of oil and lard, enters into the preparation for dinner—and such guests pay only from 8d. to 3½d. But if wine,

which is the most common native production, is taken instead of coffee, it is always cheaper. Among the middle and lower classes, the favourite refreshment is wine, household bread, and walnuts; and thus you will constantly find labourers, foresters, or wood-cutters, joyfully breakfasting together, with their large slices of brown bread and a bottle of wine, for 2d. a head. Many, again, of the lower classes of labourers bring their own home-baked bread in their pockets, and get their large tumbler of good wine to moisten it for a half-penny.

The evening, however, is the great time for recreation and redoubled enjoyment, as the labours and occupations of the day have then ceased; and all without exception, rich and poor, flock from the town to the sweet, cool, flowery repose of the woods and vineyards, and there take their evening repast in the midst of the wild luxuriance of nature, 'health in the gale, and fragrance on the breeze.' And when the sun is gone down, they return in the cool twilight to their homes, where they find that sweet sleep which movement in the open air alone can give, and which, with our more confined British habits, few but the peasant ever enjoy.

A word more on Presburg, and we have done. In winter, this place, so little known to travellers, is frequented by the best society in Hungary; and it becomes a little metropolis, to which many of the nobility resort from the distance of 300 to 500 miles—from Tokay, and beyond the Theiss and Transylvania. In summer, perhaps, it offers still more enjoyment; for although the winter-society is then scattered far and near, the town is always animated by the presence of those who are continually coming and going between Pesth and all parts of the south of Hungary and Vienna, conveyed either by the railway or by the numerous steam-boats which daily ply on the Danube. The neighbourhood, as we have already mentioned, is full of simple and healthy enjoyments, from the number of its delicious drives and walks, and places of rural entertainment, the quaint names of some of which cannot fail to amuse and attract the stranger. At about half an hour's drive from the town is the Chokolaten-Garten, much frequented for its excellent chocolate, which is manufactured on the spot. A little further on, and situated in the centre of one of the most beautiful little valleys of the Kleine Karpathen, is the Eisen-Brundel, a large house of entertainment, with a spacious dancing-room; and, without, a luxuriant grove of fine old trees, forming an impenetrable shelter, beneath which are arranged a number of tables and chairs. Here every species of entertainment is to be found, from the most simple brown bread, milk, and fruits, to the most sumptuous champagne dinners; and the prince and the peasant take their places without ceremony, as in the olden time of Robin Hood and Little John—all merry under the greenwood tree.

Numerous other and still more simple places of refreshment and enjoyment present themselves at every turn of those delicious mountain-paths, which lead through the little valleys and hollows of the vineyards overlooking the town. One of the most agreeable is on the summit of the hill, near the little chapel of St Mary, called Marien Kirche, under the Kalvarienberg, and from which the eye looks over the whole town and the plain which stretches towards Pesth, and through which the Danube winds like a vast silver serpent, till it is lost in the far woods and dim distance. Lower down, and still nearer the town, in a little valley, is 'The Entrance to the New World!' The house is deliciously situated half-way up a wooded hill crowned with pines, and clothed with rich orchards and vineyards; not far off, in another little valley, are the Patzen-Häuser, with their orchards and gardens; and higher up we come to 'The Entrance to Paradise!' whence, as might be expected, there is a most superb

view. This embraces the whole plain so far as the eye can reach towards the east and south; on the north it is bounded by the towering mountains of the Great Carpathians, the haunt of bears and wolves, wild boars and stags; and to the west, between the valleys which are formed by the hills of this smaller range of the same mountains, is seen the plain of Vienna, in the midst of which can be distinguished in a clear day the tall spire of St Stephen, rising as if from the bosom of the imperial park which conceals the capital. Beyond this towers the Neu-klosterberg, with its vast monastery; and further to the left, like white broken clouds in the blue horizon, are the snow-clad mountains of Steyer-mark (Styria.)

MY FIRST BRIEF.

I HAD been at Westminster, and was slowly returning to my 'parlour near the sky,' in Plowden Buildings, in no very enviable frame of mind. Another added to the long catalogue of unemployed days and sleepless nights. It was now four years since my call to the bar, and notwithstanding a constant attendance in the courts, I had hitherto failed in gaining business. God knows, it was not my fault! During my pupillage, I had read hard, and devoted every energy to the mastery of a difficult profession, and ever since that period I had pursued a rigid course of study. And this was the result, that at the age of thirty I was still wholly dependent for my livelihood on the somewhat slender means of a widowed mother. Ah! reader, if as you ramble through the pleasant Temple Gardens, on some fine summer evening, enjoying the cool river breeze, and looking up at those half-monastic retreats, in which life would seem to glide along so calmly, if you could prevail upon some good-natured Asmodeus to shew you the secrets of the place, how your mind would shudder at the long silent suffering endured within its precincts. What blighted hopes and crushed aspirations, what absolute privation and heart-rending sorrow, what genius killed and health utterly broken down! Could the private history of the Temple be written, it would prove one of the most interesting, but, at the same time, one of the most mournful books ever given to the public.

I was returning, as I said, from Westminster, and wearily enough I paced along the busy streets, exhausted by the stifling heat of the Vice-Chancellor's court, in which I had been patiently sitting since ten o'clock, vainly waiting for that 'occasion sudden' of which our old law-writers are so full. Moodily, too, I was revolving in my mind our narrow circumstances, and the poor hopes I had of mending them; so that it was with no hearty relish I turned into the Cock Tavern, in order to partake of my usual frugal dinner. Having listlessly despatched it, I sauntered into the garden, glad to escape from the noise and confusion of the mighty town; and throwing myself on a seat in one of the summer-houses, watched, almost mechanically, the rapid river-boats puffing up and down the Thames, with their gay crowds of holiday-makers covering the decks, the merry children romping over the trim grass-plot, making the old place echo again with their joyous ringing laughter. I must have been in a very desponding humour that evening, for I continued sitting there unaffected by the mirth of the glad little creatures around me, and I scarcely remember another instance of my being proof against the infectious high spirits of children. Time wore on, and the promenaders, one after the other, left the garden, the steam-boats became less frequent, and gradually lights began to twinkle from the bridges and the opposite shore. Still I never once thought of removing from my seat, until I was requested to do so by the person in charge of the grounds, who was now going round to lock the gates for the night. Staring

at the man for a moment half unconsciously, as if suddenly awaked out of a dream, I muttered a few words about having forgotten the lateness of the hour, and departed. To shake off the depression under which I was labouring, I turned into the brilliantly-lighted streets, thinking that the excitement would distract my thoughts from their gloomy objects; and after walking for some little time, I entered a coffee-house, at that period much frequented by young lawyers. Here I ordered a cup of tea, and took up a newspaper to read; but after vainly endeavouring to interest myself in its pages, and feeling painfully affected by the noisy hilarity of some gay young students in a neighbouring box, I drank off my sober beverage, and walked home to my solitary chambers. Oh, how dreary they appeared that night!—how desolate seemed the uncomfortable, dirty, cold staircase, and that remarkable want of all sorts of conveniences, for which the Temple has acquired so great a notoriety! In fine, I was fairly hipped; and being convinced of the fact, smoked a pipe or two—thought over old days and their vanished joys—and retired to rest. I soon fell into a profound sleep, from which I arose in the morning much refreshed; and sallying forth after breakfast with greater alacrity than usual, took my seat in court, and was beginning to grow interested in a somewhat intricate case which involved some curious legal principles, when my attention was directed to an old man, whom I had frequently seen there before, beckoning to me. I immediately followed him out of court, when he turned round and said: 'I beg your pardon, Mr —, for interrupting you, but I fancy you are not very profitably engaged just now?'

I smiled, and told him he had stated a melancholy truth.

'I thought so,' answered he with a twinkle of his bright gray eye. 'Now'—and he subdued his voice to a whisper—'I can put a little business into your hands. No thanks, sir,' said he, hastily checking my expressions of gratitude—'no thanks; you owe me no thanks; and as I am a man of few words, I will at once state my meaning. For many years, I have been in the habit of employing Mr — (naming an eminent practitioner); and feeling no great love for the profession, intrusted all my business to him, and cared not to extend my acquaintance with the members of the bar. Well, sir, I have an important case coming on next week, and as bad luck will have it, T—'s clerk has just brought me back the brief, with the intelligence that his master is suddenly taken dangerously ill, and cannot possibly attend to any business. Here I was completely flung, not knowing whom to employ in this affair. I at length remembered having noticed a studious-looking young man, who generally sat taking notes of the various trials. I came to court in order to see whether this youth was still at his ungrateful task, when my eyes fell upon you. Yes, young man, I had intended once before rewarding you for your patient industry, and now I have an opportunity of fulfilling those intentions. Do you accept the proposal?'

'With the greatest pleasure!' cried I, pressing his proffered hand with much emotion, quite unable to conceal my joy.

'It is as I thought,' muttered he to himself, turning to depart. Then suddenly looking up, he requested my address, and wished me good-morning.

How I watched the receding form of the stranger! how I scanned over his odd little figure! and how I loved him for his great goodness! I could remain no longer in court. The interesting property case had lost all its attractions; so I slipped off my wig and gown, and hastened home to set my house in order for the expected visit. After completing all the necessary arrangements, I took down a law-book and commenced reading, in order to beguile away the time. Two, three o'clock arrived, and still no tidings of my client; I

began almost to despair of his coming, when some one knocked at the outer-door; and on opening it, I found the old man's clerk with a huge packet of papers in his hand, which he gave me, saying his master would call the following morning. I clutched the papers eagerly, and turned them admiringly over and over. I read my name on the back, Mr —, six guineas. My eyes, I feel sure, must have sparkled at the golden vision. Six guineas! I could scarcely credit my good-fortune. After the first excitement had slightly calmed down, I drew a chair to the table, and looked at the labour before me. I found that it was a much entangled Chancery suit, and would require all the legal ability I could muster to conquer its details. I therefore set myself vigorously to work, and continued at my task until the first gray streak of dawn warned me to desist. Next day, I had an interview with the old solicitor, and rather pleased him by my industry in the matter. Well, the week slipped by, and everything was in readiness for the approaching trial. All had been satisfactorily arranged between myself and leader, a man of considerable acumen, and the eventful morning at length arrived. I had passed a restless night, and felt rather feverish, but was determined to exert myself to the utmost, as, in all probability, my future success hung on the way I should acquit myself that day of my duty. The approaching trial was an important one, and had already drawn some attention. I therefore found the court rather crowded, particularly by an unusual number of 'the unemployed bar,' who generally throng to hear a maiden-speech. Two or three ordinary cases stood on the cause-list before mine, and I was anxiously waiting their termination, when my client whispered in my ear: 'Mr S— (the Queen's counsel in the case) has this instant sent down to say, he finds it will be impossible for him to attend to-day, as he is peremptorily engaged before the House of Lords. The common dodge of these gentry,' continued he in a disrespectful tone. 'They never find that it will be impossible to attend so long as the *honorarium* is unpaid; afterwards—Bah! Mere robbery, sir—taking the money, and shirking the work. However, as we cannot help ourselves, you must do the best you can alone; for I fear the judge will not postpone the trial any longer. Come, and have a dram of brandy, and keep your nerves steady, and all will go well.' I need not say it required all his persuasion to enable me to pluck up sufficient courage to fight the battle, deserted as I now found myself by my leader; still, I resolved to make the attempt. Presently the awful moment arrived, and I rose in a state of intense trepidation. The judge seeing a stranger about to conduct the case, put his glass up to his eye, in order the better to make himself acquainted with my features, and at the same time demanded my name. I shall never forget the agitation of that moment. I literally shook as I heard the sound of my own voice answering his question. I felt that a hundred eyes were upon me, ready to ridicule any blunder I might commit, and even now half enjoying my nervousness. For a minute, I was so dizzy and confused, that I found it utterly impossible to proceed; but, warned by the deep-toned voice of the magistrate that the court was waiting for me, I made a desperate effort at self-control, and commenced. A dead quiet prevailed as I opened the case, and for a few minutes I went on scarcely knowing what I was about, when I was suddenly interrupted by the vice-chancellor asking me a question. This timely little incident in some measure tended to restore my self-possession, and I found I got on afterwards much more comfortably; and, gradually warming with the subject, which I thoroughly understood, finally lost all trepidation, and brought my speech to a successful close. It occupied at least two hours; and when I sat down, the judge smiled, and paid a compliment to the ability with which he was pleased to say I had conducted the

process, whilst at least a dozen hands were held out to congratulate on his success the poor lawyer whom they had passed by in silent contempt a hundred times before. So runs life. Had I failed through nervousness, or any other accident, derisive laughter would have greeted my misfortune. As it was, I began to have troops of friends. To be brief, I won the day, and from that lucky circumstance rose rapidly into practice.

Years rolled on, and I gradually became a marked man in the profession, gaining in due time that summit of a junior's ambition—a silk gown. I now began to live in a style of considerable comfort, and was what the world calls a very rising lawyer, when I one day happened to be retained as counsel in a political case then creating much excitement. I chanced to be on the popular side; and, from the exertions I made, found myself suddenly brought into contact with the leading men of the party in the town where the dispute arose. They were so well satisfied with my endeavours to gain the cause, as to offer to propose me as a candidate for the representation of their borough at the next vacancy. This proposition, after some consideration, I accepted; and accordingly, when the general election took place, found myself journeying down to D—, canvassing the voters, flattering some, consoling others, using the orthodox electioneering tricks of platform-speaking, treating, &c. Politics ran very high just then, and the two parties were nearly balanced, so that every nerve was strained on each side to win the victory. All business was suspended. Bands of music paraded the streets, party flags waved from the house windows, whilst gay rosettes fastened to the button-hole attested their wearer's opinions. All was noise, and excitement, and confusion. At length the important hour drew near for closing the polling-booths. Early in the morning, we were still in a slight minority, and almost began to despair of the day. All now depended on a few voters living at some distance, whose views could not be clearly ascertained. Agents from either side had been despatched during the night to beat up these stragglers, and on their decision rested the final issue. Hour after hour anxiously passed without any intelligence. My opponents rubbed their hands, and looked pleasant, when, about half an hour before the close of the poll, a dusty coach drove rapidly into the town, and eight men, more or less inebriated, rolled out to record their votes. The following morning, amidst the stillness of deep suspense, the mayor read the result of the election, which gave me a majority of three. Such a shout of joy arose from the liberals as quite to drown the hisses of the contending faction; and at length I rose, flushed with excitement, to return thanks. This proved the signal for another burst of applause; and amid the shouting and groaning, screaming and waving of hats, I lost all presence of mind, and fell overcome into the arms of my nearest supporters.

'Dear me, sir, you've been wandering strangely in your sleep. Here have I been a knocking at the door this half-hour. The shaving-water is getting cold, and Mr Thomas is waiting yonder in the other room, to give you some papers he's got this morning.'

I rose, rubbed my eyes, wondered what it all meant. Ah, yes; there was no mistaking the room and Mrs McDonnell's good-natured Scotch voice. It was all a dream, and my imagination had magnified the thumping at the door into the 'sweet music of popular applause.' I fell back in bed, hid my face in the pillow, sighed over my short-lived glory, and felt very wretched when my young clerk came smiling into the room. 'Here's some business at last, sir!' cried the boy with pleasure. To his astonishment, I looked carelessly at the papers, and found they consisted of 'a motion of course,' which some tender-hearted attorney had kindly sent me.

Heigh-ho! it was all to be done over again! I flung the document on the ground in utter despair; but gradually recovering my temper, I at length took heart, and fell earnestly to work. At all events, this was a *real* beginning; so I began to grow reconciled to the ruin of my stately castle of cards. It was a cruel blow, though; and now, reader, you have learned how I came by MY FIRST BRIEF.

ELECTRO-BIOLOGY—(SO-CALLED.)

THAT the phenomena now so commonly exhibited under the above title, demand a careful examination, and, if possible, a distinct explanation, will be readily admitted. It is clear that they ought not to be allowed to rest as materials for popular amusement, but should be submitted to strict scientific inquiry. The theory which so boldly ascribes them to electric influence, should be strictly examined. If this theory is found to be untenable, some important questions will remain to be considered; such as: May not the phenomena be explained on physiological principles? and, Is it not probable that the means employed may have an injurious tendency?

The extent to which public attention has been excited by the phenomena, may be guessed by a glance at the advertising columns of the *Times*, and by placards meeting the eye in various parts of the country, announcing that, 'at the Mechanics' Institute,' or elsewhere, experiments will be performed in 'electro-biology,' when 'persons in a perfectly wakeful state' will be 'deprived of the powers of sight, hearing, and taste,' and subjected to various illusions. One advertiser professes to give 'the philosophy of the science;' another undertakes to 'reveal the secret,' so as to enable *any* person to make the experiments; and another undertakes the cure of 'palsy, deafness, and rheumatism.' Lectures on the topic, in London and in the provincial towns, are now exciting great astonishment in the minds of many, and give rise to considerable controversy respecting the theory and the *modus operandi*.

It is on this latter point—the means by which the effects are produced—that we would chiefly direct our inquiry, for we shall very briefly dismiss the attempt to explain them by a vague charge of collusion or imposture.

If this charge could be reasonably maintained, it would, of course, make all further remarks unnecessary, as our topic would then no longer be one for scientific investigation, but could only be added to the catalogue of fraud. It is possible that there may have been some cases of feigning among the experiments, but these do not affect the general reality of the effects produced. So epilepsy and catalepsy have been feigned; but these diseases are still found real in too many instances. We need not dwell on this point; for it may be safely assumed, that all persons who have had a fair acquaintance with the experiments of electro-biology (so-called), are fully convinced that, in a great number of cases, the effects seen are real and sincere, not simulated. The question then remains: Are these effects fairly attributed to 'electric' influence, or may they not be truly explained by some other cause?

Before we proceed to consider this question, it will be well to give some examples of the phenomena to which our remarks apply. We shall state only such cases as we have seen and carefully examined.

A. is a young man well known by a great number of the spectators—unsuspected of falsehood—knows nothing of the experimenter or of electro-biology, not even the meaning of the words. After submitting to the process employed by the lecturer—sitting still, and gazing fixedly upon a small disk of metal for about a quarter of an hour—he is selected as a suitable subject. When told by the experimenter that he cannot open his eyes, he seems to make an effort, but does not open

them until he is assured that he can do so. He places his hand upon a table—is told that he cannot take the hand off the table—seems to make a strong effort to remove it, but fails, until it is liberated by a word from the lecturer. A walking-stick is now placed in his right hand, and he is challenged to strike the extended hand of the lecturer. He throws back the stick over his shoulder, and seems to have a very good will to strike, but cannot bring the stick down upon the hand. He afterwards declares to all who question him, that he 'tried with all his might' to strike the hand. A. has certainly no theatrical talents; but his looks and gestures, when he is made to believe that he is exposed to a terrific storm, convey a very natural expression of terror. He regards the imaginary flashes of lightning with an aspect of dismay, which, if simulated, would be a very good specimen of acting. In many other experiments performed upon him, the effects seem to be such as are quite beyond the reach of any scepticism with regard to his sincerity. He cannot pronounce his own name—does not know, or at least cannot tell, the name of the town in which he lives—cannot recognise one face in the room where scores of people, who know him very well, are now laughing at him. On the other side, we must state, that when a glass of water is given to him, and he is told that it is vinegar, he persists in saying that he tastes water, and nothing else. This is almost the only experiment that fails upon him.

B. is an intelligent man, upwards of thirty years of age, of nervous temperament. His honesty and veracity are quite beyond all rational doubt. The numerous spectators, who have known him well for many years, are quite sure that if he has any will in the matter, it is simply to defeat the lecturer's purpose. However, after he has submitted himself to the process, the experiments made upon him prove successful. He is naturally a fluent talker, but now cannot, without difficulty and stammering, pronounce his own name, an easy monosyllable—cannot strike the lecturer's hand—cannot rise from a chair, &c. We may add, that he cannot be made to mistake water for vinegar.

One more case. C. is a tradesman, middle-aged, has no tendency to mysticism or imaginative reverie—knows nothing of 'mesmerism' or 'electro-biology'—was never suspected of falsehood or imposition. He proves, however, the most pliable of all the patients—the experiments succeed with him to the fullest extent—his imagination and his senses seem to be placed entirely under the control of the experimenter. Standing before a large audience, he is made to believe that he and the lecturer are alone in the room. He cannot recognise his own wife, who sits before him. He cannot step from the platform, which is about one foot higher than the floor. When informed that his limbs are too feeble to support him, he totters, and would fall if not held. Many of the experiments upon him, shewing an extreme state of mental and physical prostration, are rather painful to witness, others are ludicrous; for instance, he is made to believe that he is out amid the snow in the depth of winter—he shivers with cold, buttons up his coat, beats the floor with his feet, brushes away the imagined fast-falling flakes from his clothes, and almost imparts to the spectators a sympathetic feeling of cold by his wintry pantomime: then he is jocosely recommended not to stand thus shivering, but to make snow-balls, and pelt the lecturer. Heartily, and with apparent earnestness, he acts according to orders. Next, he is made to believe that the room has no roof.—'You see the sky and the stars, sir?'—'Yes.'—'And there, see, the moon is rising, very large and red, is it not?'—'Yes, sir.'—'Very well: now you see this cord in my hand; we will throw it over the moon, and pull her down.' He addresses himself to the task with perfect gravity, pulls heartily. 'Down she comes, sir! down she comes!' says the experimenter: 'mind your head, sir!'—and the deluded patient falls on the

platform, as he imagines that the moon is coming down upon him.

These instances will be sufficient for our purpose. We have given them as fair average examples of many others. If any reader still supposes that these effects have all been mere acting and falsehood, we must leave that reader to see and examine for himself as we have done.* For other readers who admit the facts and want an explanation, we proceed to discuss the *modus operandi*.

In the first place, then, we assert that *there is no proof whatever* that these effects depend upon any electric influence: there is absolutely no evidence that the metallic disk, as an 'electric' agent, has any connection with the results. On this point, we invite the lecturers and experimenters who maintain that electricity is the agent in their process, to test the truth of our assertion, as they may very easily. *Ceteris paribus*—all the other usual conditions being observed, such as silence, the fixed gaze, monotony of attention—let the galvanic disk be put aside, and in its place let a sixpence or a fourpenny-piece be employed, or indeed any similar small object on which the eyes of the patient must remain fixed for the usual space of time, and we will promise that the experiments thus made shall be equally successful with those in which the so-called galvanic disk is employed. The phenomena are physiological and not electrical.

Our conviction is, that the results proceed entirely from *imagination acting with a peculiar condition of the brain*, and that this peculiarly passive and impressible condition of the brain is induced by the *fixed gaze* upon the disk. These are the only agencies which we believe to be necessary, in order to give us an explanation of the phenomena in question. In saying so, however, we are aware that such data will seem to some inquirers insufficient to account for the effects we have described. It may be said: 'We know that imagination sometimes produces singular results, but can hardly see how it explains the facts stated.' We have only to request that such inquirers, before they throw aside our explanation, will give attention to a few remarks on the power of imagination in certain conditions. We propose, 1st, To give some suggestions on this point; 2d, To notice the relations of imagination with reason; and, 3d, To inquire how far the physical means employed—the fixed gaze on the disk—may be sufficient to affect the mental organ, the brain, so as to alter its normal condition.

1. Our usual mode of speaking of imagination, is to treat it as the opposite of all reality. When we say, 'that was merely an imagination,' we dismiss the topic as not worthy of another thought. For all ordinary purposes, this mode of speaking is correct enough; but let us ask, Why is imagination so weak?—why are its suggestions so evanescent? Simply because it is under the control of reason. But if the action of reason could be suspended, we should then see how great, and even formidable, is the imaginative power. It is the most untiring of all our mental faculties, refusing to be put to rest even during sleep: it can alter the influence of all external agents—for example, can either assist or prevent the effects of medicine—can make the world a prison-house to one man, and a paradise to another—can turn dwarfs into giants, and make various other metamorphoses more wonderful than any described by Ovid; nay, these are all insufficient examples of its power when left without control; for it can produce either health, or disease, or death!

* We can corroborate the view taken by the writer of this article as to the reality of the effects produced on the persons submitting to the process, having seen many who are intimately known to us experimented on with success. The incredulity which still prevails on this subject in London can only be attributed to the necessary rarity, in so large a town, of experiments performed on persons known to the observers.—Ed.

To give a familiar instance of the control under which it is generally compelled to act: You are walking home in the night-time, and some withered and broken old tree assumes, for a moment, the appearance of a giant about to make an attack upon you with an enormous club. You walk forward to confront the monster with perfect coolness. Why? Not because you are a Mr Greatheart, accustomed to deal with giants, but because, in fact, the illusion does not keep possession of your mind even for a moment. Imagination merely suggests the false image; but memory and reason, with a rapidity of action which cannot be described, instantly correct the mistake, and tell you it is only the old elm-tree; so that here, and in a thousand similar instances, there is really no sufficient time allowed for any display of the power of imagination.

A tale is told—we cannot say on what authority—which, whether it be a fact or a fiction, is natural, and may serve very well to shew what would be the effect of imagination if reason did not interfere. It is said that the companions of a young man, who was very 'wild,' had foolishly resolved to try to frighten him into better conduct. For this purpose, one of the party was arrayed in a white sheet, with a lighted lantern carried under it, and was to visit the young man a little after midnight, and address to him a solemn warning. The business, however, was rather dangerous, as the subject of this experiment generally slept with loaded pistols near him. Previously to the time fixed for the apparition, the bullets were abstracted from these weapons, leaving them charged only with gunpowder. When the spectre stalked into the chamber, the youth instantly suspected a trick, and, presenting one of the pistols, said: 'Take care of yourself: if you do not walk off, I shall fire!' Still stood the goblin, staring fixedly on the angry man. He fired; and when he saw the object still standing—when he believed that the bullet had innocuously passed through it—in other words, as soon as reason failed to explain it and imagination prevailed—he fell back upon his pillow in extreme terror.

2. The point upon which we would insist is that, in the normal condition of the mind and the body, the power of imagination is so governed, that a display of the effects it produces while under the control of reason, can give us but a feeble notion of what its power might be in other circumstances. To make this plain, we add a few suggestions respecting the nature and extent of the control exercised by reason over imagination; and we shall next proceed to shew, that *the activity of reason is dependent upon certain physical conditions.*

We shall say nothing of a metaphysical nature respecting reason, but shall simply point to two important facts connected with its exercise. The *first*—that it suspends or greatly modifies the action of other powers—has already been noticed in our remarks on imagination; but we must state it here in more distinct terms. We especially wish the reader to understand how wide and important is the meaning of the terms 'control' and 'overrule' as we use them when we say: 'reason controls, or overrules, imagination!' When we say that, in nature, the laws which regulate one stage of existence *overrule* the laws of another and a lower stage, we do not intend to say that the latter are annulled, but that they are so controlled and modified in their course of action, that they can no longer produce the effects which would take place if they were left free from such control. A few examples will make our meaning plain. Let us contrast the operations of chemistry with those of mechanism. In the latter, substances act upon each other simply by pressure, motion, friction, &c.; but in chemistry, affinities and combinations come into play, producing results far beyond any that are seen in mechanics. On mechanical principles, the trituration of two substances about equal in hardness should simply reduce them to powder,

but in chemistry, it may produce a gaseous explosion. Again—vegetable life overrules chemistry: the leaves, twigs, and branches of a tree, if left without life, would, when exposed to the agencies of air, light, heat, and moisture, be partly reduced to dust and partly diffused as gas in the atmosphere. It is the vegetative life of the tree which controls both the mechanical and the chemical powers of wind, rain, heat, and gravitation; and it is not until the life is extinct that these inferior powers come into full play upon the tree. So, again, the animal functions control chemical laws—take digestion, for example: a vegetable cut up by the root and exposed to the air, passes through a course of chemical decomposition, and is finally converted into gas; but when an animal consumes a vegetable, it is not decomposed according to the chemical laws, but is digested, becomes chyle, and is assimilated to the body of the animal. It is obvious that animal life controls mechanical laws. Thus, the friction of two inert substances wears one of them away—the soft yields to the hard; but, on the contrary, the hand of the labourer who wields the spade or the pickaxe becomes thicker and harder by friction.

The bearing of these remarks upon our present point will soon be obvious: we multiply examples, in order to shew in what an important sense we use the word *control*, with regard to the relation of reason with imagination. As we have seen, chemistry overrules the mechanical laws; vegetation suspends the laws of chemistry; a superior department of animal life controls influences which are laws in a lower department; again, mind controls the effects of physical influences; and, lastly, one power of the mind controls, and in a great measure suspends, the natural activity of another power—*reason controls imagination.* A second fact with regard to the action of reason must be noticed—that it *requires a wakeful condition of the brain.* Some may suppose that they have reasoned very well during sleep; but we suspect that, if they could recollect their syllogisms, they would find them not much better than Mickle's poetry composed during sleep. Mickle, the translator of the *Lusiad*, sometimes expressed his regret that he could not remember the poetry which he improvised in his dreams, for he had a vague impression that it was very beautiful. 'Well,' said his wife, 'I can at least give you two lines, which I heard you muttering over during one of your poetic dreams. Here they are:

"By Heaven! I'll wreak my woes
Upon the cowslip and the pale primrose!"

If we required proof that the operation of reason demands a wakeful and active condition of the brain, we might find it in the fact, that all intellectual efforts which imply sound reasoning are prevented even by a partial sleepiness or dreaminess. A light novel may be read and enjoyed while the mind is in an indolent and dreamy state; music may be enjoyed, or even composed, in the same circumstances, because it is connected rather with the imaginative than with the logical faculty; but, not to mention any higher efforts, we cannot play a game of chess well unless we are 'wide awake.'

Now we come to our point:—Supposing that, by any means, the brain can be deprived of that wakefulness and activity which is required for a free exercise of the reasoning powers, then what would be the effect on the imagination? For an answer to this query, we shall not refer to the phenomena of natural sleep and dreaming, because it is evident that the subjects of the experiments we have to explain are not in a state of natural sleep; we shall rather refer to the condition of the brain during what we may call 'doziness,' and also to the effects sometimes produced by disease on the imagination and the senses.

We all know that in a state of 'doziness,' any

accidental or ridiculous image which happens to suggest itself, will remain in the mind much longer than in a wakeful condition. A few slight, shapeless marks on the ceiling will assume the form of a face or a full-length figure; and strange physiognomies will be found among the flowers on the bed-curtains. In the impressionable and passive state of the brain left by any illness which produces nervous exhaustion, such imaginations often become very troublesome. Impressions made on the brain some time ago will now reappear. Jean Paul Richter cautions us not to tell frightful stories to children, for this reason—that, though the 'horrible fancies' may all be soon forgotten by the healthful child, yet afterwards, when some disease—a fever, for instance—has affected the brain and the nerves, all the dismissed goblins may too vividly reproduce themselves. Our experience can confirm the observation. Some years ago, we went to a circus, where, during the equestrian performances, some trivial popular airs were played on brass instruments—cornets and trombones—dismally out of tune. Now, by long practice, we have acquired the art of utterly turning our attention away from bad music, so that it annoys us no more than the rumble of wheels in Fleet Street. We exercised this voluntary deafness on the occasion. But not long afterwards, we were compelled, during an attack of disease which affected the nervous system, to hear the whole discordant performance repeated again and again, with a pertinacity which was really very distressing. Such a case prepares us to give credit to a far more remarkable story, related in one of the works of Macnish. A clergyman, we are told, who was a skilful violinist, and frequently played over some favourite *solo* or *concerto*, was obliged to desist from practice on account of the dangerous illness of his servant-maid—if we remember truly, phrenitis was the disease. Of course, the violin was laid aside; but one day, the medical attendant, on going toward the chamber of his patient, was surprised to hear the violin-solo performed in rather subdued tones. On examination, it was found that the girl, under the excitement of disease, had imitated the brilliant divisions and rapid passages of the music which had impressed her imagination during health! We might multiply instances of the singular effects of peculiar conditions of the brain upon the imaginative faculty. For one case we can give our personal testimony. A young man, naturally imaginative, but by no means of weak mind, or credulous, or superstitious, saw, even in broad daylight, spectres or apparitions of persons far distant. After being accustomed to these visits, he regarded them without any fear, except on account of the derangement of health which they indicated. These visions were banished by a course of medical treatment. In men of great imaginative power, with whom reason is by no means deficient, phenomena sometimes occur almost as vivid as those of disease in other persons. Wordsworth, speaking of the impressions derived from certain external objects, says:

————— on the mind
They lay like images, and seemed almost
To haunt the bodily sense!

Again, in his verses recording his impression of the beauty of a bed of daffodils, he says:

And oft, when on my couch I lie, [dozing?]
They flash before that inward eye
Which is the bliss of solitude.

These words are nothing more, we believe, than a simple and unexaggerated statement of a mental phenomenon.

Enough has now been said to shew, that in a certain condition of the brain, when it is deprived of the wakefulness and activity necessary for the free use of reason, the effects of imagination may far exceed any

that are displayed during a normal, waking state of the intellectual faculties. The question now remains: Are the means employed by the professors of electro-biology sufficient to produce that peculiar condition to which we refer? We believe that they are; and shall proceed to give reasons for such belief.

3. What are these means? or rather let us ask, 'Amid the various means employed, which is the real agent?' We observe that, in the different processes by which—under the names of electro-biology or mesmerism—a peculiar cerebral condition is induced, such means as the following are employed:—Fixed attention on one object—it may be a metallic disk said to have galvanic power, or a sixpence, or a cork; silence, and a motionless state of the body are favourable to the intended result; monotonous movements by the experimenter, called 'passes,' may be used or not. The process may be interrupted by frequent winking, to relieve the eyes; by studying over some question or problem; or, if the patient is musical, by going through various pieces of music in his imagination; by anything, indeed, which tends to keep the mind wakeful. Now, when we find among the various means *one* invariably present, in some form or another—*monotony of attention producing a partial exhaustion of the nervous energy*, we have reason to believe that *this* is the real agent.

But how can the 'fixed gaze upon the disk' affect reason? Certainly, it does not immediately affect reason; but through the nerves of the eye it very powerfully operates on the organ of reason, the brain, and induces an impressive, passive, and somnolent condition.

Such a process as the 'fixed gaze on a small disk for about the space of a quarter of an hour,' must not be dismissed as a trifle. It is opposed to the natural wakeful action of the brain and the eye. Let it be observed that, in waking hours, the eye is continually in play, relieving itself, and guarding against weariness and exhaustion by unnumbered changes of direction. This is the case even during such an apparently monotonous use of the eye as we find in reading. As sleep approaches, the eye is turned upwards, as we find it also in some cases of disease—hysteria, for example; and it should be noticed, that this position of the eye is naturally connected with a somnolent and dreaming condition of the brain. In several of the subjects of the so-called electro-biological experiments, we observed that the eyes were partially turned upward. It is curious to notice that this mode of acting on the brain is of very ancient date, at least among the Hindoos. In their old poem, the *Bhagavad-Gita*, it is recommended as a religious exercise, superior to prayer, almsgiving, attendance at temples, &c.; for the god Krishna, admitting that these actions are good, so far as they go, says: '*but he who, sitting apart, gazes fixedly upon one object until he forgets home and kindred, himself, and all created things—he attains perfection.*' Not having at hand any version of the *Bhagavad-Gita*, we cannot now give an exact translation of the passage; but we are quite sure that it recommends a state of stupefaction of the brain, induced by a long-continued fixed gaze upon one object.

We have now stated, 1st, That such an act of long-fixed attention upon one object, has a very remarkable effect on the brain; 2d, That in the cerebral condition thus induced, the mental powers are not free to maintain their normal relations to each other; especially, will, comparison, and judgment, appear to lose their requisite power and promptitude of action, and are thus made liable to be overruled by the suggestions of imagination or the commands of the experimenter.

To this explanation we can only add, that all who doubt it may easily put it to an experimental test. If it is thought that the mere 'fixed gaze,' without electric or galvanic agency, is not sufficient to produce the phenomena in question, then the only way of

determining our dispute must be by fair experiment. But here we would add a word of serious caution, as we regard the process as decidedly dangerous, especially if frequently repeated on one subject.

To conclude: we regard the exhibitions now so common under the name of electro-biology as delusions, so far as they are understood to have any connection with the facts of electricity; so far as they are *real*, we regard them as very remarkable instances of a mode of acting on the brain which is, we believe, likely to prove injurious. As we have no motive in writing but simply to elicit the truth, we will briefly notice two difficulties which seem to attend our theory. These are—1. The *rapid transition* from the state of illusion to an apparently wakeful and normal condition of mind. The patient who has been making snow-balls in a warm room, and has pulled the moon down, comes from the platform, recognises his friends, and can laugh at the visions which to him seemed realities but a few minutes since. 2. The *apparently slight effects* left, in some cases, after the experiments. Among the subjects whom we have questioned on this point, one felt 'rather dizzy' all the next day after submitting to the process; another felt 'a pressure on the head'; but a third, who was one of the most successful cases, felt 'no effects whatever' afterwards; while a fourth thinks he derived 'some benefit' to his health from the operation. We leave these points for further inquiry.

NEW MOTIVE-POWER.

We copy the following from an American newspaper, without vouching for the accuracy of the statement:—*'The Cincinnati Atlas* announces a wonderful invention in that city. Mr Solomon, a native of Prussia, is the inventor. He is a gentleman of education, and was professor of a college in his native land at the age of twenty-five. In Cincinnati, he prosecuted his scientific researches and experiments, which now promise to result in fame, wealth, and honour to himself, and incalculable benefit to the whole human family. The invention of a new locomotive and propelling power by Mr Solomon was mentioned some six months ago; and a few days ago, his new engine, in course of construction for many months, was tested, and the most sanguine expectations of the inventor more than realised. The *Atlas* says: "On Monday last, the engine was kept in operation during the day, and hundreds of spectators witnessed and were astonished at its success. The motive-power is obtained by the generation and expansion, by heat, of carbonic acid gas. Common whiting, sulphuric acid, and water, are used in generating this gas, and the 'boiler' in which these component parts are held, is similar in shape and size to a common bomb-shell. A small furnace, with a handful of ignited charcoal, furnishes the requisite heat for propelling this engine of 25 horse-power. The relative power of steam and carbonic acid is thus stated:—Water at the boiling-point gives a pressure of 15 pounds to the square inch. With the addition of 30 degrees of heat, the power is double, giving 30 pounds; and so on, doubling with every additional 30 degrees of heat, until we have 4840 pounds under a heat of 452 degrees—a heat which no engine can endure. But with the carbon, 20 degrees of heat above the boiling-point give 1080 pounds; 40 degrees give 2160 pounds; 80 degrees, 4320 pounds; that is, 480 pounds greater power with this gas, than 451 degrees of heat give by converting water into steam! Not only does this invention multiply power indefinitely, but it reduces the expense to a mere nominal amount. The item of fuel for a first-class steamer, between Cincinnati and New Orleans, going and returning, is between 1000 and 1200 dollars, whereas 5 dollars will furnish the material for propelling the boat the same distance by carbon. Attached to the new engine is also an apparatus for condensing the gas after it has passed through the cylinders, and returning it again to the starting-place, thus using it over and over, and allowing none to escape. While the engine was in operation on Monday, it lifted a weight of 12,000 pounds up the distance of five feet

perpendicular, five times every minute. This weight was put on by way of experiment, and does by no means indicate the full power of the engine."

GOOD-NIGHT.

GOOD-NIGHT! a word so often said,
The heedless mind forgets its meaning;
'Tis only when some heart lies dead
On which our own was leaning,
We hear in maddening music roll
That lost 'good-night' along the soul.

'Good-night'—in tones that never die
It peals along the quickening ear;
And tender gales of memory
For ever wait it near,
When stilled the voice—O crush of pain!
That ne'er shall breathe 'good-night' again.

Good-night! it mocks us from the grave—
It overleaps that strange world's bound
From whence there flows no backward wave—
It calls from out the ground,
On every side, around, above,
'Good-night,' 'good-night,' to life and love!

Good-night! Oh, wherefore fades away
The light that lived in that dear word?
Why follows that good-night no day?
Why are our souls so stirred?
Oh, rather say, dull brain, once more,
'Good-night!'—thy time of toil is o'er!

Good-night!—Now cometh gentle sleep,
And tears that fall like welcome rain.
Good-night!—Oh, holy, blest, and deep,
The rest that follows pain.
How should we reach God's upper light
If life's long day had no 'good-night?' O.

ENGLISH INDEPENDENCE.

Somebody—and we know not whom, for it is an old faded yellow manuscript scrap in our drawer—thus rebukes an Englishman's aspiration to be independent of foreigners: A French cook dresses his dinner for him, and a Swiss valet dresses him for his dinner. He hands down his lady, decked with pearls that never grew in the shell of a British oyster, and her waving plume of ostrich-feathers certainly never formed the tail of a barn-door fowl. The viands of his table are from all countries of the world; his wines are from the banks of the Rhine and the Rhone. In his conservatory, he regales his sight with the blossoms of South American flowers; in his smoking-room, he gratifies his scent with the weed of North America. His favourite horse is of Arabian blood, his pet dog of the St Bernard breed. His gallery is rich with pictures from the Flemish school and statues from Greece. For his amusement, he goes to hear Italian singers warble German music followed by a French ballet. The ermine that decorates his judges was never before on a British animal. His very mind is not English in its attainments—it is a mere picnic of foreign contributions. His poetry and philosophy are from ancient Greece and Rome, his geometry from Alexandria, his arithmetic from Arabia, and his religion from Palestine. In his cradle, in his infancy, he rubbed his gums with coral from Oriental oceans; and when he dies, he is buried in a coffin made from wood that grew on a foreign soil, and his monument will be sculptured in marble from the quarries of Carrara. A pretty sort of man this to talk of being independent of foreigners! *Harper's Magazine.*

Printed and Published by W. and R. CHAMBERS, High Street, Edinburgh. Also sold by W. S. ORR, Amen Corner, London; by N. CHAMBERS, 55 West Nile Street, Glasgow; and J. M'GLASSAY, 50 Upper Sackville Street, Dublin.—Advertisements for Monthly Parts are requested to be sent to MAXWELL & CO., 31 Nicholas Lane, Lombard Street, London, to whom all applications respecting their insertion must be made.

THE MARTYR SEX.

EVER since that unfortunate affair in which the mother of mankind was so prominently concerned, the female sex might say, with Shylock, 'Sufferance is the badge of all our tribe.' They are, in fact, an incarnation of the Passive Voice—no mistake about it. 'Ah, gentle dames, it gars me greet,' as Burns pathetically says, to think on all the hardships and oppressions which you have undergone throughout the course of history, political and domestic. It is most wonderful that you can bear up your heads at all in the world. Most assuredly it could not be done except under favour of some inherent principle of fortitude, quite beyond all that your associate, Man, has ever displayed. For this reason, I propose to fix upon you the honourable style and title of the Martyr Sex.

As insanity is the more affecting when we observe its victim to be unconscious of the visitation, so does my heart bleed most particularly for the Martyr Sex, when I observe them undergoing severe oppressions without knowing it. So natural is suffering to the sex, or so accustomed are they to it, that they subject themselves spontaneously to enormous loads of trouble and torture, which no one would think of imposing upon them, and which they might easily avoid. It might almost be said, that suffering has a sort of fascination for them, drawing them placidly into it, whether they will or not. It seems in some mysterious way wrought up with their entire destiny.

Hence, at no period of the history of the Sex, do we find them free from some form of amateur affliction. At one time, it is one part of their persons, at another time, another, which is subjected to voluntary distress—but always some part. Not that the shifting is, so far as can be seen, designed as a measure of relief; it would rather appear the object simply is—to make every part bear its share in turn, and allow none to escape. Thus, about a hundred years ago, a lady went about with shoes that raised her heels three inches above the floor, and threw her whole person out of its proper balance, occasioning, of course, a severe strain upon certain muscles, attended by constant pain. A little later, her feet might have been found restored to their right level; but, as if to make up for this, and allow no interval of misery, a tower of hair, pomatum, flour, pins, and pinners, had been reared on the head, such as an inquisitor might have considered himself very ingenious in devising, as a means of undoing the convictions of heretics, or bringing round a Jew to Christianity. *Vixit*, it was a most portentous engineering for the affliction of female humanity; but how heroically it was endured! A whole generation bore it without a sigh!

It often cost them their night's rest merely to get it properly put in order—for, dressing being in those days very elaborate, the attendants had to prepare some ladies one day for a party that was to take place the next. They would sit, however, in a chair all night, in order to preserve the structure in all its integrity, sleeping only by snatches, and often waking in terror lest something might be going wrong. Talk of the martyrs of science—Galileo in prison, Bruno at the stake. These men had something of importance in view to sustain them in their trials. Give me the Martyr Sex, who sacrifice ease and convenience, without having any adventitious principle whatever to compensate for and support them under their sufferings.

In more recent times, we have seen the entire Sex submitting to torture in a middle ground—namely, the waist—with an equal degree of magnanimity. The corsets also formed an engine which would have perfectly fitted the purposes of the Inquisition; indeed, there were some ingenious devices of the Holy Office which did not greatly differ from it. It might almost shake the common-sense of admiration for martyrly sufferings, to find that every little girl in England was for some years both able and willing to endure a regular torture, without apparently having the least idea of making any merit by her patience. Present pains, possible consequences—such as red noses, bad breath, permanent ill health, death itself—were made light of. There being no imaginable good end to be served by it, was nothing to the point. The corsets were, for a time, a proud symbol of the martyr power of the Sex. You would see an example set forth in each milliner's window, carefully disposed under a glass-shade, as indicating the pride they felt in it as a sort of badge of honour. It is to be hoped that a few special copies will be preserved in our antiquarian museums, and, if possible, they should be such as can be certified to have killed their wearers, in order to shew to future generations what the women of our age could submit to in *that particular line*—not *generally* of course, for it is to be expected that the women of the future will have equal sufferings in some other walk to boast of.

It is not always, indeed, that the Sex have a master torment, like tight stays, to endure; but certainly they are never without some source of either anguish or inconvenience to keep their martyr power in exercise. For one thing, they are sadly afflicted with over-large shoes. Strange to say, though there are artists pretending to be ladies' shoemakers, the sex never get shoes sufficiently small. Every now and then, they are receiving some monstrous affront, in the form of a pair of shoes that might hold sufficient meal for a pudding besides their feet. From this cause flow

certain pains and penalties in the form of corns and bunions, insuring that they shall never take a step in life without being reminded of the doom of suffering which has been passed upon them. To speak of the simple incommodations which they suffer from dress were endless. At one time, they are all blown out into sleeve, so that a miscellaneous dinner-party looks like a series of men and women with feather-beds stuck between each pair. At another time, the sleeve, while moderate in the region of the upper arm, is fashioned wide at the bottom, as if to allow of the fair wearers laughing in it—the joke, however, being all against themselves, seeing that the pendulous part is a source of continual trouble and worry, from its trailing through every sauce and tart that may be at table, till it becomes a kind of geological phenomenon, in the illustration which it affords of the succession of deposits and incrustations. Or the swelling falls mainly into a lower part of the dress, taking the form of a monstrous prolongation of skirts, and insuring that the fair Martyrs shall act as scavengers upon every street in which they promenade. I hardly know a more interesting sight than that of a young lady going to school on a wet day, with books to carry in one hand, and an umbrella to sustain in the other. To see the struggles she makes in such circumstances to keep her skirts from dragging in the mud, or the patience with which she submits to their unavoidably doing so, and to think of the sad condition of her lower extremities all the time—to reflect, moreover, that all this trouble and suffering could be avoided by merely having skirts of a sufficient, but not over-sufficient length—presents such an affecting picture of evils voluntarily encountered and heroically sustained, as but rarely occurs in the course of human life. It is justly held as a strong proof of patience, that you should calmly submit to be spat upon, or have mud thrown upon you by some infuriated crowd; but here is a gentle creature who literally goes out every day to endure the certain contact of these nuisances, and comes home to dinner not in much better plight than one who has sat (unpopularly) in the pillory for an hour. I really must give such martyrdom the meed of my admiration; and the more so, that I feel myself, under the hardening effects of worldly common-sense, totally unprepared to go through such hardships without some useful end to be served by it.

The last example of what may be called the Martyrdom of Inconvenience which the Sex have shewn, is to be found in a form of bonnet adapted for summer wear, in which the front comes only to about an inch behind the forehead, so as to leave the face fully exposed to the attacks of the sun (when there is one) and the unmitigated gaze of the beaux. There is something very remarkable in this fashion, for a great number of ladies find it absolutely indispensable to add to this abbreviation of a bonnet a sort of supplement of silk called an *ugly*, wherewith to screen the face from becoming an absolute photograph. A couple of inches added to the bonnet itself would serve the end; but this would give a regular and not inelegant protection. It would, therefore, entirely prevent inconvenience, and so thwart the Sex in their martyrly propensities. Such a thing is not to be thought of. On the contrary, either to suffer from sunlight without an *ugly*, or to suffer from clumsiness with one, enables the unfortunate Sex to indulge in its favourite passion to the fullest extent possible in such cases. Admirable portion of creation! what merits are yours, what praise is called for fully to requite you! But, indeed, it must be quite impossible ever to make sufficient acknowledgment of that wonderful power of endurance for its own sake which you shew in the most trivial, as in the most important phases of life!

I therefore quit the subject with a humiliating sense of my utter incompetency to do it entire justice. I weep and wonder—my very soul thrills with the pathos

of woman's martyr position on the earth and her volunteer sufferings above all. But I would vainly attempt to utter all I feel. I must leave it to each bearded fellow-creature, as he walks through the wilderness of this world, to behold with a sympathising eye and spirit an endurance so affecting, and endeavour to compensate it, to the individual sufferers within his reach, by every consolation and every reward he may have it in his power to bestow.

THE YOUNGEST BRITISH COLONY.

WHICH is the youngest British colony? Simple as the question seems, it may be doubted, considering the remarkable increase of late years in the number of John Bull's colonial progeny, whether the most experienced red-tapist of Downing Street could answer it without some hesitation. At least a dozen infant communities occur at once to the recollection. There is Port Phillip, lately rechristened by the royal name of Victoria, and now seemingly in a fair way to be smothered in its cradle by a deluge of gold-dust. There is the Hudson's Bay Company's little Cinderella of Vancouver's Island, with its neglected coal-mines, and other mineral riches. Then we have the precocious 'Canterbury' pet, the 'young Virginia' of New Zealand. Nor must we forget the storm-vexed colony of Labuan, ushered into existence amid typhoons and parliamentary debates—nor the small castaways, growing up in secluded islets and corners—in the Falkland Islands, the Auckland Islands, on the Mosquito Shore, and in the far Eastern Seas. It is in one of these directions that most persons would probably be inclined to cast an inquiring glance before attempting to answer the question with which these remarks are prefaced. It is not likely that many would at once be able to recall to mind the fact, that an important British colony, dating its official existence from the 22d of March 1851, has suddenly sprung up in the interior of Africa—a colony already possessing an efficient legislature, a handsome revenue, and several flourishing towns, with churches, schools, a respectable press, and other adjuncts, of civilisation. A brief description of this remarkable colony may serve to awaken for it an interest which its future progress, if at all corresponding with the past, will probably keep alive.

There is some difficulty in describing the 'Orange River Sovereignty'—for such is the long and rather awkward name by which this settlement is now known—so as to convey a correct idea of its situation without the aid of a map. That the Cape Colony occupies the southern coast of the African continent, and that the colony of Natal is on the south-eastern coast, are facts of which few readers will need to be reminded. Will it, then, be sufficient to say, that the 'sovereignty' in question is situated in the interior, between these two colonies, having the Cape on the south, and Natal on the east? It will be necessary to refer briefly to the manner in which it acquired its rank as a colony, and its peculiar name. Just two hundred years ago, in the year 1652, the Cape Colony was founded by the Dutch; and about fifty years ago, it came into the possession of our own government. During these two centuries, the colony has been constantly extending itself towards the east and north, just as the British settlements in North America, which were founded about the same time, have been ever since extending their borders towards the west and south, or as the settlements of Eastern Australia have been spreading to the west, south, and north. It is a natural movement of colonisation, and there seems to be no means of checking it, even if any advantage were to be gained by doing so.

As the American backwoodsmen, in their progress westward, reached at last the boundary-streams—as they were once considered—of the Mississippi and the Ohio, so the South-African colonists gradually found

their way to the great Orange River, which, flowing nearly across the continent, from east to west, formed a sort of natural limit to the old colony. But beyond this boundary, extensive plains and undulating downs, covered with nutritious herbage like the American prairies, spread out invitingly towards the distant northern horizon. The exterminating wars among the native tribes had left these grassy plains almost wholly unoccupied. You might travel over them for days without meeting a human being, or any traces of human possession, except here and there the decaying huts and bleaching skeletons of the former inhabitants. The feeble remnants of these tribes had sought refuge in the recesses of the neighbouring mountains, where some of them, in their dire extremity, sustained a horrid existence by cannibalism, which revolting custom still further diminished their numbers, and has only recently been suppressed. The Cape 'boers,' or farmers, rich as the patriarchs of old in cattle and sheep, and straitened like them for pasture, gradually found their way over the river into these fruitful and vacant plains. At first, they crossed only in small numbers, and with no intention of remaining permanently. But the abolition of slavery, the mismanaged Caffre wars, and some unpopular measures of the Cape government, suddenly gave a great impulse to the emigration.

About fifteen years ago, some thousands of Dutch colonists sold their farms, packed their household gear in their huge capacious wagons, and with their wives and children—in all, at least 10,000 souls—accompanied by myriads of cattle, sheep, and horses, crossed the Orange River, and plunged into the vast wilderness beyond. Some spread themselves over the rich pastures in the country lying immediately north of that river, and now forming the infant colony which is presently to be described. Others penetrated far to the north, forded the Vaal or Yellow River, and planted corn-fields and vineyards on the fertile slopes of the Kasha Mountains, where they still maintain themselves as a self-governed and thriving community. One small band of bold adventurers found their way to the verdant but fever-haunted plains about Delagoa Bay, whence the few survivors were presently driven by the destructive ravages of the pestilence. But the main column of the emigrants, turning to the right, crossed the lofty chain of the Drakenberg—the 'Rocky Mountains' of Africa—and descended into the well-watered valleys and woody lowlands of Natal. The romantic but melancholy story of the sufferings, the labours, the triumphs, and the reverses which filled up the subsequent years—how some of the emigrants were surprised and massacred by the jealous tribes of the interior, and others were treacherously slaughtered by their professed ally, the blood-thirsty chief of the Zulus—and how the exasperated survivors turned upon their assailants, broke their power, and scattered them; how they planted towns, formed a regular government, and set up an independent republic; all these, and many similar events, must be left for the future historians of South Africa to record. Neither is it necessary to refer here to the policy which led our government afterwards to extend its authority over the lands thus conquered and settled by the emigrants, or to the manner in which this authority, at first resisted, was finally established. Natal was thus made a British province in 1842. Many of the boers, naturally enough disliking the new government thus forced upon them, retraced their course over the Drakenberg, back into the upland plains of the interior. Here they were left pretty much to themselves, until the year 1848, when Sir Harry Smith proclaimed the extension of the Queen's supremacy over the whole of the territory situated between the Orange and Vaal Rivers; but, as has been already said, it was not until March of last year that this acquisition was finally sanctioned, and the new colony established by an act of the imperial government.

The Vaal River—sometimes called the Nu Gariep, and sometimes the Yellow River—is the principal tributary of the Orange River; indeed, it is so large an affluent, that some geographers have doubted, as in the case of the Mississippi and the Missouri, which should properly be considered the main stream. These rivers, the Orange and the Vaal, rising near together in the Drakenberg chain, take a wide circuit, the one to the south-west, the other to the north-west, and flow each a distance of about 400 miles before their junction. The territory which they thus enclose is nearly as large as England, comprising between 40,000 and 50,000 square miles. It is inhabited by about 80,000 natives, of various Bechnana, Namaqua, and half-caste tribes, and by some 15,000 or 20,000 colonists of European origin. Over all these inhabitants, colonists and natives, the British sovereignty has been proclaimed. Subject to this supremacy, the native chiefs and tribes are still left to manage their own affairs, according to their original laws and customs. But in order to indicate clearly and decisively the fact, that the royal authority is now paramount in this region whenever Her Majesty's government chooses to exert it, the name of the Orange River Sovereignty has been given to the whole territory.

The portion of this territory which is properly a British settlement—or, in other words, which is inhabited by Dutch and English colonists, is in extent about two-thirds of the whole. It is subdivided into four districts, for each of which a stipendiary magistrate has been appointed. These magistrates, with eight unofficial members of council—who are all respectable landowners—form, in conjunction with the 'British resident,' the legislature of the colony. The title of the Resident is borrowed from the official system of India, and was originally given to him when acting as a government commissioner for the protection of the native tribes; but his office is at present simply that of a colonial governor.

The extensive country which is thus governed, cannot be better described than in the words of Sir Harry Smith, who, in a dispatch written in January 1848, gives the following account of the whole region, which he had just traversed, on his way from the Cape to Natal. He describes it as 'a country well fitted for the pasturage of cattle, and covered in every direction with large game. It is, he adds, 'strongly undulating; and although badly watered, well adapted for the construction of dams; and, the soil being generally rich, it is capable, if irrigated, of producing every species of grain. It is miserably destitute of trees, frequently even of bush, and is thickly studded with abrupt and isolated hills, whose height frequently approaches that of mountains. Over the greater part of this tract of country, not a single native is to be seen; nor for many years, if ever, has it been inhabited by one. The gardens of the emigrants (boers) are in many places very good; their houses miserable, as they have been deterred from exhausting their little remaining capital by building on a doubtful and precarious tenure. That objection to the increase of their comfort, if the word be applicable, will now, I trust, be happily removed.' The absence of trees, of which Sir Harry speaks, is believed to have originated from the same cause which occasions a similar want in the prairies of America—that is, the native custom of burning down the grass every winter, to fertilise the soil. Where trees have been planted recently, they have grown well. The apple, pear, peach, and other fruit-trees of temperate climates, are found to thrive and produce abundantly. The whole country, it should be added, is a great plateau, elevated 2000 or 3000 feet above the level of the sea. The climate is, therefore, cooler than in Natal, which is situated in the same latitude, but at a lower elevation.

It was not till Sir Harry Smith had thus proclaimed

the royal supremacy, in 1848, that English colonists began to establish themselves in any considerable numbers in the country. But they then soon found their way thither, principally as traders, and settled in the new towns which quickly sprang up in the several districts. Bloem Fontein, the capital, is now almost wholly an English town. It has its municipality; its weekly newspaper—printed in English and Dutch; its English and 'Dutch Reformed' churches, and Wesleyan Chapel; its government school; its market; and various other appurtenances of a flourishing town, all of which have come into existence since Sir Harry Smith made his flying visit to the province in 1848, and proclaimed it subject to Her Majesty's supremacy. Such magic resides in a British governor's proclamation!

But the growth of Bloem Fontein, rapid as it has been, is not so striking as that of another town. There is a well-known story of a traveller, in a newly-settled part of North America, inquiring his way at a lonely hut to a 'city' which made a conspicuous figure in some land-speculator's map, and receiving the startling information, that he was then standing in the principal square. An adventure of much the same nature befell a traveller in South Africa, who, in February 1850, attempted, while on his way from Bloem Fontein to Natal, to discover the newly-founded town of Harrismith.

'At length,' he writes, 'having reached the eastern side of the mountain, I halted, and determined to go in search of this new-born town—a future city in our vast empire. Taking my attendant, Andries, with me, we proceeded to an elevation, where I felt sure it must come into view. We were disappointed. Not a spire, nor chimney, nor hut could be seen; and so we walked on towards another elevation. On our way, we came to an emigrant settler, busily employed in brick-making; and from him I learned that we had taken the left-hand road instead of the right, after we passed the last stream. We were about a mile from the spot marked out as the town, but no houses are built, nor are any persons residing there; so I did not deem it worth while to proceed further in that direction.' In May of the same year, 'two or three houses' are reported to have been built; in 1851, they are springing up rapidly; and at the latest date, the 9th of last January, we hear of an actual flourishing little town, with school-house, flour-mill, and bustling and increasing trade.

The progressing town, however, had its difficulties, both physical and political, to contend with. The correspondent has to report, that 'the postal arrangements still continue unsatisfactory and vexatious, no post having been received from Bloem Fontein for the last two months; and,' he indignantly adds, 'to make matters worse, the late magistrate's clerk and post-master has resigned, owing to grave charges having been preferred against him by a party faction who would rule public opinion.' But he consoles himself with the judicious reflection, that 'time and imported respectable intelligence will remedy this unhappy state of things, in the changes which small communities undergo.' It is satisfactory to learn, that in spite of the machinations of faction, the citizens managed to enjoy themselves when a suitable occasion offered. 'New-Year's Day,' we are told, 'was celebrated with more than ordinary spirit. A shooting-match took place, after which a public supper and quadrille-party came off, which finished the pleasures of the day. The next day, lovers of the turf had their enjoyment in the establishment of races.' And then we have, duly recorded in the well-known *Racing-Calendar* style, the fortunes of the competitors, for the 'Untried' Cup, the 'Harrismith Plate,' the 'Ladies' Purse,' and the 'Hack-Race;' and it is stated that 'one of the horses was sold immediately after the races for L.40,' which would seem to be considered a high figure in that region. It is further announced, 'that another year will probably

see the establishment of a fair, which will give our interior farmers and friends an opportunity of rendering a journey to Harrismith both profitable and pleasurable, as such an occasion will doubtless attract buyers of cattle, horses, sheep, wool, butter, tallow, grain, &c., from Natal.' And the correspondent is 'happy to state, that several farmers are settling upon their farms in the neighbourhood of the town, which will tend to give confidence, and increase the value of land in its vicinity.'

Thus, in less than two years, a real, bustling, hopeful little town had sprung into existence, with all the genuine characteristics of an English community. Education and trade, races and quadrilles, were already flourishing. The well-known political parties, the Buffs and the Blues, the foes of corruption and the friends of established institutions, were already arraying themselves in hostile ranks. In two years more, we may expect to receive the first numbers of the *Harrismith Gazette* and the *Harrismith Independent*, the 'organs' of the respective parties; and to learn through their valuable columns, that the 'Harrismith Agricultural and Commercial Bank' has declared its first annual dividend of 10 per cent., and that the new 'Harrismith Assembly-Rooms' were thrown open, on the auspicious anniversary of the royal birthday, to a large and select assemblage of the rank, fashion, and beauty of the city and its neighbourhood.

The writer from whose letter some of the foregoing quotations are made, strongly recommends that the government should offer 'unstinted encouragement and liberal assistance' to promote emigration from Great Britain; and considers that, if this were done, 'thousands of hardy English and Scotch farmers would avail themselves of the advantages which the country offers.' This is possible; but at the same time, it should be known, that the excitement among the native tribes, caused by the war in Caffreland, had extended across the Orange River into the sovereignty, and that much confusion, and, unfortunately, some bloodshed, had ensued. These disorders, it is true, were only local; but it is evident that the neighbourhood of some 80,000 barbarians must, for some time to come, be a source of considerable embarrassment and danger to all settlers in the new colony. In time, no doubt, with the progress of civilisation, this danger will be removed; and the natives may become, as in New Zealand, a source of wealth to the colony, as useful labourers—like the 'skipping Caffres' under the brickmaker's instructions, or peaceful cultivators of the soil. At present, however, the peril from this source is so evident and so serious, that a warning reference to it could not with propriety be omitted in any description of this otherwise promising settlement.

THE SECRET.

JEAN BAPTISTE VÉRON, a native, it was understood, of the south of France, established himself as a merchant at Havre-de-Grâce in 1788, being then a widower with one child, a young boy. The new-comer's place of business was on the south quay, about a hundred yards west of the custom-house. He had brought letters of high recommendation from several eminent Paris firms; his capital was ascertained to be large; and soon, moreover, approving himself to be a man of keen mercantile discernment, and measured, peremptory, unswerving business habits, it is not surprising that his commercial transactions speedily took a wide range, or that, at the end of about fifteen years, M. Véron was pronounced by general consent to be the wealthiest merchant of the commercial capital of northern France. He was never, albeit, much of a favourite with any class of society: his manner was too brusque, decided, unbending—his speech too short, frequently too bitter, for that; but he managed to get

his course in very difficult times quite as safely as those who put themselves to great pains and charges to obtain popularity. He never expressed—publicly at least—any preference for Royalism, Republicanism, or Imperialism; for fleur-de-lis, bonnet-rouge, or tricolore: in short, Jean Baptiste Véron was a stern, taciturn, self-absorbed man of business; and as nothing else was universally concluded, till the installation of a quasi legitimacy by Napoleon Bonaparte, when a circumstance, slight in itself, gave a clearer significance to the cold, haughty, repellent expression which played habitually about the merchant's gray, deep-set eyes, and thin, firmly-compressed lips. His newly-engraved private card read thus:—'J. B. de Véron, *Mon Séjour*, Ingouville.' *Mon Séjour* was a charming suburban domicile, situate upon the Côte, as it is usually termed—a sloping eminence on the north of Le Havre, which it commands, and now dotted with similar residences, but at the period we are writing of, very sparsely built upon. Not long after this assumption of the aristocratic prefix to his name, it was discovered that he had insinuated himself into the very narrow and exclusive circle of the De Mérodes, who were an unquestionable fragment of the old noblesse, damaged, it is true, almost irretrievably in purse, as their modest establishment on the Côte too plainly testified; but in pedigree as untainted and resplendent as in the palmiest days of the Capets. As the Chevalier de Mérode and his daughter Mademoiselle Henriette-Delphine-Hortense-Marie-Chasse-Loup de Mérode—described as a tall, fair, and extremely meagre damsel, of about thirty years of age—were known to be rigidly uncompromising in all matters having reference to ancestry, it was concluded that Jean Baptiste de Véron had been able to satisfy his noble friends, that although *de facto* a merchant from the sad necessities of the evil time, he was *de jure* entitled to take rank and precedence with the illustrious though decayed nobility of France. It might be, too, as envious gossips whispered, that any slight flaw or break in the chain of De Véron's patrician descent, had been concealed or overlooked in the glitter of his wealth, more especially if it was true, as rumour presently began to circulate, that the immense sum—in French eyes and ears—of 300,000 francs (L.12,000) was to be settled upon Mademoiselle de Mérode and her heirs on the day which should see her united in holy wedlock with Eugène de Véron, by this time a fine-looking young man, of one or two-and-twenty, and, like thirty-nine in every hundred of the youth of France, strongly prejudiced against the pretensions of mere birth and hereditary distinction.

Rumour in this instance was correctly informed. 'Eugène,' said M. de Véron, addressing his son in his usual cold positive manner, and at the same time locking his private *écritoire*, the hand of the clock being just on the stroke of five, the hour for closing—'I have a matter of importance to inform you of. All differences between me and the Chevalier de Mérode relative to your marriage with his daughter, Mademoiselle de Mérode, are—'

'Hein!' ejaculated Eugène, suddenly whirling round upon his stool, and confronting his father. 'Hein!'

'All differences, I say,' resumed M. de Véron with untroubled calm and decision, 'between myself and the chevalier are arranged à l'amiable; and the contract of marriage will be ready, for you and Mademoiselle de Mérode's signature, on Monday next at two precisely.'

'Mine and Mademoiselle de Mérode's!' repeated the astounded son, who seemed half doubtful whether he saw or heard aright.

'Yes. No wonder you are surprised. So distinguished a connection could hardly, under the circumstances, have been hoped for; and it would have been cruel to have given you any intimation on the subject whilst there was a chance of the negotiation issuing unfavourably. Your wife and you will, for the present, at

all events, take up your abode at *Mon Séjour*; and I must consequently look out at once for a smaller, a more bachelor-suited residence.'

'My wife and me!' echoed Véron junior with the same air of stupid amazement as before—'My wife and me!' Recovering a little, he added: 'Confound it, there must be some mistake here. Do you know, *mon père*, that this Mademoiselle de Mérode is not at all to my taste? I would as soon marry'—

'No folly, Eugène, if you please,' interrupted M. de Véron. 'The affair, as I have told you, is decided. You will marry Mademoiselle de Mérode; or if not, he added with iron inflexibility of tone and manner—'Eugène de Véron is likely to benefit very little by his father's wealth, which the said Eugène will do well to remember is of a kind not very difficult of transference beyond the range of the law of inheritance which prevails in France. The leprosy of the Revolution,' continued M. de Véron as he rose and put on his hat, 'may indeed be said to have polluted our very hearths, when we find children setting up their opinions, and likings and dislikings, forsooth! against their fathers' decision, in a matter so entirely within the parental jurisdiction as that of a son or daughter's marriage.'

Eugène did not reply; and after assisting his father—who limped a little in consequence of having severely sprained his ankle some eight or ten days previously—to a light one-horse carriage in waiting outside, he returned to the office, and resumed his seat, still in a maze of confusion, doubt, and dismay. 'How could,' he incoherently muttered—'how could my father—how could anybody suppose that—How could he especially be so blind as not to have long ago perceived—What a contrast!' added Eugène de Véron jumping up, breaking into passionate speech, and his eyes sparkling as if he was actually in presence of the dark-eyed divinity whose image filled his brain and loosed his tongue—'what a contrast! Adeline, young, roseate, beautiful as Spring, lustrous as Juno, graceful as Hebe! Oh, *par exemple*, Mademoiselle de Mérode, you, with your high blood and skinny bones, must excuse me. And poor, too, poor as Adeline! Decidedly, the old gentleman must be crazed, and—and let me see—Ay, to be sure, I must confer with Edouard at once.'

Eugène de Véron had only one flight of stairs to ascend in order to obtain this conference, Edouard le Blanc, the brother of Adeline, being a principal clerk in the establishment. Edouard le Blanc readily and sincerely condoled with his friend upon the sudden obscuration of his and Adeline's hopes, adding that he had always felt a strong misgiving upon the subject; and after a lugubrious dialogue, during which the clerk hinted nervously at a circumstance which, looking at the unpleasant turn matters were taking, might prove of terrible import—a nervousness but very partially relieved by Eugène's assurance, that, come what may, he would take the responsibility in that particular entirely upon himself, as, indeed, he was bound to do—the friends left the office, and wended their way to Madame le Blanc's, Ingouville. There the lover forgot, in Adeline's gay exhilarating presence and conversation, the recent ominous and exasperating communication from his father; while Edouard proceeded to take immediate counsel with his mother upon the altered aspect of affairs, not only as regarded Adeline and Eugène de Véron, but more particularly himself, Edouard le Blanc.

Ten minutes had hardly passed by ordinary reckoning—barely one by Eugène de Véron's—when his interview with the charming Adeline was rudely broken in upon by Madame le Blanc, a shrewd, prudent woman of the world, albeit that in this affair she had somewhat lost her balance, tempted by the glittering prize offered for her daughter's acceptance, and for a time apparently within her reach. The mother's tone and manner

were stern and peremptory. 'Have the kindness, Monsieur Eugène de Véron, to bid Adeline adieu at once. I have a serious matter to talk over with you alone. Come!'

Adeline was extremely startled at hearing her rich lover thus addressed, and the carnation of her glowing cheeks faded at once to lily paleness, whilst Eugène's features flushed as quickly to deepest crimson. He stammered out his willingness to attend madame immediately, and hastily kissing Adeline's hand, followed the unwelcome intruder to another room.

'So, Monsieur Eugène,' began Madame le Blanc, 'this ridiculous wooing—of which, as you know, I never heartily approved—is at an end. You are, I hear, to marry Mademoiselle de Mérode in the early part of next week.'

'Madame le Blanc,' exclaimed the young man, 'what is it you are saying? I marry Mademoiselle de Mérode next or any other week! I swear to you, by all that is true and sacred, that I will be torn in pieces by wild horses before I break faith with!'

'Chut! chut!' interrupted Madame le Blanc; 'you may spare your oaths. The sentimental bavardage of boys in love will be lost upon me. You will, as you ought, espouse Mademoiselle de Mérode, who is, I am told, a very superior and amiable person; and as to Adeline, she will console herself. A girl with her advantages will always be able to marry sufficiently well, though not into the family of a millionaire. But my present business with you, Monsieur Eugène de Véron, relates to a different and much more important matter. Edouard has just confided to me a very painful circumstance. You have induced him to commit not only a weak but a highly criminal act: he has let you have, without Monsieur de Véron's consent or knowledge, two thousand francs, upon the assurance that you would either reimburse that sum before his accounts were balanced, or arrange the matter satisfactorily with your father.'

'But, Madame le Blanc—'

'Neither of which alternatives,' persisted that lady, 'I very plainly perceive, you will be able to fulfil, unless you comply with Monsieur de Véron's wishes; and if you have any real regard for Adeline, you will signify that acquiescence without delay, for her brother's ruin would in a moral sense be hers also. Part of the money has, I understand, been squandered on the presents you have made her: they shall be returned.'

'Madame le Blanc,' exclaimed the excited young man, 'you will drive me mad! I cannot, will not give up Adeline; and as for the paltry sum of money you speak of—my money as it may fairly be considered—that shall be returned to-morrow morning.'

Madame le Blanc did not speak for a few seconds, and then said: 'Very well, mind you keep your promise. To-morrow is, you are aware, the Fête Dieu: we have promised Madame Carson of the Grande Rue to pass the afternoon and evening at her house, where we shall have a good view of the procession. Do you and Edouard call on us there, as soon as the affair is arranged. I will not detain you longer at present. Adieu! Stay, stay—by this door, if you please. I cannot permit you to see Adeline again, at all events till this money transaction is definitively settled.'

'As you have now slept upon the proposal I communicated to you yesterday afternoon,' said M. de Véron, addressing his son on the following morning at the conclusion of a silent breakfast—'you may perhaps be prepared with a more fitting answer than you were then?'

Eugène warmly protested his anxiety to obey all his father's reasonable commands; but in this case compliance was simply impossible, forasmuch as he, Eugène, had already irrevocably pledged his word, his heart, his honour, in another quarter, and could not, therefore, nay, would not, consent to poison his future existence

by uniting himself with Mademoiselle de Mérode, for whom, indeed, he felt the profoundest esteem, but not the slightest emotion of affection or regard.

'Your word, your honour, your heart—you should have added your fortune,' replied M. de Véron with frigid, slowly-distilled, sarcastic bitterness—'are irrevocably engaged, are they, to Adeline le Blanc, sister of my collecting clerk—daughter of a deceased sous-lieutenant of the line?'

'Of the Imperial Guard,' interposed Eugène.

'Who aids her mother to eke out a scanty pension by embroidery?'

'Very superior, artistic embroidery,' again interjected the son.

'Be it so. I have not been quite so unobservant, Eugène, of certain incidents, as you and your friends appear to have supposed. But time proves all things, and the De Mérodes and I can wait.'

Nothing further passed till M. de Véron rose to leave the room, when his son, with heightened colour and trembling speech, although especially aiming at a careless indifference of tone and manner, said: 'Sir—sir—one word, if you please. I have a slight favour to ask. There are a few debts, to the amount of about two thousand francs, which I wish to discharge immediately—this morning, in fact.'

'Debts to the amount of about two thousand francs, which you wish to discharge immediately—this morning, in fact,' slowly repeated De Véron, fixing on his son a triumphant, mocking glance, admirably seconded by the curve of his thin white lips. 'Well, let the bills be sent to me. If correct and fair, they shall be paid.'

'But—but, father, one, the chief item, is a debt of honour!'

'Indeed! Then your honour is pledged to others besides Mademoiselle la brodeuse? I have only to say, that in that case I will not assist you.' Having said this, M. de Véron, quite regardless of his son's angry expostulations, limped out of the apartment, and shortly after, the sound of carriage-wheels announced his departure to Le Havre. Eugène, about an hour afterwards followed, vainly striving to calm his apprehensions by the hope, that before the day for balancing Edouard's accounts arrived, he should find his father in a more Christian-like and generous mood, or, at anyrate, hit upon some means of raising the money.

The day, like the gorgeous procession that swept through the crowded streets, passed slowly and uninterruptedly away in M. de Véron's place of business, till about half-past four, when that gentleman directed a porter, who was leaving the private office, to inform M. le Blanc, that he, M. de Véron, wished to speak with him immediately. On hearing this order, Eugène looked quickly up from the desk at which he was engaged, to his father's face; but he discerned nothing on that impassive tablet either to dissipate or confirm his fear.

'Edouard le Blanc,' said M. de Véron with mild suavity of voice the instant the summoned clerk presented himself, 'it so chances that I have no further occasion for your services.'

'Sir!—sir!' gasped the terrified young man.

'You are,' continued M. de Véron, 'entitled to a month's salary, in lieu of that period of notice—one hundred francs, with which you may credit yourself in the cash account you will please to balance and bring me as quickly as possible.'

'Sir!—sir!' again bewilderedly iterated the panic-stricken clerk, as he turned distractedly from father to son—'Sir!'

'My words are plain enough, I think,' observed M. de Véron, coolly tapping and opening his snuff-box from which he helped himself to a hearty pinch. 'You are discharged with one hundred francs, a month's salary in lieu of warning, in your pocket. You have now only to bring your accounts; they are correct, of

course; I, finding them so, sign your *livret*, and there is an end of the matter.'

Edouard le Blanc made a step or two towards the door, and then, as if overwhelmed with a sense of the hopelessness of further concealment, turned round, threw himself with a cry of terror and despair at M. de Véron's feet, and poured forth a wild, sobbing, scarcely intelligible confession of the fault or crime of which he had been guilty, through the solicitations of M. Eugène, who had, he averred, received every farthing of the amount in which he, Edouard le Blanc, acknowledged himself to be a defaulter.

'Yes!—yes!' exclaimed the son; 'Edouard gave the money into my hands, and if there is any blame, it is mine alone.'

M. de Véron listened with a stolid, stony apathy to all this, save for a slight glimmer of triumph that, spite of himself, shone out at the corners of his half-closed eyes. When the young man had ceased sobbing and exclaiming, he said: 'You admit, Edouard le Blanc, that you have robbed me of nearly two thousand francs, at, you say, the solicitation of my son—an excuse, you must be aware, of not the slightest legal weight; no more than if your pretty sister, Mademoiselle Adeline, who, I must be permitted to observe, is not altogether, I suspect, a stranger to this affair—Hear me out, Messieurs, if you please: I say your excuse has no more legal validity, than if your sister had counselled you to commit this felony. Now, mark me, young man: it is just upon five o'clock. At half-past seven precisely, I shall go before a magistrate, and cause a warrant to be issued for your apprehension. To-morrow morning, consequently, the brother of Mademoiselle le Blanc will either be an incarcerated felon, or, which will suit me just as well, a proclaimed fugitive from justice.'

'One moment—one word, for the love of Heaven, before you go!' exclaimed Eugène. 'Is there any mode, any means whereby Edouard may be rescued from this frightful, this unmerited calamity—this irretrievable ruin?'

'Yes,' rejoined M. de Véron, pausing for an instant on the outer threshold, 'there is one mode, Eugène, and only one. What it is, you do not require to be told. I shall dine in town to-day; at seven, I shall look in at the church of Notre Dame, and remain there precisely twenty minutes. After that, repentance will be too late.'

Eugène was in despair, for it was quite clear that Adeline must be given up—Adeline, whose myriad charms and graces rose upon his imagination in ten-fold greater lustre than before, now that he was about to lose her for ever! But there was plainly no help for it; and after a brief, agitated consultation, the young men left the office to join Madame and Mademoiselle le Blanc at the Widow Carson's, in the Grande Rue, or Rue de Paris, as the only decent street in Havre-de-Grâce was at that time indifferently named, both for the purpose of communicating the untoward state of affairs, and that Eugène might take a lingering, last farewell of Adeline.

Before accompanying them thither, it is necessary to say a few words of this Madame Carson, who is about to play a very singular part in this little drama. She was a gay, well-looking, symmetrically-shaped young widow, who kept a confectioner's shop in the said Grande Rue, and officiated as her own *dame du comptoir*. Her good-looks, coquettishly-gracious smiles, and unvarying good temper, rendered her establishment much more attractive—it was by no means a brilliant affair in itself—than it would otherwise have been. Madame Carson was, in a tacit, quiet kind of way, engaged to Edouard le Blanc—that is to say, she intended marrying him as soon as their mutual savings should justify such a step; and provided, also, that no more eligible offer wooed her acceptance in the meantime. M. de

Véron himself was frequently in the habit of calling, on his way to or from Mon Séjour, for a pâté and a little lively badinage with the comely widow; and so frequently, at one time, that Edouard le Blanc was half-inclined—to Madame Carson's infinite amusement—to be jealous of the rich, though elderly merchant's formal and elaborate courtesies. It was on leaving her shop that he had slipped and sprained his ankle. M. de Véron fainted with the extreme pain, was carried in that state into the little parlour behind the shop, and had not yet recovered consciousness when the apothecary, whom Madame Carson had despatched her little waiting-maid-of-all-work in quest of, entered to tender his assistance. This is all, I think, that needs be said, in a preliminary way, of Madame Carson.

Of course, the tidings brought by Eugène and Edouard very painfully affected Mademoiselle le Blanc; but being a very sensible, as well as remarkably handsome young person, she soon rallied, and insisted, quite as warmly as her mother did, that the sacrifice necessary to relieve Edouard from the peril which environed him—painful, heartbreaking as that sacrifice might be—must be submitted to without reserve or delay. In other words, that M. de Véron, junior, must consent to espouse Mademoiselle de Mérode, and forthwith inform his father that he was ready to sign the nuptial-contract that moment if necessary. Poor Eugène, who was really over head and ears in love, and more so just then than ever, piteously lamented his own cruel fate, and passionately denounced the tiger-heartedness of his barbarian father; but as tears and reproaches could avail nothing in such a strait, he finally submitted to the general award, and agreed to announce his submission to M. de Véron at the church of Notre Dame, not a moment later, both ladies insisted, than five minutes past seven.

Madame Carson was not at home all this while. She had gone to church, and after devotions, called on her way back on one or two friends for a little gossip, so that it wanted only about a quarter to seven when she reappeared. Of course the lamentable story had to be told over again, with all its dismal accompaniments of tears, sighs, and plaintive ejaculations; and it was curious to observe, as the narrative proceeded, how the widow's charming eyes flashed and sparkled, and her cheeks glowed with indignation, till she looked, to use Edouard le Blanc's expression, 'ferociously' handsome. 'Le monstre!' she exclaimed, as Eugène terminated the sad history, gathering up as she spoke the shawl and gloves she had just before put off; 'but I shall see him at once: I have influence with this Monsieur de Véron.'

'Nonsense, Emilie,' said Madame le Blanc. 'You possess influence over Monsieur de Véron!'

'Certainly I do. And is that such a miracle?' replied Madame Carson with a demure glance at Edouard le Blanc. Edouard looked somewhat scared, but managed to say: 'Not at all, certainly not; but this man's heart is iron—steel.'

'We shall see,' said the fair widow, as she finished drawing on her gloves. 'La grande passion is sometimes stronger than iron or steel: is it not Monsieur Eugène? At all events, I shall try. He is in the church, you say. Very well, if I fail—but I am sure I shall not fail—I return in ten minutes, and that will leave Mademoiselle Adeline's despairing lover plenty of time to make his submission, if better may not be; and so au revoir, Mesdames et Messieurs.'

'What can she mean?' said Madame le Blanc as the door closed. 'I have noticed, once or twice during the last fortnight, that she has made use of strange half-hints relative to Monsieur de Véron.'

'I don't know what she can mean,' said Edouard le Blanc, seizing his hat and hurrying off; 'but I shall follow, and strive to ascertain.'

He was just in time to catch a glimpse of Madame Carson's skirts as they whisked round the corner of

the Rue St Jacques, and by quickening his speed, he saw her enter the church from that street. Notre Dame was crowded; but Edouard le Blanc had no difficulty in singling out M. de Véron, who was sitting in his accustomed chair, somewhat removed from the mass of worshippers, on the left of the high altar; and presently he discerned Madame Carson gently and adroitly making her way through the crowd towards him. The instant she was near enough, she tapped him slightly on the shoulder. He turned quickly, and stared with a haughty, questioning glance at the smiling confectioner. There was no *grande passion* in that look, Edouard felt quite satisfied, and Madame Carson's conduct seemed more than ever unintelligible. She appeared to say something, which was replied to by an impatient gesture of refusal, and M. de Véron turned again towards the altar. Madame Carson next approached close to his chair, and bending down, whispered in his ear, for perhaps a minute. As she did so, M. de Véron's body rose slowly up, involuntarily as it were, and stiffened into rigidity, as if under the influence of some frightful spell. Forcing himself at last, it seemed, to confront the whisperer, he no sooner caught her eye than he reeled, like one struck by a heavy blow, against the pedestal of a saint, whose stony features looked less white and bloodless than his own. Madame Carson contemplated the effect she had produced with a kind of pride for a few moments, and then, with a slight but peremptory wave of her hand, motioned him to follow her out of the sacred edifice. M. de Véron hastily, though with staggering steps, obeyed; Edouard le Blanc crossing the church and reaching the street just soon enough to see them both driven off in M. de Véron's carriage.

Edouard hurried back to the Grande Rue to report what he had witnessed; and what could be the interpretation of the inexplicable scene, engrossed the inventive faculties of all there, till they were thoroughly tired of their wild and aimless guesses. Eight o'clock chimed—nine—ten—and they were all, Edouard especially, working themselves into a complete panic of undefinable apprehension, when, to their great relief, M. de Véron's carriage drew up before the door. The first person to alight was M. Bourdon, a notary of eminence; next M. de Véron, who handed out Madame Carson; and all three walked through the shop into the back-apartment. The notary wore his usual business aspect, and had in his hands two rolls of thickly-written parchment, which he placed upon the table, and at once began to spread out. M. de Véron had the air of a man walking in a dream, and subdued, mastered by some overpowering, nameless terror; while Madame Carson, though pale with excitement, was evidently highly elated, and, to use a French phrase, completely 'mistress of the situation.' She was the first to break silence.

'Monsieur de Véron has been kind enough, Edouard, to explain, in the presence of Monsieur Bourdon, the mistake in the accounts he was disposed to charge you with to-day. He quite remembers, now, having received two thousand francs from you, for which, in his hurry at the time, he gave you no voucher. Is not that so, Monsieur de Véron?' she added, again fixing on the merchant the same menacing look that Le Blanc had noticed in the church.

'Yes, yes,' was the quick reply of M. de Véron, who vainly attempted to look the astounded clerk in the face. 'The mistake was mine. Your accounts are quite correct, Monsieur le Blanc; and—and I shall be glad, of course, to see you at the office as usual.'

'That is well,' said Madame Carson; 'and now, Monsieur Bourdon, to business, if you please. Those documents will not take so long to read as they did to write.'

The notary smiled, and immediately began reading a marriage-contract between Eugène de Véron and

Adéline le Blanc, by which it appeared that the union of those young persons was joyfully acceded to by Jean Baptiste de Véron and Marie le Blanc, their parents—the said Jean Baptiste de Véron binding himself formally to endow the bride and bridegroom jointly, on the day of marriage, with the sum of 300,000 francs, and, moreover, to admit his son as a partner in the business, thenceforth to be carried on under the name of De Véron & Son.

This contract was written in duplicate, and as soon as the notary had finished reading, Madame Carson handed a pen to M. de Véron, saying in the same light, coquettish, but peremptory tone as before: 'Now, Monsieur, quick, if you please: yours is the most important signature.' The merchant signed and sealed both parchments, and the other interested parties did the same, in silent, dumb bewilderment, broken only by the scratching of the pens and the legal words repeated after the notary. 'We need not detain you longer, Messieurs, I believe,' said Madame Carson. 'Bon soir, Monsieur de Véron,' she added, extending an ungloved hand to that gentleman, who faintly touched it with his lips; 'you will hear from me to-morrow.'

'What is the meaning of all this?' exclaimed Eugène de Véron, the instant his father and the notary disappeared. 'I positively feel as if standing upon my head!' A chorus of like interrogatories from the Le Blancs assailed Madame Carson, whose ringing bursts of mirth mocked for a time their impatience.

'Meaning, *parbleu!*' she at last replied, after pausing to catch breath. 'That is plain enough, surely. Did you not all see with what *empressement* the poor man kissed my hand? There, don't look so wretched, Edouard,' she added with a renewed outburst; 'perhaps I may have the caprice to prefer you after all to an elderly millionaire—who knows? But come, let us try to be a little calm and sensible. What I have done, good folks, I can as easily undo; and that being the case, Monsieur Eugène must sign me a bond to-morrow morning for fifty thousand francs, payable three days after his marriage. Is it agreed? Very well: then I keep these two parchments till the said bond is executed; and now, my friends, good-night, for I, as you may believe, am completely tired after all this benevolent fairy-work.'

The wedding took place on the next day but one, to the great astonishment of every one acquainted with the two families. It was also positively rumoured that M. de Véron had proposed marriage to Madame Carson, and been refused! Be this true or not, it was soon apparent that, from some cause or other, M. de Véron's health and spirits were irretrievably broken down, and after lingering out a mopish, secluded life of scarcely a twelvemonth's duration, that gentleman died suddenly at Mon Séjour. A clause in his will bequeathed 20,000 francs to Madame Carson, with an intimated hope, that it would be accepted as a pledge by that lady to respect, as she hitherto had done, the honour of an ancient family.

This pledge to secrecy would no doubt have been kept, but that rumours of poisoning and suicide, in connection with De Véron's death, having got abroad, the Procureur-Général ordered an investigation to take place. The suspicion proved groundless; but the *procès-verbal* set forth, that on examining the body of the deceased, there were discovered the letters 'I. de B.,' 'T. F.,' branded on the front of the left shoulder; the two last, initials of '*Travaux Forcés*' (forced labour), being large and very distinct. There could be no doubt, therefore, that the proud M. de Véron was an escaped *forçat*; and subsequent investigation, which was not, however, very strongly pressed, sufficiently proved that Jean Baptiste de Véron, the younger son of a high family, had in very early youth been addicted to wild courses; that he had gone to the colonies under a feigned name, to escape difficulties, at

home; and whilst at the Isle de Bourbon, had been convicted of premeditated homicide at a gaming-house, and sentenced to perpetual imprisonment with hard labour. Contriving to escape, he had returned to France, and by the aid of a considerable legacy, commenced a prosperous mercantile career; how terminated, we have just seen. It was by pure accident, or what passes for such in the world, that Madame Carson had arrived at a knowledge of the terrible secret. When M. de Véron, after spraining his ankle, was carried in a state of insensibility into the room behind her shop, she had immediately busied herself in removing his neckcloth, unfastening his shirt, then a flannel one which fitted tightly round the neck, and thus obtained a glimpse of the branded letters 'T. F.' With her customary quickness of wit, she instantly replaced the shirts, neckcloth, &c., and carefully concealed the fatal knowledge she had acquired, till an opportunity of using it advantageously should present itself.

The foregoing are, I believe, all the reliable particulars known of a story of which there used to be half-a-hundred different versions flying about Le Havre. Edouard le Blanc married Madame Carson, and subsequently became a partner of Eugène de Véron. It was not long, however, before the business was removed to another and distant French seaport, where, for aught I know to the contrary, the firm of 'De Véron and Le Blanc' flourishes to this day.

BETTING-OFFICES.

'Betting-shop' is vulgar, and we dislike vulgarity. 'Commission Office,' 'Racing Bank,' 'Mr Hoppoite Green's Office,' 'Betting-Office,' are the styles of announcement adopted by speculators who open what low people call Betting-shops. The chosen designation is usually painted in gold letter on a chocolate-coloured wire-gauze blind, impervious to the view. A betting-office may display on its small show-board two bronzed plaster horses, rampant, held by two Ethiopian figures, nude; or it may prefer making a show of cigars. Many offices have risen out of simple cigar-shops. When this is the case, the tobacco business gives way, the slow trade and fast profession not running well together. An official appearance is always considered necessary. A partition, therefore, sufficiently high not to be peered over, runs midway across the shop, surmounted with a rail. By such means, visions are suggested to the intelligent mind of desks, clerks, and, if the beholder has sufficient imagination, of bankers' clerks. In the partition is an enlarged *pigeon-hole*—not far off, may be supposed to lurk the hawk—through which are received shillings, half-crowns; in fact, any kind of coin or notes, no sum appearing inadmissible. The office is papered with a warm crimson paper, to make it snug and comfortable, pleasant as a lounge, and casting a genial glow upon the proceedings.

But the betting-lists are the attraction—these are the dice of the betting-man: a section of one of the side-walls within the office is devoted to them. They consist of long strips of paper—each race having its own slip—on which are stated the odds against the horses. Hasty and anxious are the glances which the speculator casts at the betting-lists: he there sees which are the favourites; whether those he has backed are advancing or retrograding; and he endeavours to discover, by signs and testimonies, by all kinds of movements and dodges, the knowing one's opinion. He will drop fishing words to other gazers, will try to overhear whispered remarks, will sidle towards any jockey-legged or ecurial-costumed individual, and aim more especially at getting into the good graces of the betting-office keeper, who, when his business is slack, comes forth from behind the partition and from

the duties of the pigeon-hole, to stretch his legs and hold turf-converse. The betting-office keeper is the speculator's divinity.

The office itself is but the point where the ringing of the metal takes place, where the actual business is more bindingly entered into; but on great, or, as they are technically termed, grand days, there will occur—what will also apply, perhaps, occasionally to grand operas—very heavy operations. Large numbers of the speculators will collect, forming themselves into knots and groups on the pavement, and even in the roadway contiguous to the office. Here they appear a motley congregation, a curious agglomeration of seediness. Seediness is the prominent feature of the betting mass, as they are on such occasions collected—seediness of dress and of character. Yet amongst the groups are some better-looking kine, some who seem to fatten, and who costume themselves in fully-napped cloth, and boast of ostentatious pockets, and hats which advertise the owner as knowing a thing or two. These may be touters to the office: some may be victims, who have once won a stake. The latter now neglect their ordinary calling, and pass the whole of their time in the purlieus of betting-shops. As for the touters—betting-offices are not progressive without the aid of touters—they are gentlemen who have in their time worn many kinds of character, who have always existed one way or another on the very outskirts of honesty, till some fine morning a careless step brings them from that neutral ground into the domain of the law, where they are laid hold of. They do not disdain their adopted calling; they are not above assisting errand-boys to go in for large stakes; they tempt apothecaries' apprentices by prospects of being able to come out. They know likewise the best horses, and which are sure to win.

But there are numbers of willing, untutored betting-men, who go in of their own accord—'quite promiscuous.' They belong to the class of petty tradesmen, and perhaps there are steady workmen and comfortably income'd clerks among them; although it is the tradesmen who are most numerous, and who give colour to the whole body. There is Macwait, the cheap baker, he contributes his quota weekly to the betting-shop: he has a strong desire to touch a twenty-pound stake. Whetcoles, the potato salesman, has given up a lucrative addition to his regular business—the purveying of oysters—for the sake of having more time to attend the office. Nimblecut, the hairdresser, has been endeavouring to raise his charge for shaving one half-penny per chin, to be enabled to speculate more largely. Shavings, journeyman carpenter, calculates upon clearing considerably more by 'Sister to Swindler' than a year's interest from the savings-bank. There are thousands of similarly circumstanced speculators: they make a daily, if not more frequent promenade to the betting-office; and on the days when the races come off, they may be observed in shoals, nodding and winking knowingly as they pass one another. Some are seen with jocular countenances, and pass for pleasant fellows: they are impressed with the idea that their horses are looking up. In others, the jocular expression has passed away, and the philosophical observer sets them down as melancholy individuals, given to castigating their wives, and verging downwards.

Betting-men—those who take a pride in their profession—assume generally a looseness of style: there may be an appropriateness in this, considering the mercurial contents of their pockets. In walking, a freedom of gait, approaching the swagger, is generally adopted; cigar-smoking at the office door is considered respectable; hands may be inserted *ad libitum* in pockets, and a primary coloured 'kerchief worn mildly. The individual is usually seen by the observant public making up his book. But the

evidence of shrewdness consists in familiarity with the technicalities of turf-lore; without this, coxwains of no use. The better must be well up to the jockeys' names, and those of the horses—of the races they have run—of Day's stable—of Scott's ditto—must know when the cup or 2000-guinea stakes are run for. His vocabulary comprises such words as outsiders, winners, two-year old, lame ducks, and bad books. He sometimes talks loudly, although, for the most part, he delights in a close, earnest, confidential, suppressed tone. There is nothing a better prides himself on more than being in the possession of some, to the common herd, unattainable secret—something only to be obtained once in a lifetime, and then only after severe losses—a secret brought out by some train of fortuitous and most intricately-woven events. It comes through a line of ingenious, quickwitted, up-to-everything communicators, and is made known proximately to the fortunate possessor by a diplomatic potman, who waits in a room frequented by a groom, who pumped it out of a stable-boy, who—It is not improbable that the information has somewhat deteriorated in its journeyings through mews and along dung-heaps: it is possible, when it comes to be made use of, it may be found very expensive in its application.

The turf speculator must possess a frank and willing imagination: he must calculate upon his account at the betting-shop, as he would upon so much being to his credit at a banker's; he must consider the office cheques with which his pocket-book is overflowing, as at par with bank-notes; he need keep but little gold and silver, as it is far better to know that it is producing a highly-profitable percentage. Should he be visited by any momentary fits of depression, he may draw forth his portfolio, and gratify his eyes with the contemplation of certificates for fives, and twenties, and fifties.

We must not pass over a class of speculators who bet, and yet who are not true betting-men: they do not wish to be seen in betting-shops, yet cannot keep away. They are not loungers, for they may be observed passing along the thoroughfare seemingly with all desirable intentness upon their daily business; but they suddenly disappear as they arrive at the door of the betting-shop. These are your respectable men; worthy, solid, family men. But it is not easy to enter a betting-shop, and avoid rubbing against some clinging matter. Betting-men generally are not nice in their sensibilities; and perhaps on a fine Sunday morning, proceeding with his family to the parish church, our Pharisee may receive a tip from some unshaven, strong-countenanced *sans culotte*, which may cause his nerves to tingle for the rest of the day.

But there is also a light, flimsy, fly-away-kind of speculator, a May-day betting-man—a youth fresh, perhaps, from school and the country, with whom his friends have hardly yet made up their minds what to do—who is at present seeing as much as he can see of town, upon what he finds decidedly small means. He has an ambition to appear fast; has of course a great admiration for fast people; but is at present young and fresh-coloured, and cannot, with all his endeavours, make himself appear less innocent and good-natured than he is. He has strained his purse in a bet, has betted on a winning horse, and has won five pounds. This would perhaps have fixed him for life as a speculator; but the money burns in his pocket. Before he can make up his mind to lay out his winnings on fresh bets, he must have a Hansom for the day. He decorates himself in his light-coloured paletot, blue neck-tie, and last dickey—drives to Regent Street to purchase cigars—to an oyster-shop redolent of saw-dust and lobsters—rigs a very light pair of kids—drives to, and alarms by his fast appearance, a few of his friends, who forthwith write off long woolly letters to relations in the country. He is accordingly

cited to appear at home, where he becomes a respected local junior clerk in a Welsh mining company.

There are various kinds of betting-offices. Some are speculative, May-fly offices, open to-day and shut to-morrow—offices that will bet any way, and against anything—that will accommodate themselves to any odds—receive any sum they can get, small or large; and should a misfortune occur, such as the wrong horse winning, forget to open next day. These are but second-rate offices. The money-making, prosperous betting-office is quite a different thing. It is not advisable for concerns which intend making thousands in a few years, to pay the superintendents liberally, and to keep well-clothed touters—to conduct themselves, in short, like speculative offices. They must not depend entirely upon chance. Chance is very well for betting-men, but will not do for the respectable betting-office keepers, who are the stakeholders.

The plan adopted is a very simple one, but ingenious in its simplicity. The betting-office takes a great dislike in its own mind to a particular horse, the favourite of the betting-men. It makes bets against that horse, which amount in the aggregate to a fortune; and then it buys the object of its frantic dislike. This being effected, the horse of course loses, and the office wins. How could it be otherwise? Would you have a horse win against its owner's interest? The thing being settled, the office, in order to ascertain the amount of its winnings, has only to deduct the price of the horse from its aggregate bets, and arrange the remainder in a line of perhaps five figures. Whereupon the betting-men grow seadier and more seedy; some of the more mercurial go off in a fit of apoplectic amazement; some betake themselves to Waterloo Stairs on a moonless night; some proceed to the Diggings, some to St Luke's, and some to the dogs; some become so unsteady, that they sign the wrong name to a draft, or enter the wrong house at night, or are detected in a crowd with their hand in the wrong man's pocket. But by degrees everything comes right again. The insane are shut up—the desperate transported—the dead buried—the deserted families carted to the work-house; and the betting-office goes on as before.

A MAY FLOWER-SHOW AT CHISWICK.

It is one o'clock P.M.; I am at Hyde-Park Corner; I hail the nearest 'Hansom,' and am quickly dashing away for Chiswick. The road leading thither is always a scene of great bustle: on a Chiswick fête-day, this is very much augmented. But I am early, and the increase of vehicles is not yet great. A few carriages and cabs, mostly filled with ladies, who, like myself, are early on the road, and eager to be at the scene of action, are occasionally passed; for my horse is a good one, and the driver seems to desire to do the journey in good style. The majority of passengers and conveyances are chiefly of the everyday character, and such as are always met with on this great thoroughfare. Omnibuses, with loads of dusty passengers; carts and wagons, filled with manure, and each with a man or boy dozing upon the top; teams baling at the roadside inns; troops of dirty children at the ends of narrow streets; with carriers' carts, and travel-stained pedestrians, make up the aggregate of the objects on the road. But in another hour the scene will change; the aristocratic 'turn-out,' with its brilliant appointments and opiate footmen—the cab, the brougham, and the open chariot, all filled with gaily-dressed company, will crowd the way; for a Chiswick fête is one of the events of a London season. People go there as they do to the Opera—to see and to be seen. As I journey onward, I catch glimpses of blooming fruit-trees, and green hedges, speaking of the approach of summer. The little patches of garden by the wayside are gay with flowers, but sadly disfigured with dust. Even they, however,

look quite refreshing in contrast with the close and crowded streets I have left behind. The spire of the church on Chiswick green is peeping above the houses in the distance; and by the time I have noticed the increase of bustle on the road, and about the inn-doors, the cab has stopped at one of the garden entrances. Early as I am, many others are before me, and are waiting for the hour of admission—two o'clock. The carriages of those already arrived are drawn up in rank upon the green; policemen are everywhere to preserve order; ostlers are numerous, with buckets of water and bundles of hay; groups of loungers are looking on, carriages are every minute arriving, and the bustle is becoming great. As it yet wants ten minutes to two o'clock, I shall occupy the time by giving the reader a little introduction to what we are presently to see.

There are three of these fêtes every year—one in May, another in June, and a third in July. When the weather is fine, there is always a brilliant gathering of rank, and beauty, and fashion; but the June show is usually the best attended. English gardening is always well represented here. The plants and fruit brought for exhibition astonish even those who are best acquainted with what English gardeners can do. For several seasons past, it was thought that cultivation had reached its highest point; yet each succeeding year outdid the past, and report tells me, that the plants exhibited to-day are in advance of anything previously seen. They are sent here from widely distant parts of the country—many of them are brought one or two hundred miles; but most of the large collections are from gardens at a comparatively short distance from Chiswick. The principal prize is contended for by collections of thirty stove and greenhouse plants; and their large size will be apparent, when it is stated that one such collection makes eight or ten van-loads. There are never more than three or four competitors for this prize. Their productions are generally brought into the garden on the evening previous to the day of exhibition. At about daylight on the morning of the fête, the great bustle of preparation begins. Everything has to be arranged, and ready for the judges by ten o'clock A.M., at which hour all exhibitors, and others interested in the awards, are obliged to leave the gardens; and they are not readmitted until the gates are thrown open to those who may have tickets of admission, at two o'clock.

At last they are open. (How expectation clogs the wheels of time!) I join the throng; and in a few minutes I am among the flowers, which are arranged in long tents, on stages covered with green baize, as a background to set off in bold relief their beautiful forms and tints. There are three military bands stationed in different parts of the grounds, to keep up a succession of enlivening strains until six o'clock, the hour when the proceedings, so far as the public are concerned, are supposed to terminate. One of them is already 'discoursing most eloquent music.' Company rapidly arrives; well-dressed persons are strolling through the tents, sitting beneath the trees, or on the benches, listening to the music. The scene is a gay one. The richness and beauty of the masses of flower, rivalled only by the gay dresses and bright eyes of hundreds of fair admirers; the delicate green of the trees clothed with their young foliage, and the carpet-like lawns, all lit up by a bright May sun, and enlivened by the best music, combine to form a whole, the impression of which is not easily forgotten.

But I am forgetting the flowers. Suppose we enter the nearest tent, and note the more prominent objects on our way. Here is a somewhat miscellaneous assortment; geraniums are conspicuous. The plants are remarkably fine, averaging nearly a yard across, and presenting masses of flower in the highest perfection. One is conspicuous for the richness of its colouring; its name is magnet (*Hoyle*.) There is a collection of ferns,

too; their graceful foliage, agitated by every breeze, adds much to the interest of this tent. Among the most remarkable are the maidenhair-ferns (*adiantum*), and a huge plant of the elk's horn fern, from New South Wales. It derives its name from the shape of its large fronds. Before us is a quantity of Chinese hydrangeas, remarkable in this case for the small size of the plants, and disproportionately large heads of pink blossoms. Cape pelargoniums, too, are well represented: they are curious plants, indigenous to the Cape of Good Hope; specimens of them are very often sent to this country, with boxes of bulbs, for which the Cape is famous. When they arrive, they look like pieces of deadwood; but when properly cared for, they rapidly make roots and branches, and produce their interesting flowers in abundance.

Passing to the next tent, we enter that part devoted to the fruit. A delicate aroma pervades the place. Directly before us is a large plant of the Chinese loquah, loaded with fruit. This is yellow, and about the size of a small plum. The plant is a great novelty; for although hardy enough to be grown out of doors in this country, it produces its fruit only in a hothouse. Associated with it are some large vines in pots, with a profusion of fine bunches of grapes. Then there are dishes of strawberries (*British Queens*), numerous pine-apples, cherries, peaches, bananas (grown in this country), melons, &c.; besides some very fine winter apples and pears, which have been admirably preserved. Of the former, the winter-queen, old green nonpareil, and golden harvey are conspicuous; of the latter, the warden and Uvedale's St Germain are fine.

The most attractive feature of these shows appears to be the orchideous or air-plants, as they are popularly known. A greater number of persons are always collected round them than in any other part of the tents; nor is this to be wondered at. Nothing can be more singular in appearance or gorgeous in colouring. Their fragrance, too, is so delightful. Description can convey but a faint idea of their great beauty and diversity of character. They seem to mimic the insect world in the shapes of their blossoms; nor are the resemblances distant. Every one has heard of the butterfly-plant: there is one on the stage now before us, and as the breeze gently waves its slender stalks, each tipped with a vegetable butterfly, it becomes almost difficult to imagine that we are not watching the movements of a real insect flitting among the plants. Here is a spike of *Gongora maculata*, bearing no faint resemblance to a quantity of brown insects with expanded wings collected round the stem. Close to it are some *Brassias*, mimicking with equal fidelity insects of a paler colour, besides hundreds of others equally curious and beautiful. Some bear their flowers in erect spikes, or loose heads; others have drooping racemes a yard in length, as some of the *dendrobiums*. More have a slender flower-stalk making a graceful curve, with the flowers placed on the uppermost side, as *Phalanopsis amabilis*, which bears a profusion of white blossoms closely resembling large moths with expanded wings. Here are some remarkable plants we must not pass without noticing: they are equally attractive both by their beauty and associations. They are two plants of *Stanhopea tigrina*, exhibited by Her Majesty, and a fine specimen of *Acineta Humboldtii*, named in honour of the philosophic traveller. They are all worthy of the associations they call up; they grow in open baskets, and the flowers are produced from below, directly opposite the leaves. The ordinary law of flowering-plants is reversed in them.

We pass on: everywhere gorgeous masses of flower are before us. Huge plants of Indian azaleas, filling a space of several feet, literally covered with blossoms of every hue. Heaths from the Cape, far outrivalling their brethren in their native wilds; rhododendrons

from the Himalaya; and cactuses from the plains of South America. In fact, here are collected examples of the flora of almost every known country of the globe. But we must not be carried away by these more showy plants to the exclusion of some very curious and interesting little things which I see we are in danger of forgetting. Here, carefully covered by a bell-glass, is a fine specimen of *Dionaea muscipula*, or Venus's fly-trap. Every reader of natural history is familiar with its economy; but one does not often get a sight of it. By the side of it are many other curious plants, covered with equal care. *Anacochillus argenteus*, a little dwarf plant, with leaves which, both in their beautiful lustre and peculiar markings, resemble a green lizard, must serve for an example. Among other curiosities, is a small plant of one of the species of rhododendrons, recently introduced by Dr Hooker from the mountains of Sikkim Himalaya; close to it are some azaleas imported from the northern parts of the Celestial Empire. There are also some very rare and valuable specimens of hardy trees, from the mountains of Patagonia. They belong to the very extensive family of coniferous plants, and have been named respectively *Fitz-Roya Patagonica* and *Saxe-Gotha conopsea*. There is also a remarkably handsome creeper, *Hexacentras mysorensis*, having pendent racemes of large flowers in shape resembling the snap-dragon, and of a rich orange and chocolate colour.

To revert to the little Sikkim rhododendron, I shall give here the description of a still more diminutive specimen, met with by Dr Hooker during his journey, and which he has figured and described in his beautiful work, *The Rhododendron of Sikkim-Himalaya*. It is called *R. nivale*, or snow-rhododendron. 'The hard, woody branches of this curious little species, as thick as a goose-quill, struggle along the ground for a foot or two, presenting brown tufts of vegetation where not half-a-dozen other plants can exist. The branches are densely interwoven, very harsh and woody, wholly depressed; whence the shrub, spreading horizontally, and barely raised two inches above the soil, becomes eminently typical of the arid, stern climate it inhabits. The latest to bloom, and earliest to mature its seeds, by far the smallest in foliage, and proportionally largest in flower, most lepidote in vesture, humble in stature, rigid in texture, deformed in habit, yet the most odoriferous, it may be recognised, even in the herbarium, as the production of the loftiest elevation on the surface of the globe—of the most excessive climate—of the joint influences of a scorching sun by day, and the keenest frost by night—of the greatest drought, followed in a few hours by a saturated atmosphere—of the balmy calm, alternating with the whirlwind of the Alps. For eight months of the year, it is buried under many feet of snow; for the remaining four, it is frequently snowed on and sunned in the same hour. During genial weather, when the sun heats the soil to 150 degrees, its perfumed foliage scents the air; whilst to snow-storm and frost it is insensible: blooming through all; expanding its little purple flowers to the day, and only closing them to wither after fertilisation has taken place. As the life of a moth may be indefinitely prolonged whilst its duties are unfulfilled, so the flower of this little mountaineer will remain open through days of fog and sleet, till a mild day facilitates the detachment of the pollen and the fecundation of the ovarium. This process is almost wholly the effect of winds; for though humblebees, and the "Blues" and "Fritillaries" (*Polyommatus* and *Argynnis*) amongst butterflies, do exist at this prodigious elevation, they are too few in number to influence the operations of vegetable life.' To this Dr Hooker adds: 'This singular little plant attains a loftier elevation, I believe, than any other shrub in the world.'

But here is a plant, or rather flower, more curious than any we have seen. The corolla is on a long

stalk, a foot or more high; but how to describe it is the difficulty. Imagine a bat with expanded wings, with the addition of a tail, spread out before you, having on its breast a rosette of narrow ribbon, of the same dusky colour, and you will gain some idea of its form and colour. Its botanical name is *Attacia cristata*.

Here is the rose-tent. In no previous season have the plants appeared in finer condition. A few years ago, nobody could grow roses fit to be seen in pots; many said it was impossible to do so: now, one can scarcely imagine anything finer than they are seen at the metropolitan flower-shows. Both in healthy appearance, and in fineness of flower, they exceed those which we admire so much in the open garden in summer. One or two are conspicuous, though all are beautiful. *Souvenirs d'un ami* has pale flesh-coloured flowers, exceedingly delicate; nor is the perfume they emit less attractive. *Niphetus*, pure white; *Adam*, very pale; and *Géant des Batailles*, of the richest crimson, are among the most attractive; but there are numerous others, rivalling them in beauty and fragrance.

As the afternoon wears away, the more fashionable visitors depart. At six o'clock, the several bands of music form one, the National Anthem is played, and the fête is over.

GOLD-SEEKING AT HOME.

THE Lomond Hills, in the shires of Fife and Kinross, were known in ancient times as the hunting-grounds of the kings of Scotland, when these monarchs resided in their summer-palace at Falkland, a village on their north-eastern declivity. At a period intermediate between these and the present times, they were the haunt of the persecuted Covenanters, and often resounded with the voice of psalms raised at conventicles. Since then, their solitude and silence have seldom been disturbed, save by the bark of the shepherd's dog, or the echoes caused by the blasting of rocks in the limestone quarries which run along their southern and western ridges. But during the month of May last, this solitude and silence were completely destroyed, by thousands of persons plying every kind of instrument upon them, from the ponderous crowbar and pickaxe, to the easily-wielded trowel and hammer, in search of gold, which they believed to be hidden in their recesses. The information on which they acted seemed to them to come from an authentic source, and to be confirmed by competent authority.

On the southern base of the hills, overlooking the far-famed Lochleven, lies the village of Kinnesswood, noted as the birthplace of the poet Michael Bruce. A native of this village entered the army, and there learned manners at war with good morals, which, after his discharge, brought upon him the vengeance of the law, and he was banished 'beyond seas.' His subsequent good-conduct, however, procured him 'a ticket-of-leave,' and he became servant to the commissariat for the convicts in Van Diemen's Land. In this capacity he had frequent opportunities of seeing the substance brought from the Bathurst 'diggings,' containing the gold which is now arriving in this country in such large quantities. It at once struck him that he had seen abundance of the same material in his native hills, when visiting the quarries in which several of his friends and acquaintances earned their livelihood. This impression he conveyed in a letter to his mother, who, as a matter of course, afforded the information to all to whom she had an opportunity of communicating it. The intelligence spread with the rapidity of an electric telegraph, and an excitement was produced such as is seen among

bees when their hive has received a sudden shock. The mountain pathways became immediately alive with human beings, and noises arose like the hum of a city heard at a distance during the busiest hours of the day. In the villages immediately adjoining the place of resort, the excitement was wholly confined to youngsters and idlers, who are ever ready to seize upon novelty and enter upon bustle; but further off, it extended to old and young, hale and infirm, asthmatic and long-winded, grave and gay, taught and untaught, respectable and disreputable, industrious and idle, till it reached a compass of twenty miles at least, extending not only to the Forth and Tay, but stretching inland from their opposite shores. In short, men who had never climbed a mountain all their lives before, though living in close proximity to one, were seen on its loftiest peaks, and toiling there with all the ardour of Cyclops.

Meanwhile, some of the less impulsive minds in the district, not altogether untouched by the prevailing mania, began to cast about for warrants to justify their appropriation of some of this much-coveted material, and assure their confidence that it was really gold. Memory, research, tradition, testimony, all came to their help. They recollected how their fathers had told them that the Laird of Lathrisk had wrought a lead-mine on the northern declivity of the East Law, which yielded also a considerable proportion of silver, and which was abandoned only because of the high tax government had put upon the latter metal. Then came the ready query: That since there is silver in these hills, why not also gold, seeing they frequently go together? Then it was found that the mineral formations in which this metal occurs are the crystalline primitive rocks; and with these the Lomond Hills were held to correspond. Then it had been told them, that in days of yore shepherds had found pieces of gold while tending their flocks on the hills, and that gold had been frequently met with in the whole district of country between the Forth and the Tay. Last of all came the testimony of a man who had returned to the neighbourhood from California, and who assured them, that the substance they submitted to his inspection was in all respects similar to that which was dug out of the hills in the gold regions of America. Singularly enough, though they did not reflect upon the facts, this man had returned home as poor as he had departed, and manifested no desire to accompany them to the new El Dorado at their doors. Other persons were meanwhile pushing inquiries in a more certain direction, and subjecting the supposed precious treasure to infallible tests.

The chief centre of attraction is a partially-wrought limestone quarry, known by the name of the Sheet-biehead, right above the village of Kinnesswood, and about a gunshot back from the brow of the Bishop Hill. It is surrounded on all sides by immense heaps of debris, which has been repeatedly dug into during the last thirty years by geologising students, in search of fossils connected with the carboniferous system, and who must have frequently met with the substance which has caused all this excitement, but never imagined it to be gold. The face of the quarry, to the depth of twenty feet from the top, is an accumulation of shale or slate, lying in regular layers, and easily broken. It has been turned to good account of late in the manufacture of slate-pencils of superior quality. Among this shaly accumulation, there are frequent layers of a soft, wet clay or ochre; and it is in this that the brilliants which have dazzled the imagination of so many are chiefly found, and which, accordingly, are frequently thrown out among the debris, of which it comes to form a part. In this quarry, then, and in the heaps around it, hundreds are earnestly busy in laying bare what is beneath; while scores of men, women, and children are silently and earnestly looking on.

One has just brought out a ball of stone, or something like stone, about the size of a man's hand, known among the quarrymen as 'a fairy ball'; it is composed of a hard crust, like rusted iron, which, on being broken, is found to contain a yellow shining metal of various shapes and sizes—grains, octohedrons, cubes, and their allied forms, as is the case with gold; and what else can it be but the precious metal, thinks the finder, as he places it in his receptacle, and applies himself anew to his vocation. In a little while he stumbles on another of these balls, as big as a man's hat, which he breaks, and opens with increasing eagerness; when, lo! it is as empty as a 'deaf nut'—the water which percolated through the shale having rusted the iron that goes to form the crust along with the ochre, but failed, as in the previous case, to form crystals in the interior. A third, fourth, and fifth are found to be as hollow as the last, and the 'digger' begins to look a little crestfallen, and abate his eagerness.

But here is an Irishman, who has been vastly more lucky, dancing a jig, with a footless stocking near him, tied at each end, packed as full as it can hold of 'the fine stuff,' as he calls it, while with wonderful agility he flourishes a heavy pickaxe and spade over his head, and screams at the highest pitch of his voice: 'Sure, now, and isn't my fortune made!' By and by, getting at once hoarse and tired, he desists from his exertions, and entreats a boy near him 'to go into the bog beyond there, and get him some poteen, which he is sure is making in the stills among the turf,' offering him at the same time a lump of his 'treasure' as payment for his trouble.

Here is a tall, grave, shrewd-looking man, very like an elder of the kirk, throwing away part of his accumulation, but somewhat stealthily retaining a portion in the large cotton handkerchief in which he had placed it, while a respectable-looking woman is saying to him: 'John, the minister says, it's no gold, but only brimstone.' To which he answers, with an audible sigh: 'Well hath the wise man said, all is vanity and vexation of spirit.' Here is a strong-built but lumpish-looking fellow, seemingly a ploughman or day-labourer, leaving the scene of action in evident disgust, who, on being asked if he had been successful, answers roughly: 'No!' and adds: 'I'll sell you this pick for a glass of ale or a dram of whisky.' Here are angry words passing between a middle-aged man and a youth, respecting the right of possession, the former having driven the latter away from a promising-looking place on which he was employed, and commenced operations upon it himself.

It is Saturday; and the mills on the river Leven are stopped at noon, to allow the water in the lake from which it flows to accumulate its supplies for the following week's operations. Freed thus from labour, the spinners hasten to the scene of attraction, and largely swell the crowd already assembled there. The men begin the search with eagerness, while the women content themselves with looking on; but it is evident that they are unaccustomed to the use of the instruments they have assumed, and that long practice will be necessary before they can turn them to much account. Here are bands of colliers able to wield them to purpose, yet how unwilling they appear to be to put forth their strength. They came in the expectation of getting gold for the lifting, which is nowhere the case; and are evidently disappointed in finding that both effort and perseverance are necessary. Indeed, it surprised us to see so little disposition to make and maintain exertion on the part of those who fancied that certain riches would be the result. Notwithstanding the numerous traces of picking, hammering, and shovelling they have left behind them, there is not an excavation a foot deep; while over a crevice in the rock, three inches square, 'a digger' has left the words, scratched with a piece of slate: 'There

is no gold here,' as if he had done all that was necessary to prove it. Even in the loose débris around the quarry—with which the substance referred to abounds—there is no trace of a digging wider or deeper than a man's hat. We have seen a student make greater and longer-continued exertion to get a fossil shell, and a terrier dog to get a rat or a rabbit, than any of the gold-seekers have. Burns the poet, in his lament, entitled *Man was made to Mourn*, complains, with more pathos and sentiment than truth and justice, that the landlords will not 'give him leave to toil.' That is not the leave most men desire, but the leave to be idle. If gold were to be got for the lifting, and bread were as easily procured as water, man would not be disposed to take healthful exercise, much less labour or toil.

We shall not describe the scene as it developed itself on Sunday. It was at total variance with the reputation Scotchmen have acquired for the observance of that day, but in perfect keeping with the notoriety they have gained for their love of strong drink. Monday was the fifteenth day of the gold-fever; and, like most other fevers, it was then at its height. Parties had been on the hill soon after the previous midnight awaiting the dawn, resolved to be the first at the diggings that morning, and 'have their fortunes made before others arrived.' But the lark had not got many yards high in his heavenward ascent, and only struck the first note of his morning-carol, when the mountain concaves sent back echoes of music from a whole band of men, marching at the head of a still greater number, who might have been taken for a regiment of sappers and miners. They have come from a distance; and, like the others who have preceded them, can have known little or nothing of 'balmy sleep, kind nature's sweet restorer,' unless they have taken it at church the preceding day, or in their beds, when they should have been there. The morning has grown apace, and shews the mountain-sides and table-land teeming with life. 'The cry is still, they come,' and long before mid-day, it is calculated that there are at least 1200 persons on the hill—many of them spectators of the scene, but most of them actors in it.

To a curious observer, it was at once an amusing, interesting, instructive, and painful spectacle. It developed character; shewed to some extent the state of society among certain classes and professions; and exhibited human nature in some of its peculiar and less agreeable phases. The most striking and unlikeable manifestations were—ignorance, credulity, superstition, recklessness, and disregard for all that is 'lovely and of good report.' We were particularly struck with the want of foresight, observation, and reflection shewn by a great number of the persons concerned, and of whom other things might have been expected. They had come to 'the diggings' without instruments of any kind with which to bring forth the supposed gold from its recesses; and, more wonderful still, without food to sustain them while employed in finding it. What an easy prey these persons would have been to any one willing to take advantage of them! They willingly parted with much of their supposed treasure for a few crumbs of cake from a boy's pocket, and with still more for a slice of poor cheese from a quarryman's wallet. The man who brought intoxicating drink to them, would have received in return whatever he would have been pleased to demand. One party, and one only, so far as we could learn, was more provident than the rest, having provisions with it equal to its necessities for one day at least, among which whisky held a prominent place.

The substance found and supposed to be gold is very similar to that found in the coal-mines and iron-bands of Fife, which are known to 'crop out' in the Lomond Hills—none being found further north—yet the colliers and miners did not identify the substance when found

in other circumstances than those in which they are accustomed to meet with it. The inhabitants of the district in which it is found shewed little sympathy with the excitement produced, a fact which should have led the gold-hunters to pause and ponder; for they were as likely to know the nature of the substance sought as persons at a distance, and just as likely to appropriate it, if it really were gold. But under the influence of their credulity, our adventurers drew a conclusion quite different—namely, that the people at the foot of the hill affected indifference, in order to deceive those at a distance, and keep all the treasure to themselves. It was of no use to tell them, that this said gold had been tested half a century ago, and been 'found wanting.' They wished it to be gold, and they were determined to believe it such. Much advantage was taken of this credulity, even by those who had themselves been its dupes. The most daring falsehoods were invented by them, in order to induce others to befooled themselves as they had done. One, according to his own account, had received 80s. for his 'findings,' and another had been offered L.2 for as much as he had collected in half an hour. Such are specimens of the fables they devised, with a view to deceive their acquaintances, and they had manifest pleasure in seeing them produce the desired effect.

Meanwhile, every test known to or conceivable by the amateur chemists—of which there are not few in the counties in which the hills are situated—was put in requisition, and a voice evoked by them, but it would not speak as desired. Others, who knew nothing of chemistry, were torturing it in every possible way—beating it with hammers, to see if it would expand, like gold, into leaf; but instead of this, it only flew off in splinters: then putting it into the smith's forge, to see if it would liquefy and separate from the dross, but it only evaporated in fumes, which drove them from the smithy by their offensive odour. Not one of these experimenters, whether more or less skilled, thought of subjecting it to the simple and certain test of cutting it with a knife, of which the substance in question is not susceptible, whereas gold cuts like tough cheese. Enough, however, had been done to confirm suspicions which had been floating in the minds of many of the diggers, that this rapid wealth-finding was a delusion and a lie. All doubts upon the subject were finally set at rest by the professors of mineralogy in the colleges, and the practical chemists in Edinburgh and Glasgow, informing certain inquirers as to the real nature of this deceptive substance. It is of two kinds: the one with a gray, the other with a brown base—the latter much more common than the former; the one shining with a whitish, the other, with a yellowish lustre. The one is *galena*, a sulphuret of lead; the other, *pyrites*, a sulphuret of iron. These pyrites are very extensively diffused, and are said to be worth about L.2 a ton. Pity it is that even this trifle should be lost to the poor quarryman, who has only to lay them aside when wheeling away his rubbish till they accumulate to such a quantity as to be worth a purchaser's notice, but who does not know where to find a customer.

The Lomonds were now again left to their solitude and silence, a few stray persons visiting them only from curiosity, to see the place and its productions which had caused such excitement. But the mania did not abate all at once. A village patriarch, skilled in fairy lore, entertained some of the gold-seekers with the following legend, which had the effect of sending them in search of the precious metal elsewhere. According to this ancient, a fairy, in times long gone by, appeared on a summer gloaming to a boy herding cattle in the place indicated by the following doggerel, and told him that—

If Auchindownie cock does not crow,
If Balmaln horn does not blaw,
I'll shew you the gold in *Largo Lare*.

'But,' added this benevolent son of Puck, 'if I leave you when these happen—for I must then return home immediately—take you notice where the brindled ox lies down, and there you will find the gold.' The cock crew and the horn blew. The fairy vanished, but the boy observed where the brindled ox lay down; but then he did not reflect upon the need of marking the place, but ran home, in his impatience to communicate the delightful information he had received, and on his return found that the brindled ox had risen and left the place; and as he could not determine the spot, the gold still awaits the search of some more reflective and painstaking person. Of course, one and another of the narrator's auditors thought himself such a person, and hid him away to the conical hill that rises so conspicuously at the entrance to the estuary of the Forth. What success attended them there we have not the means of knowing, but we have seen it stated in a local newspaper, that a specimen of the shining substance found in that place had been sent to the editor, and he pronounces it more like gold than the crystals brought him from the Lomond Hills. But 'like,' says the proverb, 'is an ill mark;' and we hope the gold-diggers of Fife will consider themselves as having been already sufficiently deceived by appearances.

The mania lasted fully three weeks, not that any one person was under its influence all that time—for, singularly enough, the man who had been once there rarely if ever returned—but, like an epidemic, it spread wide, and only ceased by a change in the intellectual atmosphere. There could not be less than 300 persons upon an average each day upon the hill, either searching for the supposed treasure, or waiting to ascertain the result from those that did. This would make an aggregate of 6300 in the whole time; but let us keep much within the mark, and take the number convened during that period at 5000. Many of these were men earning 15s. a week; but let us put them all down at 1s. 6d per day each, and allow 1s. for the expense incurred in their going to and from the place. This will make half-a-crown lost and expended by every one of them. This calculation makes L.30 a day, and L.680 for the whole period. Now, we are fully persuaded, that though all the pyrites carried off had been gold in the proportion in which it seemed in the substance, it would not have realised this sum, which is about the price of 200 ounces of gold; so that, in the aggregate, the diggers would have been losers, though some of them individually might have been gainers. But the gainers would have been few in proportion to the whole, for we observed that not more than one man in twenty found even the pyrites, which are probably still more extensively diffused than gold itself ever is, even in the regions where it is now known to prevail: so that the wages of the nineteen unsuccessful men are to be calculated along with those of the successful one; and then it follows, that unless the 'findings' of the latter at the close of the day are equal to the wages of twenty men, there is no increase of capital to the country, no gain upon the whole. Then the man who was lucky at one time, was unlucky at another—like a poacher who snares three hares in a night, but does not snare another for a week, while he has been unable to work during the day, and, in the end, his losses have counterbalanced his gains. Then if this phantom had proved a reality, all the mines and mills within a wide range of the place would have been instantly abandoned, and it must have taken a long time, indeed, to reproduce the capital thus lost to the country. In fine, it must have become necessary to fix a rent upon the diggings, in order to constitute a right to labour in them; and still further, to levy a tax to provide a police, if not a military force, to preserve order; and after these deductions are made, together with the incomes derived from previous occupations, and the great uncertainty connected with the vocation

—to say nothing of the labour and discomforts to be endured—we cannot think gold-digging a profitable or desirable pursuit.

COMPETITION AND MONOPOLY.

A MEMORANDUM just issued by that active body, the Sanitary Association, contains the following amusing and instructive account of the memorable competition between the great London water-companies forty years ago, and of the close monopoly in which that reckless and ruinous struggle ended:—

'In 1810, a water mania, like our recent railway mania, suddenly broke out; and the principle of competition, to which the legislature had all along looked for the protection of the public, was put upon its trial. Two powerful companies, which had been several years occupied in obtaining their acts and setting up their machinery, now took the field—one, the West Middlesex, attacking the old monopolists on their western flank; the other, the East London, invading their territory from the opposite quarter. At the same time, a band of dashing Manchester speculators started the Grand Junction Company with a flaming prospectus, and boldly flung their pipes into the very thick of the tangled net-work which now spread in every direction beneath the pavement of the hotly-contested streets.

'These Grand-Junction men quite astonished the town by the magnificence of their promises. "Copious streams" of water, derived by the medium of the Grand Junction Canal; from the rivers Colne and Brent: "always pure and fresh, because always coming in"—"high service, free of extra charge;" above all, "unintermittent supply, so that customers may do without cisterns;" such were a few of the seductive allurements held out by these interlopers to tempt deserters from the enemy's camp.

'The West Middlesex Company, in its opening circulars, also promised "unlimited supplies" to the very "house-tops," of water "clear and bright from the gravelly bottom of the Thames, thirteen miles above London Bridge." The East London was not behindhand with the trumpet; and its "skilful" directors, by paying dividends in rapid succession out of capital, raised their L.100 shares to the enormous premium of L.180 before they had well got their machinery into play. Meanwhile the South London (or Vauxhall) Company was started—in 1805—on the other side of the river, with a view to wrest from its old rulers the watery dominion of the south. The war was not, however, carried on in a very royal sort; for, as the travelling mountebank drives six-in-hand through a country town to entice the gaping provincials to his booth, so these water-jugglers went round the streets of London, throwing up rival *jets-d'eau* from their mains, to prove the alleged superiority of their engines, and to captivate the fancy of hesitating customers.

'The New River Company, thus put upon its mettle, boldly took up the gauntlet. It erected new forcing-engines, changed its remaining wooden pipes for iron, more than doubled its consumption of coal, reduced its charges, augmented its supplies, issued a contemptuous rejoinder to its adversaries, and, appealing as an "old servant" to the public for support, engaged in a war of extermination.

'For seven years, the battle raged incessantly. The combatants sought—and openly avowed it—not their own profit, but their rivals' ruin. Tenants were taken on almost any terms. Plumbers were bribed to *tout*, like omnibus cads, for custom. Such was the rage for mere numerical conquest, that a line of pipes would be often driven down a long street, to serve one new customer at the end. Arrears remained uncollected, lest offence should be given and influence impaired. Capricious tenants amused themselves by changing from one main to another, as they might taste this or that tap of beer. The more credulous citizens, relying on the good faith of the "public servants"—as these once powerful water-lords now humbly called themselves—were simpletons enough, on the strength of their promises, to abandon their wells, to sell off their force-pumps, and to erect water-closets or baths in the upper storeys of their houses. In many streets, there were three lines of pipes laid down, involving triple leakage, triple interest on capital,

triple administrative charges, triple pumping and storage costs, and a triple army of turncocks—the whole affording a less effective supply than would have resulted from a single well-ordered service. In this desperate struggle vast sums of money were sunk. The recently-established companies worked at a ruinous loss; and such as kept up a show of prosperity were, in fact, like the East London Company, paying dividends out of capital. The New River Company's dividends went down from L.500 to L.23 per share per annum. In the border-line districts, where the fiercest conflicts took place, the inhabitants sided with one or other of the contending parties. Some noted with delight the humbled tone of the old arbitrary monopolists, and heartily backed the invaders. Some old-stagers stuck to the ancient companies, and to the faces of familiar turncocks. These paid; but many shrewd fellows put off the obsequious collectors, and contrived to live water-rate free. Thus the honest, as usual, paid for the knaves; and the ultimate burden of all these squandered resources fell—also as usual—on society at large.

'Such a state of things could not last; and it came to a conclusion which experience, had it been invoked, might have led parliament to anticipate. For, scarcely a century before, the two chartered East India Companies, after five years' internecine war, had coalesced to form that gigantic confederacy which for years monopolised the Indian trade, and rose to an unexampled pitch of corporate power and aggrandisement, at the cost of the mercantile community.

'Just so, in 1817, the great water-companies coalesced against the public, and coolly portioned out London between them. Their treatment, on this occasion, of the tenants so lately flattered and cajoled, will never be effaced from the public memory. Batches of customers were handed over by one water-company to another, not merely without their consent, but without even the civility of a notice. Old tenants of the New River Company, who had taken their water for years, and had been their thick-and-thin supporters through the battle, found themselves ungratefully turned over, without previous explanation, to drink the "puddle" supplied by the Grand Junction Company. The abated rates were immediately raised, not merely to the former amount, but to charges from 25 to 400 per cent. more than they had been before the competition. The solemnly-promised high service was suppressed, or made the pretext for a heavy extra charge. Many people had to regret "selling their force-pumps as old lead," or fixing water-closets on their upper floors, on the faith of these treacherous contractors. Those who had fitted up their houses with pipes, in reliance on the guarantee of *uninterrupting pressure*, found themselves obliged either to sacrifice the first outlay, or to expend on cisterns and their appendages further sums, varying from L.10 or L.20 up to L.50—and even, in many cases, L.100. When tenants thus unhandsonly dealt by expressed their indignation, and demanded redress, they were "jocosely" reminded by smiling secretaries that the competition was over, and that those who were dissatisfied with the companies' supplies were quite at liberty to set up pumps of their own.

'Thus as, in political affairs, anarchy invariably leads to despotism, so, in commerce, subversive competition always ends its disorderly and ruinous course in monopoly, which, whether avowed or tacit, individual or collective, is but despotism in a lower sphere.

'The cure for these evils lies in the competitive contract-system, which brings competition to bear *for*, instead of *in*, the field of supply, so as to obviate the reckless multiplication of establishments, and capitals, and staffs, for the performance of a service for which one would suffice. Evidence shews that the water-companies might be bought out, so as to clear the way for the consolidation of the water-supply with the drainage and other connected sanitary services, under a public authority, responsible to the rate-payers through parliament, and charged to supervise the due execution of the works by contractors competing freely, on open tender, in the public market—a system obviously calculated to secure for the public the best possible service at the lowest possible rates. By empowering such an authority to buy the companies out in full, with money borrowed at 3 or 3½

per cent., we should come into possession of their works at an annual charge for interest, less, by nearly two-fifths, than our present annual payment to the companies; by consolidating the nine establishments thus acquired, we should save more than half the present working costs; and by the further consolidations referred to above, for which this first one would prepare the ground, we should still more reduce our annual charges, and still more improve our sanitary condition.'

MICHAEL THE ARCHANGEL:

A STATUETTE.

My white archangel, with thy steady eyes
Outlooking on this silent, ghost-filled room,
Thy clasped hands wrapped on thy sheathed sword or
doom,

Thy firm-closed lips, not made for human sighs,
Kisses, or smiles, or writhing agonies,
But for divine exhorting, heavenly song,
Bold, righteous counsel, sweet from seraph tongue—
Beautiful angel, strong as thou art wise,
Would that thy sight could make me wise and strong!
Would that this sword of thine, which idle lies
Stone-planted, could wake up and gleam among
The crowd of demons that with eager cries
Howl in my heart temptations of world's wrong!
Lama Sabacithani! How long—how long!

Michael, great leader of the hosts of God,
Warrer with Satan for the body of him
Whom living, God had loved—If cherubim
With cherubim contend for one poor clod
Of human dust, with sin-stained feet that trod
Through the wide deserts of Heaven's chastisement—
Are there not ministering angels sent
To strive with evil ones that roam abroad
Clutching our living souls? 'The living, still
The living, they shall praise Thee.' Let some great
Invisible spirit enter in and fill
The howling chambers of hearts desolate,
There stand like thee, O Michael, strong and wise,
My white archangel with the steadfast eyes!

WAGES HEIGHTENED IN CONSEQUENCE OF IMPROVEMENT OF MACHINERY.

It is stated in a report of the Commissioners appointed in 1832 to inquire concerning the employment of women and children in factories, that 'in the cotton-mill of Messrs Houldsworth, in Glasgow, a spinner employed on a mule of 336 spindles, and spinning cotton 120 hanks to the pound, produced in 1823, working 74½ hours a week, 46 pounds of yarn, his net weekly wages for which amounted to 27s. 7d. Ten years later, the rate of wages having in the meantime been reduced 13 per cent., and the time of working having been lessened to 69 hours, the spinner was enabled by the greater perfection of the machinery to produce on a mule of the same number of spindles, 54½ pounds of yarn of the same fineness, and his net weekly earnings were advanced from 27s. 7d. to 29s. 10d.' Similar results from similar circumstances were experienced in the Manchester factories. The cheapening of the article produced by help of machinery increases the demand for the article; and there being consequently a need for an increased number of workmen, the elevation of wages follows as a matter of course. Nor is this the only benefit which the working-man derives in the case, for he shares with the community in acquiring a greater command over the necessities which machinery is concerned in producing.—Condensed from a Lecture by G. R. Porter to the *Woolworth Literary and Scientific Association*.

Printed and Published by W. and R. CHAMBERS, High Street
Edinburgh. Also sold by W. S. ORR, Amen Corner, London; J. N. CHAMBERS, 55 West Nile Street, Glasgow; and J. H. GILBERT, 50 Upper Sackville Street, Dublin.—Advertisements for *Monthly Parts* are requested to be sent to MAXWELL & CO., 31 Nicholas Lane, Lombard Street, London, to whom all applications respecting their insertion must be made.

SATURDAY, JULY 31, 1852.

PRICE 1½d.

BOOK-WORSHIP.

A book belongs in a peculiar manner to the age and nation that produce it. It is an emanation of the thought of the time; and if it survive to an after-time, it remains as a landmark of the progress of the imagination or the intellect. Some books do even more than this: they press forward to the future age, and make appeals to its maturer genius; but in so doing they still belong to their own—they still wear the garb which stamps them as appertaining to a particular epoch. Of that epoch, it is true, they are, intellectually, the flower and chief; they are the expression of its finer spirit, and serve as a link between the two generations of the past and the future; but of that future—so much changed in habits, and feelings, and knowledge—they can never, even when acting as guides and teachers, form an essential part: there is always some bond of sympathy wanting.

A single glance at our own great books will illustrate this—books which are constantly reprinted, without which no library can be tolerated—which are still, generation after generation, the objects of the national worship, and are popularly supposed to afford a universal and unfailing standard of excellence in the various departments of literature. These books, although pored over as a task and a study by the few, are rarely opened and never read by the many: they are known the least by those who reverence them most. They are, in short, idols, and their worship is not a faith, but a superstition. This kind of belief is not shaken even by experience. When a devourer of the novels of Scott, for instance, takes up *Tom Jones*, he, after a vain attempt to read, may lay it down with a feeling of surprise and dissatisfaction; but *Tom Jones* remains still to his convictions 'an epic in prose,' the fiction *par excellence* of the language. As for *Clarissa Harlowe* and *Sir Charles Grandison*, we have not heard of any common reader in our generation who has had the hardihood even to open the volumes; but Richardson as well as Fielding retains his original place among the gods of romance; and we find Scott himself one of the high-priests of the worship. When wandering once upon the continent, we were thrown for several days into the company of an English clergyman, who had provided himself, as the best possible model in description, with a copy of Spenser; and it was curious to observe the pertinacity with which, from time to time, he drew forth his treasure, and the weariness with which in a few minutes he returned it to his pocket. Yet our reverend friend, we have no doubt, went home with his faith in Spenser unshaken, and recommends it to this day as the most delightful of all companions for a journey.

In the present century, the French and German critics have begun to place this reverential feeling for the 'classics' of a language upon a more rational basis. In estimating an author, they throw themselves back into the times in which he wrote; they determine his place among the spirits of his own age; and ascertain the practical influence his works have exercised over those of succeeding generations. In short, they judge him relatively, not absolutely; and thus convert an unreasoning superstition into a sober faith. We do not require to be told that in every book destined to survive its author, there are here and there gleams of nature that belong to all time; but the body of the work is after the fashion of the age that produced it; and he who is unacquainted with the thought of that age, will always judge amiss. In England, we are still in the bonds of the last century, and it is surprising what an amount of affectation mingles with criticism even of the highest pretensions. It is no wonder, then, that common readers should be mistaken in their book-worship. To such persons, for all their blind reverence, Dante must in reality be a wild beast—a fine animal, it is true, but still a wild beast—and our own Milton a polemical pedant arguing by the light of poetry. To such readers, the spectacle of Ugolino devouring the head of Ruggieri, and wiping his jaws with the hair that he might tell his story, cannot fail to give a feeling of horror and disgust, which even the glorious wings of Dante's angels—the most sublime of all such creations—would fail to chase away. The poetry of the Divine Comedy belongs to nature; its superstition, intolerance, and fanaticism, to the thirteenth century. These last have either passed away from the modern world or they exist in new forms, and with the first alone can we have any real healthy sympathy.

One of our literary idols is Shakspeare—perhaps the greatest of them all; but although the most universal of poets, his works, taken in the mass, belong to the age of Queen Elizabeth, not to ours. A critic has well said, that if Shakspeare were now living, he would manifest the same dramatic power, but under different forms; and his taste, his knowledge, and his beliefs would all be different. This, however, is not the opinion of the book-worshippers: it is not the poetry alone of Shakspeare, but the work bodily, which is pre-eminent with them; not that which is universal in his genius, but that likewise which is restricted by the fetters of time and country. The commentators, in the same way, find it their business to bring up his shortcomings to his ideal character, not to account for their existence by the manners and prejudices of his age, or the literary models on which his taste was formed. It would be easy to run over, in this way, the list of all

our great authors, and to shew that book-worship, as contradistinguished from a wise and discriminating respect, is nothing more than a vulgar superstition.

We are the more inclined to put forth these ideas, at a time when reprints are the order of the day—when speculators, with a singular blindness, are ready to take hold of almost anything that comes in their way without the expense of copyright. It would be far more judicious to employ persons of a correct and elegant taste to separate the local and temporary from the universal and immortal part of our classics, and give us, in an independent form, what belongs to ourselves and to all time. A movement was made some years ago in this direction by Mr Craik, who printed in one of Charles Knight's publications a summary of the *Fairy Queen*, converting the prosaic portions into prose, and giving only the true poetry in the rich and musical verses of Spenser. A travelling companion like this, we venture to assure our clerical friend, would not be pocketed so wearily as the original work. The harmony of the divine poet would saturate his heart and beam from his eyes; and when wandering where we met him, among the storied ruins of the Rhine, he would have by his side not the man Spenser, surrounded by the prejudices and rudenesses of his age, but the spirit Spenser, discoursing to and with the universal heart of nature. Leigh Hunt, with more originality—more of the quality men call genius, but a less correct perception of what is really wanted—has done the same thing for the great Italian poets; and in his sparkling pages Dante, Ariosto, Tasso, and the rest of the tuneful train, appear unfettered by the more displeasing peculiarities of their mortal time. But the criticism by which their steps are attended, though full of grace and acuteness, is absolute, not relative. They are judged by a standard of taste and feeling existing in the author's mind: the *Inferno* is a magnificent caldron of everything base and detestable in human nature; and the *Orlando*, a paradise of love, beauty, and delight. Dante, the sublime poet, but inexorable bigot, meets with little tolerance from Leigh Hunt; while Ariosto, exhaustless in his wealth, ardent and exulting—full of the same excess of life which in youth sends the blood dancing and boiling through the veins—has his warmest sympathy. This kind of criticism is but a new form of the error we have pointed out; for both poets receive his homage—the one praised in the spontaneous outpourings of his heart, the other served with the rites of devil-worship.

When we talk of the great authors of one generation pressing forward to claim the sympathy of the maturer genius of the next, we mean precisely what we say. We are well aware that some of the great writers we have casually mentioned have no equals in the present world; yet the present world is more mature in point of taste than their own. That is the reason why they are great authors now. Some books last for a season, some for a generation, some for an age, or two, or more; always dropping off when the time they reach outstrips them. One of these lost treasures is sometimes reprinted; but if this is done in the hope of a renewed popularity, the speculation is sure to fail. Curious and studious men, it is true, are gratified by the reproduction; but the general reader would prefer a book of his own generation, using the former as materials, and separating its immortal part from its perishing body.

And the general reader, be it remembered, is virtually the age. It is for him the studious think, the imaginative invent, the tuneful sing: beyond him there is no appeal but to the future. He is superstitious, as we have seen, but his gods are few and traditional. He determines to make a stand somewhere; and it is necessary for him to do so, if he would not encumber his literary Olympus with a Hindoo-like pantheon of millions. But how voracious is this general reader in regard to the effusions of his own day! What will become of the myriads of books that

have passed through our own unworthy hands? How many of them will survive to the next generation? How many will continue to float still further down the stream of time? How many will attain the honour of the apotheosis? And will they coexist in this exalted state with the old objects of worship? This last is a pregnant question; for each generation will in all probability furnish its quota of the great books of the language, and, if so, a reform in the superstition we have exposed is no longer a matter of mere expedience, but of necessity. We are aware that all this will be pronounced rank heresy by those who assume the style of critics, who usually make a prodigious outcry when a great author is mutilated, even by expunging a word which modern decency excludes from the vocabulary of social and family intercourse. This word, however—supposing it to represent the mortal and perishing part of an author's productions—belongs not to him, but to his age; not to the intellectual man, but to the external and fleeting manners of his day and generation. Such critics usually take credit to themselves for a peculiarly large and liberal spirit; but there seems to us, on the contrary, to be something mean and restricted in views that regard the man as an individual, not as a portion of the genius which belongs to the world. Yet, even as an individual, the man is safe in his entirety, for there is no project of cancelling the printed works extant in our libraries, public and private. The true question simply is: Are great authors to be allowed to become practically obsolete—and many of them have become so already—while we stand upon the delicacies and ceremonies of Book-worship?

OUR TERRACE.

LONDON has been often compared to a wilderness—a wilderness of brick, and so in one sense it is; because you may live in London all the days of your life if you choose—and, indeed, if you don't choose, if you happen to be very poor—without exciting observation, or provoking any further questioning than is comprised in a demand for accurate guidance from one place to another, a demand which might be made upon you in an Arabian desert, if there you chanced to meet a stranger. But London is something else besides a wilderness—indeed it is everything else. It is a great world, containing a thousand little worlds in its bosom; and pop yourself down in it in any quarter you will, you are sure to find yourself in the centre of some peculiar microcosm distinguished from all others by features more or less characteristic.

One such little world we have lived in for a round number of years; and as we imagine it presents a picture by no means disagreeable to look upon, we will introduce the reader, with his permission, into its very limited circle, and chronicle its history for one day as faithfully as it is possible for anything to do, short of the Daguerreotype and the tax-gatherer. Our Terrace, then—for that is our little world—is situated in one of the northern, southern, eastern, or western suburbs—we have reasons for not being particular—at the distance of two miles and three-quarters from the black dome of St Paul's. It consists of thirty genteel-looking second-rate houses, standing upon a veritable terrace, at least three feet above the level of the carriage-way, and having small gardens enclosed in iron palisades in front of them. The gardens open upon a pavement of nine feet in width; the carriage-road is thirty feet across; and on the opposite side is another but lower terrace, surmounted with handsome semi-detached villas, with ample flower-gardens both in front and rear, those in the front being planted, but rather sparingly, with lime, birches, and a few specimens of the white-ash, which in summer-time overshadow the pavement, and shelter a passing pedestrian when caught in a shower. At one end

of Our Terrace, there is a respectable butcher's shop, a public-house, and a shop which is perpetually changing owners, and making desperate attempts to establish itself as something or other, without any particular partiality for any particular line of business. It has been by turns a print-shop, a stationer's, a circulating library, a toy-shop, a Berlin-wool shop, a music and musical-instrument shop, a haberdasher's shop, a snuff and cigar shop, and one other thing which has escaped our memory—and all within the last seven years. Each retiring speculator has left his stock-in-trade, along with the good-will, to his successor; and at the present moment it is a combination of shops, where everything you don't want is to be found in a state of dilapidation, together with a very hungry-looking proprietor, who, for want of customers upon whom to exercise his ingenuity, pulls away all day long upon the accordion to the tune of *We're a' soddin'*. The other end of Our Terrace has its butcher, its public-house, its grocer, and a small furniture-shop, doing a small trade, under the charge of a very small boy. Let thus much suffice for the physiology of our subject. We proceed to record its history, as it may be read by any one of the inhabitants who chooses to spend the waking hours of a single day in perusing it from his parlour window.

It is a fine morning in the middle of June, and the clock of the church at the end of the road is about striking seven, when the parlour shutters and the street doors of the terrace begin to open one by one. By a quarter past, the servant-girls, having lighted their fires, and put the kettle on to boil for breakfast, are ostensibly busy in sweeping the pathways of the small front-gardens, but are actually enjoying a simultaneous gossip together over the garden railings—a fleeting pleasure, which must be nipped in the bud, because master goes to town at half-past eight, and his boots are not yet cleaned, or his breakfast prepared. Now the bedroom-bell rings, which means hot water; and this is no sooner up, than mistress is down, and breakfast is laid in the parlour. At a quarter before eight, the eggs are boiled, and the bacon toasted, and the first serious business of the day is in course of transaction. Mr Jones of No. 9, Mr Robinson of No. 10, and Mr Brown of No. 11, are bound to be at their several posts in the city at nine o'clock; and having swallowed a hasty breakfast, they may be seen, before half-past eight has chimed, walking up and down the terrace chatting together, and wondering whether 'that Smith,' as usual, means to keep the omnibus waiting this morning, or whether he will come forth in time. Precisely as the half hour strikes, the tin horn of the omnibus sounds its shrill blast, and the vehicle is seen rattling round the corner, stopping one moment at No. 28, to take up Mr Johnson. On it comes, with a fresh blast, to where the commercial trio are waiting for it; out rushes Smith, wiping his mouth, and the 'bus,' swallowing up the whole four, rumbles and trumpets on to take up Thompson, Jackson, and Richardson, who, cigars in mouth, are waiting at a distance of forty paces off to ascend the roof. An hour later, a second omnibus comes by on the same benevolent errand, for the accommodation of those gentlemen, more favoured by fortune, who are not expected to be at the post of business until the hour of ten. As Our Terrace does not stand in a direct omnibus route, these are all the 'buses' that will pass in the course of the day. The gentlemen whom they convey every morning to town are regular customers, and the vehicles diverge from their regular course in order to pick them up at their own doors.

About half-past nine, or from that to a quarter to ten, comes the postman with his first delivery of letters for the day. Our Terrace is the most toilsome part of his beat, for having to serve both sides of the way, his

progress is very like that of a ship at sea sailing against the wind. R'tat he goes on our side, then down he jumps into the road—B'bang on the other side—tacks about again, and serves the terrace—off again, and serves the villas, and so on till he has fairly epistolised both sides of the way, and vanished round the corner. The vision of his gold band and red collar is anxiously looked for in the morning by many a fair face, which a watchful observer may see furtively peering through the drawing-room window-curtains. After he has departed, and the well-to-do merchants and employers who reside in the villas opposite have had time to look over their correspondence, come sundry neat turn-outs from the stables and coach-houses in the rear of the villas: a light, high gig, drawn by a frisky grey, into which leaps young Oversea the slipbroker—a comfortable, cushioned four-wheel drawn by a pair of bay ponies, into which old Discount climbs heavily, followed perhaps by his two daughters, bound on a shopping-visit to the city—and a spicy-looking, rattling trap, with a pawing horse, which has a decided objection to standing still, for Mr Goadall, the wealthy cattle-drover. These, with other vehicles of less note, all roll off the ground by a quarter after ten o'clock or so; and the ladies and their servants, with some few exceptions, are left in undisputed possession of home, while not a footfall of man or beast is heard in the sunshiny quiet of the street.

The quiet, however, is broken before long by a peculiar and suggestive cry. We do not hear it yet ourselves, but Stalker, our black cat and familiar, has caught the well-known accents, and with a characteristic crooning noise, and a stiff, perpendicular erection of tail, he sidles towards the door, demanding, as plainly as possible, to be let out. Yes, it is the cats-meat man. 'Ca' me-e-et—me-yet—me-e-yet!' fills the morning air, and arouses exactly thirty responsive feline voices—for there is a cat to every house—and points thirty aspiring tails to the zenith. As many hungry tabbies, sables, and tortoise-shells as can get out of doors, are trooping together with arched backs upon the pavement, following the little pony-cart, the cats' commissariat equipage, and each one, anxious for his daily allowance, contributing most musically his quota to the general concert. We do not know how it is, but the cats-meat man is the most unerring and punctual of all those peripatetic functionaries who undertake to cater for the consumption of the public. The baker, the butcher, the grocer, the buttermilk, the fishmonger, and the coster, occasionally forget your necessities, or omit to call for your orders—the cats-meat man never. Other traders, too, dispense their stock by a sliding-scale, and are sometimes out of stock altogether: Pussy's provider, on the contrary, sticks to one price from year's end to year's end, and never, in the memory of the oldest Grimalkin, was known to disappoint a customer. A half-penny for a cat's breakfast has been the regulation-price ever since the horses of the metropolis began to submit to the boiling process for the benefit of the feline race.

By the time the cats have retired to growl over their allowance in private, the daily succession of nomadic industrials begin to lift up their voices, and to defile slowly along Our Terrace, stopping now and then to execute a job or effect a sale when an opportunity presents itself. Our limits will not allow us to notice them all, but we must devote a few paragraphs to those without whom our picture would be incomplete.

First comes an ingenious lass of two or three-and-twenty, with a flaming red shawl, pink ribbons in her bonnet, and the hue of health on a rather saucy face. She carries a large basket on her left arm, and in her right hand she displays to general admiration a gorgeous group of flowers, fashioned twice the size of life, from tissue-paper of various colours. She lifts up her voice occasionally as she marches slowly along, singing, in a clear accent: 'Flowers—ornamental papers for the stove

—flowers! paper-flowers!’ She is the accredited herald of summer—a phenomenon, this year, of very late appearance. We should have seen her six weeks ago, if the summer had not declined to appear at the usual season. She is the gaudy, party-coloured ephemera of street commerce, and will disappear from view in a fortnight’s time, to be seen no more until the opening summer of ’53. Her wares, which are manufactured with much taste, and with an eye to the harmony of colours, are in much request among the genteel housewives of the suburbs. They are exceedingly cheap, considering the skill which must be applied in their construction. They are all the work of her own hands, and have occupied her time and swallowed up her capital for some months past. She enjoys almost a monopoly in her art, and is not to be beaten down in the price of her goods. She knows their value, and is more independent than an artist dares to be in the presence of a patron. Her productions are a pleasant summer substitute for the cheerful fire of winter; and it is perhaps well for her that, before the close of autumn, the faded hues of the flowers, and the harbour they afford to dust, will convert them into waste paper, in spite of all the care that may be taken to preserve them.

Paper Poll, as the servants call her, is hardly out of sight, and not out of hearing, when a young fellow and his wife come clattering along the pavement, appealing to all who may require their good offices in the matter of chair-mending. The man is built up in a sort of cage-work of chairs stuck about his head and shoulders, and his dirty phiz is only half visible through a kind of grill of legs and cross-bars. These are partly commissions which, having executed at home, he is carrying to their several owners. But as everybody does not choose to trust him away with property, he is ready to execute orders on the spot; and to this end his wife accompanies him on his rounds. She is loaded with a small bag of tools suspended at her waist, and a plentiful stock of split-cane under one arm. He will weave a new cane-seat to an old chair for 9d., and he will set down his load and do it before your eyes in your own garden, if you prefer that to intrusting him with it; that is, he will make the bargain, and his wife will weave the seat under his supervision, unless there happen to be two to be repaired, when husband and wife will work together. We have noticed that it is a very silent operation, that of weaving chair-bottoms; and that though the couple may be seated for an hour and more together rapidly plying the flexible canes, they never exchange a word with each other till the task is accomplished. Sometimes the wife is left at a customer’s door working alone, while the husband wanders further on in search of other employment, returning by the time she has finished her task. But there are no chairs to mend this morning on Our Terrace, and our bamboo friends may jog on their way.

Now resounds from a distance the cry of ‘All a-blowin’ an’ a-blowin’—all a-blowin’, a-blowin’ here!’ and in a few minutes the travelling florist makes his appearance, driving before him a broad-surfaced hand-cart, loaded in profusion with exquisite flowers of all hues, in full bloom, and, to all appearance, thriving famously. It may happen, however, as it has happened to us, that the blossoms now so vigorous and blooming, may all drop off on the second or third day; and the naked plant, after making a sprawling and almost successful attempt to reach the ceiling for a week or so, shall become suddenly sapless and withered, the emblem of a broken-down and emaciated sot—and, what is more, ruined from the self-same cause, an overdose of stimulating fluid. It may happen, on the other hand, that the plant shall have suffered no trick of the gardener’s trade, and shall bloom fairly to the end of its natural term. The commerce in blossoming flowers is one of

the most uncertain and dangerous speculations in which the small street-traders of London can engage. When carried on under favourable circumstances, it is one of the most profitable, the demand for flowers being constant and increasing; but the whole stock-in-trade of a small perambulating capitalist may be ruined by a shower of rain, which will spoil their appearance for the market, and prevent his selling them before they are overblown. Further, as few of these dealers have any means of housing this kind of stock safely during the night, they are often compelled to part with them, after an unfavourable day, at less than prime cost, to prevent a total loss. Still, there are never wanting men of a speculative turn of mind, and the cry of ‘All a-blowin’ an’ a-blowin’ resounds through the streets as long as the season supplies flowers to grow and to blow.

The flower-merchant wheels off, having left a good sprinkling of geraniums in our neighbours’ windows; and his cousin-german, ‘the graveler,’ comes crawling after him, with his cart and stout horse in the middle of the road, while he walks on one side of the pavement, and his assistant on the other. This fellow is rather a singular character, and one that is to be met with probably nowhere upon the face of the earth but in the suburbs of London. He is, *par excellence*, the exponent of a feeling which pervades the popular mind in the metropolis on the subject of the duty which respectable people owe to respectability. It is impossible for a housekeeper in a neighbourhood having any claims to gentility, to escape the recognition of this feeling in the lower class of industrials. If you have a broken window in the front of your house, the travelling glazier thinks, to use his own expression, that you have a right to have it repaired, and therefore that he, having discovered the fracture, has a right to the job of mending it. If your bell-handle is out of order or broken off, the travelling bellman thinks he has a right to repair it, and bores you, in fact, until you commission him to do so—and so on. In the same manner, and on the same principle, so soon as the fine weather sets in, and the front-gardens begin to look gay, the graveler loads his cart with gravel, and shouldering his spade, crawls leisurely through the suburbs with his companion, peering into every garden; and wherever he sees that the walks are grown dingy or moss-grown, he knocks boldly at the door, and demands to be set to work in mending your ways. The best thing you can do is to make the bargain and employ him at once; if not, he will be round again to-morrow, and to-morrow, and to-morrow, and bore you into consenting at last. You live in a respectable house, and you have a right to keep your garden in a respectable condition—and the graveler is determined that you shall do so: has he not brought gravel to the door on purpose? it will cost you but a shilling or two. Thus he lays down the law in his own mind; and sooner or later, as sure as fate, he lays down the gravel in your garden.

While the graveler is patting down the pathway round Robinson’s flower-bed, we hear the well-known cry of a countryman whom we have known any time these ten years, and who, with his wife by his side, has perambulated the suburbs for the best part of his life. He has taken upon himself the patronage of the laundry department, and he shoulds a fagot of clothes-poles, ten feet long, with forked extremities, all freshly cut from the forest. Coils of new rope for drying are hanging upon his arm, and his wife carries a basket well stocked with clothes-pins of a superior description, manufactured by themselves. The cry of ‘Clothes-line-pins’ is one long familiar to the neighbourhood; and as this honest couple have earned a good reputation by a long course of civility and probity, they enjoy the advantage of a pretty extensive connection. Their perambulations are confined to the suburbs,

and it is a question if they ever enter London proper from one year's end to another. It is of no use to carry clothes-poles and drying-lines where there are no conveniences for washing and drying.

Next comes a travelling umbrella-mender, fagoted on the back like the man in the moon of the nursery rhyme-book. He is followed at a short distance by a travelling tinker, swinging his live-coals in a sort of tin censer, and giving utterance to a hoarse and horrible cry, intelligible only to the cook who has a leaky sauce-pan. Then comes the chamois-leather woman, bundled about with damaged skins, in request for the polishing of plate and plated wares. She is one of that persevering class who will hardly take 'No' for an answer. It takes her a full hour to get through the terrace, for she enters every garden, and knocks at every door from No. 1 to No. 30. In the winter-time, she pursues an analogous trade, dealing in what may strictly be termed the raw material, inasmuch as she then buys and cries hare-skins and rabbit-skins. She has, unfortunately, a notoriously bad character, and is accused of being addicted to the practice of taking tuppence and a hare-skin in exchange for a counterfeit shilling.

By this time it is twelve o'clock and past, and Charley Coster, who serves the terrace with vegetables, drives up his stout cob to the door, and is at the very moment we write bargaining with Betty for new potatoes at threepence-half-penny a pound. Betty declares it is a scandalous price for potatoes. 'Yes, dear,' says Charley; 'an' another scanlonous thing is, that I can't sell 'em for no less.' Charley is the most affectionate of costers, and is a general favourite with the abigails of the terrace. His turn-out is the very model of a travelling green-grocer's shop, well stocked with all the fruits and vegetables of the season; and he himself is a model of a coster, clean shaved, clean shod, and trimly dressed, with a flower in his button-hole, an everlasting smile upon his face, and the nattiest of neck-ties. The cunning rogue pretends to be smitten with Betty, and most likely does the same with all the other Bettys of the neighbourhood, to all of whom he chatters incessantly of everything and everybody—save and except of the wife and three children waiting for him at home. He will leave a good portion of his stock behind him when he quits the terrace.

After Charley has disappeared, there is a pause for an hour or two in the flow of professionals past Our Terrace. The few pedestrians that pass along are chiefly gentefolk, who have come abroad this fine morning for an airing—to take a constitutional, and to pick up an appetite for dinner. You may chance to hear the cry of 'Oranges and nuts,' or of 'Cod—live cod,' and you may be entertained by a band of musicians in a gaily-coloured van patrolling for the purpose of advertising the merits of something or other which is to be had for nothing at all, or the next thing to it, if you can prevail upon yourself to go and fetch it. Perhaps Punch and Judy will pitch their little citadel in front of your dwelling; or, more likely still, a band of mock Ethiopians, with fiddle, castanets, and banjo, may tempt your liberality with a performance of *Uncle Ned* or *Old Dan Tucker*; or a corps of German musicians may trumpet you into a fit of martial ardour; or a wandering professor of the German flute soothe you into a state of romance.

As the afternoon wears on, the tranquillity grows more profound. The villas opposite stand asleep in the sunshine; the sound of a single footstep is heard on the pavement; and anon you hear the feeble, cracked voice of old Willie, the water-cress man, distinctly articulating the cry of 'Water-cresses; fine brown water-cresses; royal Albert water-cresses; the best in London—everybody say so.' The water-cresses are welcomed on the terrace as an ornament and something more to the tea-table; and while tea is getting ready for the inhabitants

of the terrace, the dwellers in the opposite villas are seen returning to dinner. The lame match-man now hobbles along upon his crutches, with his little basket of lucifers suspended at his side. He is thoroughly deaf and three parts dumb, uttering nothing beyond an incomprehensible kind of croak by way of a demand for custom. He is a privileged being, whom nobody thinks of interfering with. He has the *entrée* of all the gardens on both sides of the way, and is the acknowledged depositary of scraps and remnants of all kinds which have made their last appearance upon the dinner or supper table.

About five o'clock, the tinkling note of the muffin-bell strikes agreeably upon the ear, suggestive of fragrant souchong and bottom-crusts hot, crackling, and unctuous. Now ensues a delicate savour in the atmosphere of the terrace kitchens, and it is just at its height when Smith, Brown, Jones, and Robinson are seen walking briskly up the terrace. They all go in at Smith's, where the muffin-man went in about half an hour before, and left half his stock behind him. By six o'clock, the lords and ladies of Our Terrace are congregated round their tea-urns; and by seven, you may see from one of the back-windows a tolerable number of the lords, arrayed in dressing-gowns and slippers, and some of them with corpulent meerschauts dangling from their mouths, strolling leisurely in the gardens in the rear of their dwellings, and amusing themselves with their children, whose prattling voices and innocent laughter mingle with the twittering of those suburban songsters, the sparrows, and with the rustling of the foliage, stirred by the evening breeze. These pleasant sounds die away by degrees. Little boys and girls go to bed; the gloom of twilight settles down upon the gardens; candles are lighted in the drawing-rooms, and from a dozen houses at once pianofortes commence their harmony. At No. 12, the drawing-room windows are open, though the blinds are down; and the slow-pacing policeman pauses in his round, and leans against the iron railings, being suddenly brought up by the richly-harmonious strains of a glee for three voices: Brown, Jones, and Robinson are doing the *Chough and Crow*; and Smith, who prides himself on his semi-grand, which he tunes with his own hands once a week, is doing the accompaniment in his best style. The merry chorus swells delightfully upon the ear, and is heard half way down the terrace: the few foot-passengers who are passing stop under the window to listen, till one of them is imprudent enough to cry 'Encore,' when down go the windows, and the harmonious sounds are shut in from vulgar ears.

It is by this time nearly half-past nine o'clock, and now comes the regular nightly 'tramp, tramp' of the police, marching in Indian file, and heavily clad in their night-gear. They come to replace the guardians of the day by those of the night. One of the number falls out of the line on the terrace, where he commences his nocturnal wanderings, and guarantees the peace and safety of the inhabitants for the succeeding eight hours: the rest tramp onwards to their distant stations. The echoes of their iron heels have hardly died away, when there is a sudden and almost simultaneous eruption from every garden-gate on the terrace of clean-faced, neat-aproned, red-elbowed servant-girls, each and all armed with a jug or a brace of jugs, with a sprinkling of black bottles among them, and all bound to one or other of the public-houses which guard the terrace at either end. It is the hour of supper; and the supper-beer, and the after-supper nightcaps, for those who indulge in them, have to be procured from the publican. This is an occasion upon which Betty scorns to hurry; but she takes time by the forelock, starting for the beer as soon as the cloth is laid, and before master has finished his pipe, or his game of chess, or Miss Clementina her song, in order that she may have leisure for a little gossip with No. 7 on the one hand, or No. 9 on the

other. She goes out without beat of drum, and lets herself in with the street-door key without noise, bringing home, besides the desiderated beverage, the news of the day, and the projects of next-door for the morrow, with, it may be, a plan for the enjoyment of her next monthly holiday.

Supper is the last great business of the day upon Our Terrace, which, by eleven at night, is lapped in profound repose. The moon rides high in mid-sky, and the black shadows of the trees lie motionless on the white pavement. Not a footfall is heard abroad; the only sound that is audible as you put your head out of the window, to look up at the glimmering stars and radiant moon, is the distant and monotonous murmur of the great metropolis, varied now and then by the shrill scream of a far-off railway-whistle, or the 'cough, cough, cough' of the engine of some late train. We are sober folks on the terrace, and are generally all snug abed before twelve o'clock. The last sound that reaches our ears ere we doze off into forgetfulness, is the slow, lumbering, earthy advance of a huge outward-bound wagon. We hear it at the distance of half a mile, and note distinctly the crushing and pulverising of every small stone which the broad wheels roll over as they sluggishly proceed on their way. It rocks us in our beds as it passes the house; and for twenty minutes afterwards, if we are awake so long, we are aware that it is groaning heavily onwards, and shaking the solid earth in its progress—till it sinks away in silence, or we into the land of dreams.

SLAVES IN BRITAIN.

It has sometimes been predicted, not without plausibility, that if this great empire should sink before the rising genius of some new state, when all it has accomplished in arts and arms, and its wealth, its literature, its machinery, are forgotten, its struggles for humanity in the abolition of negro slavery will stand forth in undiminished lustre. All the steps of this mighty operation are interesting. It is a peculiarity of England and its institutions, that many of the most momentous constitutional conflicts have taken place in the courts of law. In despotic countries, this seldom occurs, because the rulers can bend the courts of law to their pleasure; but here, even under the worst governments, whatever degree of freedom was really warranted by law, could be secured by the courts of justice. When it was said that the air of Britain was too pure for a slave to breathe in—that his shackles fell off whenever he reached her happy shore—the sentiment was noble; but the question depended entirely on the law and its technical details. The trials resulting in a decision against slavery, have thus much interest from the influence they exercised on human progress.

There seemed to be every probability that the interesting question, whether ownership in slaves continued after they had reached Britain, would have been tried in Scotland. In the middle of last century, a Mr Sheddan had brought home from Virginia a negro slave to be taught a trade. He was baptised, and, learning his trade, began to acquire notions of freedom and citizenship. When the master thought he had been long enough in Scotland to suit his purpose, the negro was put on board a vessel for Virginia. He got a friend, however, to present for him a petition to the Court of Session. The professional report of the case in *Marison's Dictionary of Decisions* says: 'The Lords appointed counsel for the negro, and ordered memorials, and afterwards a hearing in presence, upon the respective claims of liberty and servitude by the master and the negro; but during the hearing in presence, the negro died, so the point was not determined.' In the English case, to which we shall presently advert, it was maintained, that from the known temper and opinions of the court, the decision would undoubtedly have

been in the negro's favour. At the time when Mr Grenville Sharp, to his immortal honour, took up in the courts of law the question of personal liberty as a legal right, there was a more serious risk of Britain becoming a slave state than it is now easy to imagine. There was no chance of negroes being employed in gangs in the field or in manufactories, but there was imminent danger of their being brought over and kept in multitudes as domestic servants, just as they are still in some of the southern states of America. Mr Sharp drew attention to the following advertisement in the *Public Advertiser* of 28th March 1763, as one of a kind becoming too common:

'To be sold, a Black Girl, the property of J. B—, eleven years of age, who is extremely handy, works at her needle tolerably, and speaks English perfectly well; is of an excellent temper and willing disposition.'

'Inquire of Mr Owen, at the Angel Inn, behind St Clement's Church in the Strand.'

Mr Sharp's early conflicts in the law-courts are more romantic than the last and decisive one. He and his brother had found a poor mendicant negro, called Jonathan Strong, in rags on the streets of London. They took him into their service, and after he had become plump, strong, and acquainted with his business, the man who had brought him from the colonies, an attorney, seeing him behind a carriage, set covetous eyes on him. The lad was waylaid on a false message to a public-house, seized, and committed to the Compter, where, however, he managed to make Mr Sharp acquainted with his position. The indefatigable philanthropist had him brought before the lord mayor as sitting magistrate. After hearing the case stated, his lordship said: 'The lad had not stolen anything, and was not guilty of any offence, and was therefore at liberty to go away.' A captain of a vessel, saying he had been employed by a person who had just bought the youth, to convey him to Jamaica, seized him by the arm as his employer's property. A lawyer standing behind Mr Sharp, who seems to have been puzzled how to proceed, whispered, 'Charge him.' Sharp charged the captain with an assault, and as he would have been immediately committed by the lord mayor if he persisted, he let go his hold. The philanthropist was threatened with a prosecution for abstraction of property, but it was abandoned.

This occurred in 1767. The next important case was that of a negro named Lewis. He 'had formerly,' says Mr Sharp's biographer, 'been a slave in possession of a Mr Stapylton, who now resided at Chelsea. Stapylton, with the aid of two watermen, whom he had hired for that purpose, in a dark night seized the person of Lewis, and, after a struggle, dragged him on his back into the water, and thence into a boat lying in the Thames, where, having first tied his legs, they endeavoured to gag him by running a stick into his mouth; and then rowing down to a ship bound for Jamaica, whose commander was previously engaged in the wicked conspiracy, they put him on board, to be sold as a slave on his arrival in the island.' The negro's cries, however, were heard; the struggle was witnessed; and information given in the quarter whence aid was most likely to come. Mr Sharp lost no time in obtaining a writ of habeas corpus. The ship in the meantime had sailed from Gravesend, but the officer with the writ was able to board her in the Downs. There he saw the negro chained to the mast. The captain was at first furious, and determined to resist; but he knew the danger of defying an officer with such a writ as a habeas corpus, and found it necessary to yield. The writ came up before Lord Mansfield. He did not go into the general question of slavery, for there was an incidental point on which the case could be decided on the side of humanity—the captain and the persons employing him could not prove their property in the slave, supposing such property lawful. He was not

only liberated, but his captors were convicted of assault.

These cases, however, did not decide the wide question, whether it was lawful to hold property in negroes in this country. It came at last to be solemnly decided in 1771, on a habeas corpus in the King's Bench. Affidavits having been made before Lord Mansfield, that a coloured man, named Somerset, was confined in irons on board a vessel called the *Ann and Mary*, bound for Jamaica, he granted a habeas corpus against the captain, to compel him to give an account of his authority for keeping the man in custody. Somerset had been a slave in Virginia, the property of a Mr Stewart; and the captain of the vessel stated that the owner had put him on board, to be conveyed to Jamaica, and there sold. In what was called the return to the writ, the justification for keeping Somerset in restraint was thus quaintly stated:—'That at the time of bringing the said James Somerset from Africa, and long before, there were, and from thence hitherto there have been, and still are, great numbers of negro slaves in Africa; and that during all the time aforesaid, there hath been, and still is a trade, carried on by his majesty's subjects from Africa, to his majesty's colonies or plantations of Virginia and Jamaica, in America, and other colonies and plantations belonging to his majesty in America, for the necessary supplying of the foresaid colonies and plantations with negro slaves.' It proceeded to relate with the same verbosity, that the slaves so brought from Africa 'have been and are saleable and sold as goods and chattels; and upon the sale thereof, have become, and been, and are, the slaves and property of the purchasers thereof.' It was stated that Mr Stewart, who resided in Virginia, had Somerset as a domestic slave or valet—that having business to transact in London, he took his usual attendant there, intending to take him back to Virginia. Somerset, however, made his escape; and when he was apprehended, his master, probably believing that he would thenceforth be rather a troublesome valet, changed his intention, and put the negro into the hands of the captain of a vessel bound for Jamaica, that he might be sold there.

The pleadings upon the legality of this proceeding were solemn and full. The question was, Whether it was to be held a just inference, from the fact of the slave, being undoubtedly by the law of the day property in the colonies, that, while his colonial master made a temporary stay in Britain, he should be property there also, without any direct law to that effect. Had it been a question of inanimate goods, there would be no reason why the property should not continue in the colonial owner. It would be all one to the inanimate object what hands it was in, and regularity and justice would decree that the person who was owner of it in one country should be so in another. But in these cases there was a separate adverse interest of a very strong character. Was the uniformity of this right of possession sufficient to overrule another right—that which every man, black or white, had to the freedom of his own person, unless there was special law to restrain it? The counsel for the negro not only pleaded strongly on this his personal right, but on the consequence to the moral condition of the British Empire, if the inhabitants of slave countries could bring their slaves hither. From the strictness of the laws, and the uniformity of the course of justice, if slaves were permitted in England, it was the very place where property in them would be most secure. Thus the country might become a resort of slaveholders, and its boasted purity and freedom would be sadly contaminated. 'If that right,' said Mr Hargrave, 'is here recognised, domestic slavery, with its horrid train of evils, may be lawfully imported into this country, at the discretion of every individual, foreign and native. It will come not only from our own colonies, and those of other European nations, but from Poland, Russia, Spain, and Turkey—from the coast of Barbary, from

the western and eastern coasts of Africa—from every part of the world where it still continues to torment and dishonour the human species.'

The counsel on the other side was the celebrated Mr Dunning, afterwards Lord Ashburton, a friend of freedom, who seems to have undertaken the cause on notions of professional duty, and without any great inclination for it. His first words were: 'It is incumbent on me to justify Captain Knowles's detainer of the negro.' He was careful to shew, that he did not in the meantime maintain that there was an absolute property in Somerset—it was sufficient to shew, that there was a sufficient presumption of property to authorise the shipmaster in detaining him until the absolute question of right was solemnly settled. He proceeded to say: 'It is my misfortune to address an audience, the greater part of which I fear are prejudiced the other way. But wishes, I am well convinced, will never be allowed by your lordships to enter into the determination of the point. This cause must be what in fact and law it is. Its fate, I trust, therefore, depends on fixed and variable rules, resulting by law from the nature of the case. For myself, I would not be understood to intimate a wish in favour of slavery by any means; nor, on the other side, to be supposed the maintainer of an opinion contrary to my own judgment. I am bound in duty to maintain those arguments which are most useful to Captain Knowles, as far as is consistent with truth; and if his conduct has been agreeable to the laws throughout, I am under a further indispensable duty to support it.'

Much reference was made to the ancient laws of villenage, or semi-slavery, in Britain. Mr Dunning maintained, that these were testimony that a slave was not an utter anomaly in the country. The class of villeins had disappeared, and the law regarding them was abolished in the reign of Charles II. But he maintained, that there was nothing in that circumstance to prohibit others from establishing a claim upon separate grounds. He said: 'If the statute of Charles II. ever be repealed, the law of villenage revives in its full force.' It was stated that there were in Britain 15,000 negroes in the same position with Somerset. They had come over as domestics during the temporary sojourn of their owner-masters, intending to go back again. Then it was observed, that many of the slaves were in ships or in colonies which had not special laws for the support of slavery; and by the disfranchisement of these, British subjects would lose many millions' worth of property, which they believed themselves justly to possess.

British justice, however, has held at all times the question of human liberty to be superior to considerations of mere expediency. If the question be, who gains or loses most, there never can be a doubt that the man whose freedom has been reft from him has the greatest of all claims for indulgence. Accordingly, Lord Mansfield, the presiding judge, looking in the face all the threatened evils to property, held that nothing but absolute law could trench on personal freedom. He used on the occasion a Latin expression, to the effect that justice must be done at whatever cost; it has found its way into use as a classical expression, and as no one has been able to find it in any Latin author, it is supposed to have been of Lord Mansfield's own coining. 'Mr Stewart,' he said, 'advances no claims on contract; he rests his whole demand on a right to the negro as slave, and mentions the purpose of detainure of him to be the sending him over to be sold in Jamaica. If the parties will have judgment, *fiat justitia ruat cælum*—Let justice be done whatever be the consequence.' In finally delivering judgment, he concluded in these simple but expressive terms: 'The state of slavery is of such a nature, that it is incapable of being introduced, on any reasons, moral or political, but only by positive law, which preserves its force long after the reasons, occasion, and time itself, for which

it was created, are erased from memory. It is so odious, that nothing can be suffered to support it but positive law. Whatever inconveniences, therefore, may follow from the decision, I cannot say this case is allowed or approved by the law of England; and therefore the black must be discharged.'

A few years afterwards—in 1778—a case occurred in Scotland, where the question of a master's rights over a negro slave in Britain was at issue. The right claimed in this case, however, was not of so offensive a nature. The master did not claim the power of seizing the negro as his property. He maintained, however, that their mutual position gave him a right to claim the negro's services, as if he had engaged himself as a servant for life. Mr Wedderburn had bought in Jamaica a negro named Knight, about twelve years old. He came to Scotland as Mr Wedderburn's personal servant, married in the country, and for some years seemed contented with his position. Probably at the suggestion of some one who wished to try the question, as it had been tried in England, Knight went off, avowing his intention of being free. Mr Wedderburn applied to a justice of peace, who at once issued a warrant for the negro's apprehension. The matter, however, came before the sheriff, a professional judge, who decided that the colonial laws of slavery do not extend to Scotland, and that personal service for life is just another term for slavery. After a tedious litigation, this view was affirmed by the Court of Session, and the negro was declared free. The case acquired notice from the interest taken in it by Dr Johnson, and the frequent mention of it in Boswell's well-known work.

THE OLD HOUSEKEEPER'S TALE.

AFTER my good and excellent mistress, Mrs Dacre, departed this life for a better, it seemed as if nothing ever prospered in the family, whom I had the honour of serving in the capacity of confidential housekeeper. Mr Dacre became morose and careless of his affairs; his sons were a source of great misery to him, pursuing a course of reckless extravagance and heartless dissipation; while the five young ladies—the youngest of whom, however, had attained the age of twenty-four—cared for little else than dress, and visiting, and empty show. These five young ladies had not amiable dispositions or gentle manners; but they were first-rate horsewomen, laughed and talked very loud, and were pronounced fine dashing women. There was another member of the family, an orphan niece of my master's, who had greatly profited by my lamented lady's teaching and companionship. Miss Marion had devoted herself to the sick-room with even more than a daughter's love; and for two years she had watched beside the patient sufferer, when her more volatile and thoughtless cousins refused to credit the approach of death. Miss Marion had just entered her twentieth year; life had not been all summer with her; for she remembered scenes of privation and distress, ere the decease of her parents left her, their only child, to the care of affluent relatives. She was a serious and meek, but affectionate creature; of a most goodly countenance and graceful carriage; and I used sometimes to think that the Misses Dacre were jealous of the admiration she excited, and kept her in the background as much as possible. It was not difficult to do this, for Miss Marion sought and loved retirement. After Mrs Dacre's decease, she had expressed an urgent wish to earn her bread by filling the situation of a governess. But the pride of the Dacres revolted at this; besides, Miss Marion was a comfort to her uncle, when his daughters were absent or occupied. So the dear young lady gave up her own wishes, and strove to do all she could for her generous benefactor, as she was wont to call my master.

Circumstances, which it were needless to detail,

except to say that, although I had served *one* mistress satisfactorily, I found it impossible to serve *five*, determined me to resign the situation I had creditably filled for so many years. I deeply grieved to leave my beloved Miss Marion; and she, sweet, humble soul, on her part, yearned towards me, and wept a farewell on my bosom. I betook myself, in the first instance, to my brother Thomas Wesley and his wife—a worthy couple without children, renting a small farm nearly a hundred miles off. A very pleasant, small farm it was, situated in a picturesque valley, through which tumbled and foamed a limpid hill-stream, washing the roots of fine old trees, and playing all sorts of antics. This valley was a resort of quiet anglers, and also of artists during the summer season; and Thomas and Martha Wesley often let a neat parlour and adjoining bedroom to such respectable, steady people as did not object to observe the primitive hours and customs enforced at Fairdown Farm. Here I enjoyed the privilege of writing to, and hearing from, my dear Miss Marion; and though she never complained, or suffered a murmur to escape her, yet from the tenor of her letters I had great cause to fear things were all going very wrong at Mr Dacre's, and that her own health, always delicate, was giving way beneath the pressure of anxiety and unkindness.

In less than six months after I had quitted the family, a climax, which I had long anticipated with dread, actually arrived. Mr Dacre, suddenly called to his account, was found to have left his temporal affairs involved in inextricable and hopeless ruin; and amid the general crash and desolation, who was to shield or befriend the poor dependent, the orphan niece, Miss Marion? She was rudely cast adrift on the cold world; her proffered sympathy and services tauntingly rejected by those who had now a hard battle to fight on their own account. Broken down in health and spirits, the poor young lady flew to me, her humble, early friend, gratefully and eagerly availing herself of Thomas Wesley's cordial invitation, to make his house her home for the present.

My brother was a kind-hearted, just man; he had once been to see me when I lived at Mr Dacre's; and that gentleman, in his palmy days, was truly hospitable and generous to all comers. Thomas never forgot his reception, and now he was a proud and happy man to be enabled thus to offer 'a slight return,' as he modestly said, to one of the family. With much concern we all viewed Miss Marion's wan and careworn looks, so touching in the young; 'But her dim blue eyes will get bright again, and she'll fill out—never fear,' said Martha Wesley to me, by way of comfort and encouragement, 'now we've got her amongst us, poor dear. I doubt those proud Misses Dacre were not over-tender with such a one as sweet Miss Marion.'

'Dame, dame, don't let that tongue of thine wag so fast,' interrupted Thomas, for he never liked to hear people ill spoken of behind their backs, though he would speak out plainly enough to everybody's face.

A few days after Miss Marion's arrival at Fairdown (it was just at the hay-making season, and the earth was very beautiful—birds singing and flowers blooming—soft breezes blowing, and musical streamlets murmuring rejoicingly in the sunshine), a pedestrian was seen advancing leisurely up the valley, coming in a direction from the neighbouring town—a distance, however, of some miles, and the nearest point where the coach stopped. The stranger, aided in his walk by a stout stick, was a short, thickset, elderly man, clad in brown habiliments from head to foot: a brown, broad-brimmed hat, an antiquated brown spencer (a brown wig must not be omitted), brown gaiters, and brown cloth boots, completed his attire. His linen was spotless and fine, his countenance rubicund and benevolent; and when he took off his green spectacles, a pair of the clearest and honestest brown eyes ever set in mortal's head

looked you full in the face. He was a nice, comfortable-looking old gentleman; and so Thomas and I both thought at the same moment—for Martha was out of the way, and I shewed the apartments for her; the stranger, who gave his name as Mr Budge, having been directed to our house by the people of the inn where the coach stopped, who were kin to Martha, and well-disposed, obliging persons.

Mr Budge said he wanted quietness for some weeks, and the recreation of fishing; he had come from the turmoil of the great city to relax and enjoy himself, and if Thomas Wesley would kindly consent to receive him as a lodger, he would feel very much obliged. Never did we listen to so pleasant and obliging a mode of speaking; and when Mr Budge praised the apartments, and admired the country, the conquest of Thomas's heart was complete. 'Besides,' as Martha sagaciously remarked, 'it was so much better to have a steady old gentleman like this for a lodger, when pretty Miss Marion honoured them as a guest.' I thought so too; my dear young lady being so lone and unprotected by relatives, we all took double care of her.

So Mr Budge engaged the rooms, and speedily arrived to take possession, bringing with him a spick-and-span new fishing-rod and basket. He did not know much about fishing, but he enjoyed himself just as thoroughly as if he did; and he laughed so good-humouredly at his own Cockney blunders, as he called them, that Thomas would have been quite angry had any one else presumed to indulge a smile at Mr Budge's expense. A pattern lodger in all respects was Mr Budge—deferential towards Martha and myself, and from the first moment he beheld Miss Marion, regarding her as a superior being, yet one to be loved by a mortal for all that. Mr Budge was not a particularly communicative individual himself, though we opined from various observations, that, although not rich, he was comfortably off; but somehow or other, without appearing in the least inquisitive, he managed to obtain the minutest information he required. In this way, he learned all the particulars respecting Miss Marion; and gathered also from me, my own desire of obtaining a situation, such as I had held at Mr Dacre's, but in a small and well-regulated household. As to Miss Marion, the kind old gentleman could never shew kindness enough to her; and he watched the returning roses on her fair cheeks with a solicitude scarcely exceeded by mine. I never wondered at anybody admiring and loving the sweet, patient girl; but Mr Budge's admiration and apparent affection so far exceeded the bounds of mere conventional kindness in a stranger, that sometimes I even smilingly conjectured he had the idea of asking her to become Mrs Budge, for he was a widower, as he told us, and childless.

Such an idea, however, had never entered Miss Marion's innocent heart; and she, always so grateful for any little attention, was not likely to receive with coldness those so cordially lavished on her by her new friend, whom she valued as a truly good man, and not for a polished exterior, in which Mr Budge was deficient. Nay, so cordial was their intimacy, and so much had Miss Marion regained health and cheerfulness, that with unwonted sportiveness, on more than one occasion she actually hid the ponderous brown snuff-box, usually reposing in Mr Budge's capacious pocket, and only produced it when his distress became real; whereupon he chuckled and laughed, as if she had performed a mighty clever feat, indulging at the same time, however, in a double pinch.

Some pleasant weeks to us all had thus glided away, and Miss Marion was earnestly consulting me about her project of governingess, her health being now so restored; and I, for my part, wanted to execute my plans for obtaining a decent livelihood, as I could not

think of burdening Thomas and Martha any longer, loath as they were for me to leave them. Some pleasant weeks, I say, had thus glided away, when Mr Budge, with much ceremony and circumlocution, as if he had deeply pondered the matter, and considered it very weighty and important, made a communication which materially changed and brightened my prospects. It was to the effect, that an intimate friend of his, whom he had known, he said, all his life, required the immediate services of a trustworthy housekeeper, to take the entire responsible charge of his house. 'My friend,' continued Mr Budge, tapping his snuff-box complacently, his brown eyes twinkling with the pleasure of doing a kind act, for his green specs were in their well-worn case at his elbow—'My friend is about my age—a sober chap, you see, Mrs Deborah;' here a chuckle—and he has no wife and no child to take care of him'—here a slight sigh: 'he has lately bought a beautiful estate, called Sorel Park, and it is there you will live, with nobody to interfere with you, as the lady-relative who will reside with my friend is a most amiable and admirable young lady; and I am sure, Mrs Deborah, you will become much attached to her. By the by, Mrs Deborah,' he continued, after pondering for a moment, 'will you do me a favour to use your influence to prevent Miss Marion from accepting any appointment for the present, as after you are established at Sorel Park, I think I know of a home that may suit her?'

I do not know which I felt most grateful or delighted for—my own prospects, or my dear Miss Marion's; though certainly hers were more vague and undefined than mine, for the remuneration offered for my services was far beyond my expectation, and from Mr Budge's description of Sorel Park, it seemed to be altogether a place beyond my most sanguine hopes. I said something about Miss Marion, and my hope that she might be as fortunate as myself; and Mr Budge, I was happy to see, was quite fervent in his response. 'My friend,' said he, at the close of the interview, 'will not arrive to take possession of Sorel Park until you, Mrs Deborah, have got all things in order; and as I know that he is anxious for the time to arrive, the sooner you can set out on your journey thither the better. I also must depart shortly, but I hope to return hither again.' Important business required Mr Budge's personal attention, and with hurried adieu to us all, he departed from Fairdown; and in compliance with his request, I set off for Sorel Park, leaving my beloved Miss Marion to the care of Thomas and Martha for the present.

The owner of this fine place was not as yet known there; for Mr Budge, being a managing man, had taken everything upon himself, and issued orders with as lordly an air as if there was nobody in the kingdom above the little brown man. The head-gardener, and some of the other domestics, informed me they had been engaged by Mr Budge himself, who, I apprehended, made very free and busy with the concerns of his friend. Sorel Park was a princely domain, and there was an air of substantial comfort about the dwelling and its appointments, which spoke volumes of promise as to domestic arrangements in general. I soon found time to write a description of the place to Miss Marion, for I knew how interested she was in all that concerned her faithful Deborah; and I anxiously awaited the tidings she had promised to convey—of Mr Budge having provided as comfortably for her as he had for me. I at length received formal notification of the day and hour the owner of Sorel Park expected to arrive, accompanied by his female relative. This was rather earlier than I had been led to expect; but all things being in order for their reception, I felt glad at their near approach, for I was strangely troubled and nervous to get this introduction over. I was very anxious, too, about my

dear Miss Marion; for I knew that some weighty reason alone prevented her from answering my letter, though what that reason could be, it was impossible for me to conjecture.

The momentous day dawned; the hours glided on; and the twilight hour deepened. The superior servants and myself stood ready to receive the travellers, listening to every sound; and startled, nevertheless, when the rapid approach of carriage-wheels betokened their close proximity. With something very like disappointment, for which I accused myself of ingratitude, I beheld Mr Budge, browner than ever, alight from the chariot, carefully assisting a lady, who seemed in delicate health, as she was muffled up like a mummy. Mr Budge returned my respectful salutation most cordially, and said, with a smile, as he bustled forwards to the saloon, where a cheerful fire blazed brightly on the hearth—for it was a chill evening: 'I've brought your new mistress home, you see, Mrs Deborah; but you want to know where your new master is—eigh? Well, come along, and this young lady will tell you all about the old fellow.'

I followed them into the apartment; Mr Budge shut the door; the lady flung aside her veil, and my own dear, sweet Miss Marion clasped me round the neck, and sobbed hysterically in my arms.

'Tell her, my darling,' said Mr Budge, himself quite husky, and turning away to wipe off a tear from his ruddy cheek—'tell her, my darling, you're the *mistress* of Sorel Park; and when you've made the good soul understand that, tell her we'd like a cup of tea before we talk about the *master*.'

'O my dear Miss Marion!' was all I could utter; 'what does this mean? Am I in a dream?' But it was not a happy dream; for when I had a moment to reflect, my very soul was troubled as I thought of the sacrifice of all her youthful aspirations, made by that poor, gentle creature, for the sake of a secure and comfortable home in this stormy world. I could not reconcile myself to the idea of Mr Budge and Marion as man and wife; and as I learned, ere we retired to rest that night, I had no occasion to do so. Mr Budge was Miss Marion's paternal uncle, her mother, Miss Dacre, having married his elder brother. These brothers were of respectable birth, but inferior to the Dacres; and while the elder never prospered in any undertaking, and finally died of a broken heart, the younger, toiling in foreign climes, gradually amassed a competency. On returning to his native land, he found his brother no more, and the orphan girl he had left behind placed with her mother's relatives.

Mr Budge had a great dread of appearing before these proud patrician people, who had always openly scorned his deceased brother; and once accidentally encountering them at a public *fête*, the contumelious bearing of the young ladies towards the little brown gentleman deterred him from any nearer approach. No doubt, he argued, his brother's daughter was deeply imbued with similar principles, and would blush to own a 'Mr Budge' for her uncle! This name he had adopted as the condition of inheriting a noble fortune unexpectedly bequeathed by a plebeian, but worthy and industrious relative, only a few years previous to the period when Providence guided his footsteps to Fairdown Farm and Miss Marion.

The moderate competency Mr Budge had hitherto enjoyed, and which he had toiled hard for, now augmented to ten times the amount, sorely perplexed and troubled him; and after purchasing Sorel Park, he had flown from the turmoil of affluence, to seek peace and obscurity for awhile, under pretext of pursuing the philosophical recreation of angling. How unlike the Misses Dacre was the fair and gracious creature he encountered at Fairdown! And not a little the dear old gentleman prided himself on his talents for what he called diplomacy—arranging his plans, he said, 'just like a

book-romance.' After my departure, he returned to Fairdown, and confided the wonderful tidings to Thomas and Martha Wesley, more cautiously imparting them to Miss Marion, whose gentle spirits were more easily fluttered by sudden surprise.

For several years, Mr Budge paid an annual visit to Fairdown, when the trout-fishing season commenced; and many useful and valuable gifts found their way into Thomas's comfortable homestead, presented by dear Miss Marion. In the course of time, she became the wife of one worthy of her in every respect—their lovely children often sportively carrying off the ponderous box of brown rappee, and yet Uncle Budge never frowning.

These darlings cluster round my knees, and one, more demure than the rest, thoughtfully asks: 'Why is Uncle Budge's hair not snowy white, like yours, dear Deb? For Uncle Budge says he is very old, and that God will soon call him away from us.'

ADVENTURES IN JAPAN.

FOR above two hundred years, the unknown millions of Japan have been shut up in their own islands, forbidden, under the severest penalties, either to admit foreigners on their shores, or themselves to visit any other realm in the world. The Dutch are permitted to send two ships in a year to the port of Nangasacki, where they are received with the greatest precaution, and subjected to a surveillance even more degrading than was that formerly endured by the Europeans at Canton. Any other foreigner whom misfortune or inadvertence may land on their shores, is doomed to perpetual imprisonment; and even if one of their own people should pass twelve months out of the country, he is, on his return, kept for life at the capital, and suffered no more to join his family, or mingle at large in the business or social intercourse of life. In pursuance of this policy, it is believed that the Japanese government now holds in captivity several subjects of the United States, and it is expected that an armament will be sent to rescue them by force.

Since this announcement has been made, and the general expectation has been raised that Japan will soon have to submit, like China, to surrender its isolation, and enter into relations with the rest of the civilised world, there has seasonably appeared an English reprint of a work hitherto little known among us—a personal narrative of a Japanese captivity of two years and a half, by an officer in the Russian navy.* If we may judge from its details, our transatlantic friends had need to keep all their eyes wide open in dealing with this people.

The leading circumstances connected with Captain Golownin's captivity were the following:—In the year 1808, the Chamberlain Resanoff was sent by the Emperor Alexander, to endeavour to open friendly relations with Japan, and sailed from the eastern coasts in a merchant vessel belonging to the American Company. But receiving a peremptory message of dismissal, and refusal of all intercourse, he returned to Okhotsk, and died on his way to St Petersburg. Lieutenant Chwostoff, however, who had commanded the vessel, put to sea again on his own responsibility, attacked and destroyed several Japanese villages on the Kurile Islands, and carried off some of the inhabitants. In the year 1811, Captain Golownin, commander of the imperial war-ship *Diana*, lying at Kamtschatka, received orders from headquarters to make a particular survey of the southern Kurile Islands, and the coast of Tartary. In pursuance of his instructions, he was sailing without any flag near the coast of Eetooroop (Staaten), when he was met by some Russian Kuriles, who informed him that they had been

* *Japan and the Japanese.* By Captain Golownin. London: Colburn & Co. 1852.

seized, and were still detained prisoners, on account of the Chrostoff outrage. They persuaded the captain to take one of them on board as an interpreter, and proceeded to Kunashir, to make such explanations as might exonerate the Russian government in this matter. The Japanese chief of the island further assured the Russians, that they could obtain a supply of wood, water, and fresh provisions at Kunashir; and he furnished them with a letter to its governor. The reception of the *Diana* at Kunashir was, in the first instance, a vigorous but ineffective discharge of guns from the fortress, the walls of which were so completely hung with striped cloth, that it was impossible to form any opinion of the size or strength of the place. After some interchange, however, of allegorical messages, conveyed by means of drawings floated in empty casks, Golownin was invited on shore by the beckoning of white fans. Concealing three brace of pistols in his bosom, and leaving a well-armed boat close to the shore, with orders that the men should watch his movements, and act on his slightest signal, he ventured on a landing, accompanied by the Kurile Alexei and a common sailor. The lieutenant-governor soon appeared. He was in complete armour, and attended by two soldiers, one of whom carried his long spear, and the other his cap or helmet, which was adorned with a figure of the moon. 'It is scarcely possible,' says the narrator, 'to conceive anything more ludicrous than the manner in which the governor walked. His eyes were cast down and fixed on the earth, and his hands pressed closely against his sides, whilst he proceeded at so slow a pace, that he scarcely moved one foot beyond the other, and kept his feet wide apart. I saluted him after the European fashion, upon which he raised his left hand to his forehead, and bowed his whole body towards the ground.'

In the conversation that ensued, the governor expressed his regret that the ignorance of the Japanese respecting the object of this visit should have occasioned them to fire upon the *Diana*. He then closely interrogated the captain as to the course and objects of his voyage, his name, the name of his emperor, and whether he knew anything of Resanoff. On the first of these heads, Golownin deemed it prudent to use some deception, and he stated that he was proceeding to St Petersburg, from the eastern extremity of the Russian Empire; that contrary winds had considerably lengthened his voyage; and that, being greatly in want of wood and fresh water, he had been looking on the coasts for a safe harbour where these might be procured, and had been directed by an officer at Eetooroop to Kunashir. To all the other questions, he returned suitable answers, which were carefully written down. The conference ended most amicably, and the captain was invited to smoke tobacco, and partake of some tea, *sagi*,* and caviar. Everything was served on a separate dish, and presented by a different individual, armed with a poniard and sabre; and these attendants, instead of going away after handing anything to the guests, remained standing near, till at length they were surrounded by a formidable circle of armed men. Golownin would not stoop to betray alarm or distrust, but having brought some French brandy as a present to the governor, he desired his sailors to draw a bottle, and took this opportunity of repeating his order, that they should hold themselves in readiness. There appeared, however, no intention of resorting to violence. When he prepared to depart, the governor presented a flask of *sagi*, and some fresh fish, pointing out to him at the same time a net which had been cast to procure a larger supply. He also gave him a white fan, with which he was to beckon, as a sign of amity, when he came on shore again. The whole draught of fish was sent on board in the evening.

On the following day, the captain, according to

appointment, paid another visit on shore, accompanied by two officers, Alexei, and four seamen carrying the presents intended for the Japanese. On this occasion, the former precautions were dispensed with; the boat was hauled up to the shore, and left with one seaman, while the rest of the party proceeded to the castle. The result was, that after a renewal of the friendly explanations and entertainments of the preceding day, the treacherous Japanese threw off the mask, and made prisoners of the whole party.

The first thing done, was to tie our hands behind our backs, and conduct us into an extensive but low building, which resembled a barrack, and which was situated opposite to the tent in the direction of the shore. Here we were placed on our knees, and bound in the cruellest manner with cords about the thickness of a finger; and as though this were not enough, another binding of smaller cords followed, which was still more painful. The Japanese are exceedingly expert at this work; and it would appear that they conform to some precise regulation in binding their prisoners, for we were all tied exactly in the same manner. There was the same number of knots and nooses, and all at equal distances, on the cords with which each of us was bound. There were loops round our breasts and necks; our elbows almost touched each other, and our hands were firmly bound together. From these fastenings proceeded a long cord, the end of which was held by a Japanese, and which, on the slightest attempt to escape, required only to be drawn to make the elbows come in contact with the greatest pain, and to tighten the noose about the neck to such a degree as almost to produce strangulation. Besides all this, they tied our legs in two places—above the knees and above the ankles; they then passed ropes from our necks over the cross-beams of the building, and drew them so tight, that we found it impossible to move. Their next operation was searching our pockets, out of which they took everything, and then proceeded very quietly to smoke tobacco. While they were binding us, the lieutenant-governor shewed himself twice, and pointed to his mouth, to intimate, perhaps, that it was intended to feed, not to kill us.'

After some hours, the legs and ankles of the prisoners were partially loosed, and preparations were made for removing them to Matsmai, which seems to be the head-quarters of government for the Kurile dependencies of Japan. The journey, which occupied above a month, was performed partly in boats, which were dragged along the shore, and even for miles over the land; and partly on foot, the captives being marched in file, each led with a cord by a particular conductor, and having an armed soldier abreast of him. It was evident, however, that whatever was rigorous in their treatment, was not prompted by personal feelings of barbarity, but by the stringency of the law, which would have made the guards answerable for their prisoners with their own lives. They were always addressed with the greatest respect; and, as soon as it was deemed safe, their hands, which were in a dreadfully lacerated state, were unbound, and surgically treated; but not till their persons had been again most carefully searched, that no piece of metal might remain about them, lest they might contrive to destroy themselves. Suicide is, in Japan, the fashionable mode of terminating a life which cannot be prolonged but in circumstances of dishonour: to rip up one's own bowels in such a case, wipes away every stain on the character. The guards of the Russian captives not only used every precaution against this, but carefully watched over their health and comfort, carrying them over the shallowest pools and streamlets, lest their feet should be wet, and assiduously beating off the gnats and flies, which would have been annoying. At every village, crowds of both sexes, young and old, turned out to see these unfortunate men; but there was nothing like insult or mockery

* *Sagi* is the strong drink of Japan, distilled from rice.

in the demeanour of any—pity appeared to be the universal feeling: many begged permission from the guards to offer sagi, comfits, fruits, and other delicacies; and these were presented often with tears of compassion, as well as gestures of respect.

The prison to which Golownin and his companions were finally committed had been constructed expressly for their habitation in the town of Matsmai. It was a quadrangular wooden building, 25 paces long, 15 broad, and 12 feet high. Three sides of it were dead-wall, the fourth was formed of strong spars. Within this structure were two apartments, formed likewise of wooden spars, so as to resemble cages: one was appropriated to the officers, the other to the sailors and Alexei. The building was surrounded by a high wall or paling, outside of which were the kitchen, guard-house, &c., enclosed by another paling. This outer enclosure was patrolled by common soldiers; but no one was allowed within, except the physician, who visited daily, and the orderly officers, who looked through the spars every half-hour. Of course, it was rather a cold lodging; but, as winter advanced, a hole was dug a few feet from each cage, built round with freestone, and filled with sand, upon which charcoal was afterwards kept burning. Benches were provided for them to sleep on, and two of the orderlies presented them with bear-skins; but the native fashion is to lie on a thick, wadded quilt, folded together, and laid on the floor, which, even in the poorest dwellings, is covered with soft straw-mats. A large wadded dress, made of silk or cotton, according to the circumstances of the wearer, serves for bed-clothes—which seem to be quite unknown; and while the poorer classes have only a piece of wood for a pillow, the richer fasten a cushion on the neat boxes which contain their razors, scissors, pomatum, tooth-brushes, and other toilet requisites.

But while the comfort of the captives was attended to in many minor matters, there was no relaxation of the vigilance used to preclude the possibility of self-destruction. They were not allowed scissors or knife to cut their nails, but were obliged to thrust their hands through the palisades, to get this office performed for them. When they were indulged with smoking, it was with a very long pipe held between the spars, and furnished with a wooden ball fixed about the middle, to prevent its being drawn wholly within the cage.

For weeks together they were brought daily before the bunyo (governor of the town, and probably lord-lieutenant of all the Japanese Kurile Islands), bound and harnessed like horses as before. The ostensible object of these examinations, which frequently lasted the whole day, was to ascertain for what purpose they had come near Japan, and what they knew of Resanoff and Chwostoff—for a singularly unfortunate combination of circumstances had arisen to give colour to the suspicion, that some of their party had been connected with that expedition. But for one inquiry connected with the case, there were fifty that were wholly irrelevant, and prompted by mere curiosity. The most trivial questions were put several times and in different forms, and every answer was carefully written down. Golownin was often puzzled, irritated, and quite at the end of his stock of patience; but that of the interrogators appeared interminable. They said, that by writing down everything they were told, whether true or false, and comparing the various statements they received, they were enabled through time to separate truth from fiction, and the practice was very improving. At the close of almost every examination, the bunyo exhorted them not to despair, but to offer up prayers to Heaven, and patiently await the emperor's decision.

Presently new work was found for them. An intelligent young man was brought to their prison, to be taught the Russian language. To this the captain consented, having no confidence in the Kurile Alexei as an interpreter, and being desirous himself to gain

some knowledge of Japanese. Teske made rapid progress, and soon became a most useful and kindly companion to the captives. Books, pens, and paper were now allowed them in abundance; and their mode of treatment was every way improved. But by and by, they were threatened with more pupils; a geometrician and astronomer from the capital was introduced to them, and would gladly have been instructed in their mode of taking observations. Other learned men were preparing to follow, and it was now evident that the intention of the Japanese government was to reconcile them to their lot, and retain them for the instruction of the nation. Indeed, this appears to be the great secret of the policy of detaining for life instead of destroying the hapless foreigners that light on these shores; as the avowed motive for tolerating the commercial visits of the Dutch is, that they furnish the only news of public events that ever reach Japan. Fearful of becoming known to other nations for fear of invasion, they are yet greedy of information respecting them, and many were the foolish questions they asked Golownin about the emperor of Russia, his dress, habitation, forces, and territories.

Golownin, on his part, endeavoured to elicit all the information he could gain with respect to the numbers, resources, government, and religion of this singular people. He found it impossible to ascertain the amount of the population; indeed, it seems it would be very difficult for the government itself to obtain a census, for millions of the poor live abroad in the streets, fields, or woods, having no spot which they can call a home. Teske shewed a map of the empire, having every town and village marked on it; and though on a very large scale, it was thickly covered. He pointed out on it a desert, which is considered immense, because litters take a whole day to traverse it, and meet with only one village during the journey. It is perhaps fifteen miles across. The city of Yedo was usually set down by Europeans as containing 1,000,000 inhabitants; but Golownin was informed, that it had in its principal streets 280,000 houses, each containing from 30 to 40 persons; besides all the small houses and huts. This would give in the whole a population of above 10,000,000 souls—about a fourth part of the estimated population of this country! The incorporated society of the blind alone is affirmed to include 36,000.

The country, though lying under the same latitudes as Spain and Italy, is yet very different from them in climate. At Matsmai, for instance, which is on the same parallel as Leghorn, snow falls as abundantly as at St Petersburg, and lies in the valleys from November till April. Severe frost is uncommon, but cold fogs are exceedingly prevalent. The climate, however, is uncommonly diversified, and consequently so are the productions, exhibiting in some places the vegetation of the frigid zone, and in others that of the tropics.

Rice is the staple production of the soil. It is nearly the only article used instead of bread, and the only one from which strong liquor is distilled, while its straw serves for many domestic purposes. Besides the radishes already mentioned, there is an extensive cultivation of various other esculent roots and vegetables. There is no coast without fisheries, and there is no marine animal that is not used for food, save those which are absolutely poisonous. But an uncommonly small quantity suffices for each individual. If a Japanese has a handful of rice and a single mouthful of fish, he makes a savoury dish with roots, herbs, or mollusca, and it suffices for a day's support.

Japan produces both black and green tea; the former is very inferior, and used only for quenching thirst; whereas the latter is esteemed a luxury, and is presented to company. The best grows in the principality of Kioto, where it is carefully cultivated for the use both of the temporal and spiritual courts. Tobacco, which was first introduced by the European missionaries, has

spread astonishingly, and is so well manufactured, that our author smoked it with a relish he had never felt for a Havana cigar. The Japanese smokes continually, and sips tea with his pipe, even rising for it during the night.

All articles of clothing are made of silk or cotton. The former appears to be very abundant, as rich dresses of it are worn even by the common soldiers on festive days; and it may be seen on people of all ranks even in poor towns. The fabrics are at least equal to those of China. The cotton of Japan seems to be of the same kind as that of our West Indian colonies. It furnishes the ordinary dress of the great mass of the people, and also serves all the other purposes for which we employ wool, flax, furs, and feathers. The culture of it is, of course, very extensive; but the fabrics are all coarse: Golownin could hardly make himself believe that his muslin cravat was of this material. There is some hemp, which is manufactured into cloth for sails, &c.; but cables and ropes, very inferior to ours, are made from the bark of a tree called kadyz. This bark likewise supplies materials for thread, lamp-wicks, writing-paper, and the coarse paper used for pocket-handkerchiefs.

There is no lack of fruit-trees, as the orange, lemon, peach, plum, fig, chestnut, and apple; but the vine yields only a small, sour grape, perhaps for want of culture. Timber-trees grow only in the mountainous districts, which are unfit for cultivation. Camphor is produced abundantly in the south, and large quantities of it are exported by the Dutch and Chinese. The celebrated varnish of Japan, drawn from a tree called silz, is so plentiful, that it is used for lacquering the most ordinary utensils. Its natural colour is white, but it assumes any that is given to it by mixture. The best varnished vessels reflect the face as in a mirror, and hot water may be poured into them without occasioning the least smell.

The chief domestic animals are horses and oxen for draught; cats and dogs are kept for the same uses as with us; and swine furnish food to the few sects who eat flesh. Sheep and goats seem to be quite unknown: the Russian captives had to make drawings of the former, to convey some idea of the origin of wool.

There are considerable mines of gold and silver in several parts of the empire, but the government does not permit them to be all worked, for fear of depreciating the value of these metals. They supply, with copper, the material of the currency, and are also liberally used in the decoration of public buildings, and in the domestic utensils of the wealthy. There is a sufficiency of quicksilver, lead, and tin, for the wants of the country; and one island is entirely covered with sulphur. Copper is very abundant, and of remarkably fine quality. All kitchen utensils, tobacco-pipes, and fire-shovels, are made of it; and so well made, that our author mentions his tea-kettle as having stood on the fire, like all other Japanese kettles, day and night for months, without burning into holes. This metal is likewise employed for sheathing ships, and covering the joists and flat roofs of houses. Iron is less abundant, and much that is used is obtained from the Dutch. Nails alone, of which immense numbers are used in all carpentry-work, consume a large quantity. Diamonds, corallians, jaspers, some very fine agates, and other precious stones, are found; but the natives seem not well to understand polishing them. Pearls are abundant; but not being considered ornamental, they are reserved for the Chinese market.

Steel and porcelain are the manufactures in which the Japanese chiefly excel, besides those in silk-stuffs and lacquered ware already mentioned. Their porcelain is far superior to the Chinese, but it is scarce and dear. With respect to steel manufactures, the sabres and daggers of Japan yield only perhaps to those of Damascus; and Golownin says their cabinet-makers' tools

might almost be compared with the English. In painting, engraving, and printing, they are far behind; and they seem to have no knowledge of ship-building or navigation beyond what suffices for coasting voyages, though they have intelligent and enterprising sailors. There is an immense internal traffic, for facilitating which there are good roads and bridges where water-carriage is impracticable. These distant Orientals have likewise bills of exchange and commercial gazettes. The emperor enjoys a monopoly of the foreign commerce.

It is popularly said, that Japan has two emperors—one spiritual, and the other temporal. The former, however, having no share in the administration of the empire, and seldom even hearing of state affairs, is no sovereign according to the ideas we attach to that term. He seems to stand much in the same relation to the emperor that the popes once did to the sovereigns of Europe. He governs Kioto as a small independent state; receives the emperor to an interview once in seven years; is consulted by him on extraordinary emergencies; receives occasional embassies and presents from him, and bestows his blessing in return. His dignity, unlike that of the Roman pontiffs, is hereditary, and he is allowed twelve wives, that his race may not become extinct. According to Japanese records, the present dynasty, including about 130 Kin-reys, has been maintained in a direct line for above twenty-four centuries. The person of the Kin-rey is so sacred, that no ordinary mortal may see any part of him but his feet, and that only once a year; every vessel which he uses must be broken immediately; for if another should even by accident eat or drink out of it, he must be put to death. Every garment which he wears must be manufactured by virgin hands, from the earliest process in the preparation of the silk.

The adherents of the aboriginal Japanese religion, of which the Kin-rey is the head, adore numerous divinities called Kami, or immortal spirits, to whom they offer prayers, flowers, and sometimes more substantial gifts. They also worship Kadotski, or saints—mortals canonised by the Kin-rey—and build temples in their honour. The laws concerning personal and ceremonial purity, which form the principal feature of this religion, are exceedingly strict, not unlike those imposed on the ancient Jews. There are several orders of priests, monks, and nuns, whose austerity, like that of Europe, is maintained in theory more than in practice.

Three other creeds, the Brahminical, the Confucian, and that which deifies the heavenly bodies, have many adherents; but their priests all acknowledge a certain religious supremacy to exist in the Kin-rey. There is universal toleration in these matters; every citizen may profess what faith he chooses, and change it as often as he chooses, without any one inquiring into his reasons; only it must be a spontaneous choice, for proselyting is forbidden by law. Christianity alone is proscribed, and that on account of the political mischief said to have been effected through its adherents in the seventeenth century. There is a law, by which no one may hire a servant without receiving a certificate of his not being a Christian; and on New-Year's Day, which is a great national festival, all the inhabitants of Nangasaki are obliged to ascend a staircase, and trample on the crucifix, and other insignia of the Romish faith, which are laid on the steps as a test. It is said that many perform the act in violation of their feelings. So much of the religious state of the empire Golownin elicited in conversation with Teske and others; but everything on this subject was communicated with evident reluctance; and though in the course of the walks which they were permitted to take in harness, the Russian captives sometimes saw the interior of the temples, they were never permitted to enter while any religious rites were celebrated.

With respect to the civil administration of Japan, our author seems to have gathered little that was

absolutely new to us. The empire comprises above 200 states, which are governed as independent sovereignties by princes called Damos, who frame and enforce their own laws. Though most of these principalities are very small, some of them are powerful: the damyo of Sindai, for instance, visits the imperial court with a retinue of 60,000. Their dependence on the emperor appears chiefly in their being obliged to maintain a certain number of troops, which are at his disposal. Those provinces which belong directly to the emperor, are placed under governors called Bunyos, whose families reside at the capital as hostages. Every province has two bunyos, each of whom spends six months in the government and six at Yedo.

The supreme council of the emperor consists of five sovereign princes, who decide on all ordinary measures without referring to him. An inferior council of fifteen princes or nobles presides over important civil and criminal cases. The general laws are few and well known. They are very severe; but the judges generally find means of evading them where their enforcement would involve a violation of those of humanity. In some cases, as in conjugal infidelity or filial impiety, individuals are permitted to avenge their own wrong, even to the taking of life. Civil cases are generally decided by arbitrators, and only when they fail to settle a matter is there recourse to the public courts of justice. Taxes are generally paid to the reigning prince or emperor, in tithes of the agricultural, manufactured, or other productions of the country.

Such were some of the leading particulars ascertained by Golownin concerning the social and civil condition of this singular people. He says, they always appeared very happy, and their demeanour was characterised by lively and polite manners, with the most imperturbable good temper. It seems at length to have been through fear of a Russian invasion, rather than from any sense of justice, that his Japanese majesty, in reply to the importunities of the officers of the *Diana*, consented to release the captives, on condition of receiving from the Russian government a solemn disavowal of having sanctioned the proceedings of Chwostoff. Having obtained this, the officers repaired for the fourth time to these unfriendly shores, and enjoyed the happiness of embracing their companions, and taking them on board.

THINGS TALKED OF IN LONDON.

July 1862.

WHEN we shall have a constant supply of pure water—a complete system of efficient and innoxious sewers—a service of street hydrants—when the Thames shall cease to be the *cloaca maxima*, are questions to which, however seriously asked, it is not easy to get an answer. Add to these grievances, the delay of proper regulations for abolishing intramural interments, and the fact that Smithfield is not to be removed further than Copenhagen Fields—a locality already surrounded with houses—and it will occasion no surprise that the authorities are treated with anything but compliments.

The laying down of an under-sea telegraph wire across the Irish Channel, may be taken as a new instance of the indifference consequent on familiarity. When the line was laid from Dover to Calais, the whole land rang with the fact; but now the sinking of a wire three times the length, in a channel three times the width, excites scarcely a remark, and seems to be looked on as a matter of course. The wire, which is eighty miles in length, is said to weigh eighty tons. It was payed out and sunk from the deck of the *Britannia*, at the rate of from three to five miles an hour, and was successfully laid, from Holyhead to Howth, in from twelve to fifteen hours; and now a message may be flashed from Trieste to Galway in a period brief enough to satisfy the most impatient. The

means of travel to the East, too, are becoming tangible in the Egyptian railway, of which some thirty miles are in a state of forwardness, besides which a hotel is to be built at Thebes; so that travellers, no longer compelled to bivouac in the desert, will find a teeming larder and well-aired beds in the land of the Sphinxes. And, better still, among a host of beneficial reforms to take place in our Customs' administration, there is one which provides that the baggage of travellers arriving in the port of London shall be examined as they come up the river, instead of being sent to the Custom-house.

By a report of the Astronomer-royal to the Board of Visitors, who have lately made their annual inspection of the Greenwich Observatory, we are informed of a singular fact, that observations of the pole-star shew that its position varies some three or four seconds on repeating the observations at intervals of a few months, and this notwithstanding the extreme accuracy of the transit circle. The only explanation which can as yet be given for this phenomenon is, that the earth, solid as it appears, is liable to slight occasional movements or oscillations.

We shall know, in a few weeks, the result of the telegraphic correspondence with the Observatory at Paris—one interesting point being, as to whether the respective longitudes, as at present determined, will be verified by the galvanic test. Besides which, Greenwich time is to be sent every day to London, where a pole, with a huge sliding-ball, has been fixed on the top of the Telegraph Office, near Charing Cross. This ball is to be made to descend at one o'clock simultaneously with the well-known ball which surmounts the Observatory; and thus scientific inquirers—to say nothing of the crowds who will daily throng the footways of the Strand to witness the downcome—will be informed of the true time, while, by means of the wires, it may be flashed to all parts of the kingdom.

The lecture with which Professor Faraday wound up the course at the Royal Institution may be mentioned here, seeing that it adds somewhat to our knowledge of the theory and phenomena of magnetism. As usual, the lecture-room was crowded; and those who could not understand, had at least the satisfaction of being able to say they were present. Mr Faraday, who, enlarging upon his view, announced, a short time since, that there are such things as magnetic lines of force, now contends that these lines have a 'physical character'—a point most satisfactorily proved by sundry experiments during the lecture. The inquiry is one, as Mr Faraday observes, on the 'very edge of science,' trenching on the bounds of speculation; but such as eminently to provoke research. The phenomena, he says, 'lead on, by deduction and correction, to the discovery of new phenomena; and so cause an increase and advancement of real physical truth, which, unlike the hypothesis that led to it, becomes fundamental knowledge, not subject to change.' A chief point of discussion to which the investigations have led is: Whether the phenomena of what we call gravity may not be resolvable into those of magnetism—a force acting at a distance, or by lines of power. 'There is one question,' continues Mr Faraday, 'in relation to gravity, which, if we could ascertain or touch it, would greatly enlighten us. It is, whether gravitation requires time. If it did, it would shew undeniably that a physical agency existed in the course of the line of force. It seems equally impossible to prove or disprove this point; since there is no capability of suspending, changing, or annihilating the power (gravity), or annihilating the matter in which the power resides. The lines of magnetic force may have 'a spiritual existence,' but as yet we are unable to tell whether these lines 'are analogous to those of gravitation; acting at a distance; or whether, having a physical existence, they are more like in their nature to those of electric induction or the electric current.' Mr

Faraday inclines at present to the latter view. He 'affirms' the lines of magnetic force from actual experiment, and 'advocates' their physical nature 'chiefly with a view of stating the question of their existence; and though,' he adds, 'I should not have raised the argument unless I had thought it both important and likely to be answered ultimately in the affirmative, I still hold the opinion with some hesitation, with as much, indeed, as accompanies any conclusion I endeavour to draw respecting points in the very depths of science—as, for instance, one, two, or no electric fluids; or the real nature of a ray of light; or the nature of attraction, even that of gravity itself; or the general nature of matter.' These are profound views; but we may reasonably conclude, that, however obscure they may at present appear, they will in time be cleared up and further developed by the gifted philosopher from whom they emanate.

Of minor matters which have been more or less talked about, there is the Library for the Working-Classes, just opened in the parish of St Martin-in-the-Fields—a praiseworthy example for other parishes, but not to be followed unless the readers actually exist, and manifest the sort of want which books alone can satisfy. A suggestion has been made, to use for books in hot climates, where paper is liable to rapid decay, the sheet-iron exhibited at Breslau, which is as thin and pliant as paper, and can be produced at the rate of more than 7000 feet to the hundredweight. This would be something new in the application of metal. Metallurgy generally is being further investigated by Leonhard of Heidelberg, who has just called on manufacturers to aid him in his researches, by sending him specimens of scoriae, particularly of those which are crystallised. Then there is Mr Hesketh's communication to the Institute of British Architects, 'On the Admission of Daylight into Buildings, particularly in the Narrow and Confined Localities of Towns;' in which, after shewing that the proportion of light admitted to buildings is generally inadequate to their cubical contents, and means for estimating the numerical value of that which really does enter, he states that the defect may be remedied by the use of reflectors, contrived so as to be 'neither obstructive nor unsightly.' He explains, that 'a single reflector may generally be placed on either the outside or inside of a window or skylight, so as to throw the light from the (perhaps small) portion of sky which remains unobscured overhead, to any part in which more light is required.' Such difficulties of position or construction as present themselves, 'may be overcome in almost every case, by, as it were, cutting up the single reflector into strips, and arranging them one above the other, either in the reveal of the window, or in some other part where it will not interfere with ventilation, or the action of the sashes.' This is adopting the principle on which improved lighthouse reflectors are constructed; and we are told, that 'the combinations may be arranged horizontally, vertically, or obliquely, according to the positions of the centre of the unobscured portion of sky, and of the part into which the light is to be thrown, and according to the shape of the opening in which the combination is to be placed.' As a case in point, it was mentioned that a reflector 'had been fitted to a vault (at the Depot Wharf, in the Borough) ninety-six feet in depth from front to back. The area into which the window opens is a semicircle, with a heavy iron-grating over it; and the result is, that small print can be easily read at the far end of the vault.' It is a fact worth knowing, that reflectors may be so constructed as to throw all the available daylight into any required direction; and in one instance the reflector may be made to serve at the same time as a dwarf venetian window-blind. Instead of wooden splats or laths, flat glass tubes or prisms are used, fitted into the usual framework, and these being silvered on the inside, throw all the light

that falls on them into the room, when placed at the proper angle.

Again, the possibility of locomotion without the aid of steam is talked about, and the New Yorkers are said to be about to send over a large ship driven by Ericsson's caloric engine, which is to prove as powerful as vapour at one-half of the cost—a fact of which we shall be better able to judge when the vessel really arrives. Then, looking across the Channel, we find the Abbé Moigno proposing to construct and establish a relief model of Europe in the Bois de Boulogne at Paris, of a size to cover several acres, and with the railways of iron, and the rivers of water, by which means one of the most interesting and instructive of sights would be produced, and the attractions of the French capital greatly increased. A desirable project—but the cost! The Montyon prize of 2000 francs has been awarded to M. Mosson, for his method of drying and preserving vegetables for long sea voyages, as published a few months ago. M. Naudin states, that a certain kind of furze or thistle, of which cattle are very fond, may be made to grow without thorns—an important consideration, seeing that at present, before it can be used as food, it has to undergo a laborious beating, to crush and break the prickles with which it is covered. As the plant thrives best on poor soils, which might otherwise lie useless, the saving of this labour will be a great benefit to the French peasantry; and the more so, as it appears the plant will grow in its new state from seed. M. Naudin believes, that the condition of other vegetable productions may be varied at pleasure, and promises to lay his views shortly before the Académie. M. Lecoq, director of the Botanical Garden at Claremont, informs the same body of something still more extraordinary, in a communication, entitled 'Two Hundred, Five Hundred, or even a Thousand new Vegetables, created *ad libitum*.' Having been struck by the fact, that the ass so often feeds upon the thistle, he took some specimens of that plant, and, by careful experiment, has succeeded in producing for the table 'a savoury vegetable, with thorns of the most inoffensive and flexible sort.' Whatever be the kind of thistle, however hard and sharp its thorns, he has tamed and softened them all, his method of transformation being, as he says, none other than exposing the plants to different influences of light. Those which grew unsheltered, he places in the dark, and *vice versa*. Familiar examples are given in the celery, of which the acrid qualities are removed by keeping off the light; while the pungency of cress, parsley, &c., is increased by exposure to the sun. M. Lecoq has not yet detailed all his experiments; but he asserts that, before long, some of our commonest weeds, owing to his modifications, will become as highly esteemed as peas or asparagus. Let him shew that his process is one that admits of being applied cheaply and on a large scale, and he will not fail of his reward.

A QUALIFIED INSTRUCTOR.

It will be found that the ripest knowledge is best qualified to instruct the most complete ignorance. It is a common mistake to suppose that those who know little suffice to inform those who know less; that the master who is but a stage before the pupil can, as well as another, shew him the way; nay, that there may even be an advantage in this near approach between the minds of teacher and of taught; since the recollection of recent difficulties, and the vividness of fresh acquisition, give to the one a more living interest in the progress of the other. Of all educational errors, this is one of the gravest. The approximation required between the mind of teacher and of taught is not that of a common ignorance, but of mutual sympathy; not a partnership in narrowness of understanding, but that thorough insight of the one into the other, that orderly analysis of the tangled skein of thought; that patient and masterly skill in developing conception after conception.

with a constant view to a remote result, which can only belong to comprehensive knowledge and prompt affections. With whatever accuracy the recently initiated may give out his new stores, he will rigidly follow the precise method by which he made them his own; and will want that variety and fertility of resource, that command of the several paths of access to a truth, which are given by thorough survey of the whole field on which he stands. The instructor needs to have a full perception, not merely of the internal contents, but also of the external relations, of that which he unfolds; as the astronomer knows but little, if, ignorant of the place and laws of moon and sun, he has examined only their mountains and their spots. The sense of proportion between the different parts and stages of a subject; the appreciation of the size and value of every step; the foresight of the direction and magnitude of the section that remains, are qualities so essential to the teacher, that without them all instruction is but an insult to the learner's understanding. And in virtue of these it is that the most cultivated minds are usually the most patient, most clear, most rationally progressive; most studious of accuracy in details, because not impatiently shut up within them as absolutely limiting the view, but quietly contemplating them from without in their relation to the whole. Neglect and depreciation of intellectual minutiae are characteristics of the ill-informed; and where the granular parts of study are thrown away or loosely held, will be found no compact mass of knowledge, solid and clear as crystal, but a sandy accumulation, bound together by no cohesion, and transmitting no light. And above and beyond all the advantages which a higher culture gives in the mere system of communicating knowledge, must be placed that indefinable and mysterious power which a superior mind always puts forth upon an inferior; that living and life-giving action, by which the mental forces are strengthened and developed, and a spirit of intelligence is produced, far transcending in excellence the acquisition of any special ideas. In the task of instruction, so lightly assumed, so unworthily esteemed, no amount of wisdom would be superfluous and lost; and even the child's elementary teaching would be best conducted, were it possible, by Omniscience itself. The more comprehensive the range of intellectual view, and the more minute the perception of its parts, the greater will be the simplicity of conception, the aptitude for exposition, and the directness of access to the open and expectant mind. This adaptation to the humblest wants is the peculiar triumph of the highest spirit of knowledge.—*Martineau's Discourses.*

AN AMERICAN RIVER.

The picturesque banks of the river Connecticut are dotted with charming little villages, that break here and there upon the sight like feathers of light, dancing among the willow leaves; there is such a dazzling irregularity of house and hill—so much fairy-like confusion of vista, landscape, and settlement. Now we pass a tiny white and vine-clad cottage, that looks as if it had been set down yesterday; now we sweep majestically by an ambitious young town, with its two, three, or half-a-dozen church-spires, sending back the lines of narrow light into the water; anon we glide past a forest of majestic old trees, that seem to press their topmost buds against the fleecy clouds floating in the blue sky; and through these forests we catch glimpses of the oriole, dashing through the boughs like a flake of fire.—*Yankee Stories, by Howard Paul.*

CHOOSE THE SUNNY SIDE OF THE STREET.

The sunny side of the street should always be chosen as a residence, for its superior healthfulness. In some barracks in Russia, it was found that in a wing where no sun penetrated, there occurred three cases of sickness for every single case which occurred on that side of the building exposed to the sun's rays. All other circumstances were equal—such as ventilation, size of apartments, &c., so that no other cause for this disproportion seemed to exist. In the Italian cities, this practical hint is well known. Malaria seldom attacks the set of apartments or houses which are freely open to the sun; while, on the opposite side of the street, the summer and autumn are very unhealthy, and even dangerous.

A DREAM OF DEATH.

'WHERE shall we sail to-day?'

Thus said, methought,
A Voice—that could be only heard in dreams:
And on we glided without mast or oars,
A fair strange boat upon a wondrous sea.

Sudden the land curved inward, to a bay
Broad, calm; with gorgeous sea-flowers waving slow
Beneath the surface—like rich thoughts that move
In the mysterious deep of human hearts.

But towards the rounded shore's embracing arm,
The little waves leaped, singing, to their death;
And shadowy trees drooped pensive over them,
Like long-fringed lashes over sparkling eyes.

So still, so fair, so rosy in the dawn
Lay that bright bay: yet something seemed to breathe,
Or in the air, or trees, or lipping waves,
Or from the Voice, ay near as one's own soul—

'There was a wreck last night!'

A wreck?—and where
The ship, the crew?—All gone. The monument
On which is writ no name, no chronicle,
Laid itself o'er them with smooth crystal smile.

'Yet was the wreck last night!'

And, gazing down,
Deep down beneath the surface, we were 'ware
Of cold dead faces, with their stony eyes
Uplooking to the dawn they could not see.

One stirred with stirring sea-weeds: one lay prone,
The tinted fishes glancing o'er his breast:
One, caught by floating hair, rocked daintily
On the reed-cradle woven by kind Death.

'The wreck has been,' then said the deep low Voice,
(Than which not Gabriel's did diviner sound,
Or sweeter—when the stern, meek angel spake:
'See that thou worship not! Not me, but God!')

'The wreck has been, yet all things are at peace,
Earth, sea, and sky. The dead, that while we slept
Struggled for life, now sleep and fear no storm:
O'er them let us not weep when God's heaven smiles.'

So we sailed on above the diamond sands,
Bright sea-flowers, and dead faces white and calm,
Till the waves rocked us in the open sea,
And the great sun arose upon the world.

THE EXECUTIONER IN ALGERIA.

Every day, morning and evening, says our widow, 'I see a Moor pass along the street; all his features beam with kindness and serenity. A sword, or rather a long yataghan, is slung in his girdle; all the Arabs salute him with respect, and press forward to kiss his hand. This man is a *chameel* or executioner—an office considered so honourable in this country, that the person invested with it is regarded as a special favourite of Heaven, intrusted with the care of facilitating the path of the true believer from this lower world to the seventh heaven of Mohammed.—*A Resident in Algeria, by Madame Prus.*

PRICE 1½d.

THE SULTAN'S BEAR.*

THE sultan being one day rather out of sorts, sent for his Jewish physician, a man very eminent for skill in his profession, and not less distinguished by his love of his own nation and his desperate enmity to the Christians. Finding that his patient had not really much the matter with him, and thinking a little gossip would not only be more agreeable, but more likely to do him good, than any medicine which could be prescribed, the doctor began to discourse on the very familiar topic of his highness's favourite bear, which was lying at his feet, and whose virtues and abilities he was never tired of extolling.

'You would wonder,' said the sultan, 'not only at the natural sagacity of the creature, and the tact which he shews in a thousand different ways, but at the amount of knowledge he has collected, and the logical correctness with which he uses it. He is really a very knowing beast.' The Jew politely acquiesced in all this and much more; but at length added: 'It is well that such a clever animal is in such good hands. If his extraordinary talents are not developed to the utmost, they are at least not perverted and made a bad use of.'

'I hope not, indeed,' said the sultan. 'But what do you mean by his talents not being developed? or in what way would they be likely to be perverted in bad hands?'

'Pardon me,' said the Jew; 'I have spoken rashly before your sublime highness—such things should not be talked of; but it is natural that, although I know very little about them, I should consider the practice and the purpose bad, when they belong to what I consider a bad people: at the same time, if your sublime highness thinks fit to tolerate them, it is not for your faithful slave to say a word about it. I should be sorry that your sublime highness should not extend to your Christian subjects the same toleration and paternal kindness my own people enjoy.'

'What in the world do you mean?' said the sultan. 'What have the Christians to do with my bear?'

'Nothing at all,' replied the Jew with great earnestness; and he added, with a sigh, 'that is the very thing I am thankful for. It is such a remarkable creature, that there is no saying what might come of it.'

'Come of what?' said the sultan.

'Why,' said the Jew, in a humble and very confidential tone, 'your sublime highness is of course aware, that among the many curious secrets the Christians possess, they have one which enables them to teach bears to read.'

'You don't say so?' exclaimed the sultan. 'How do they contrive it?'

'Ah,' replied the Jew with an internal shudder, 'that is more than I can tell your sublime highness. I don't suppose that half-a-dozen of your subjects, except themselves, are aware of the fact; and few even among the Christians know the secret. I only obtained the little knowledge I have by accidental circumstances, which put me upon the inquiry; and I was a long while before I could feel perfectly certain that they actually did the thing. *How* they did it, and *why*, I have never been able to learn. It is one of their greatest secrets, one of their deepest, and therefore, I suspect, one of their most pernicious mysteries. I do not suppose that any man among them would confess it to save his life—not even the old patriarch, if he were put to the rack.'

'It is very strange,' said the sultan, after a pause.

'It is wonderful,' said the physician with much emphasis.

'What is the harm of it?' exclaimed the sultan abruptly after a pause. 'Why should not bears read as well as men, if they are capable of learning?'

'Most true and most wisely said,' replied the Jew. 'If they were taught to read good books, it would probably mend their manners. But if that were all, why should there be so much mystery about it? why should these people do it so secretly, and deny it so stoutly?' and again he shook his head, and shuddered. But being fully persuaded that he had gained his point, he thought it safest to change the subject; and accordingly he did so as soon as he had emphatically and earnestly entreated the sultan not to say a word of the secret he had been led to impart, or, at all events, not to let it be known that he had given any information on the subject.

When the doctor was gone, the sultan fell into a reverie on the advantages and disadvantages of his bear learning to read. When he went to bed, the same train of thought kept him awake; and after a sleepless night, he sent early in the morning for the patriarch. The venerable Mar Yusef lost no time in obeying the summons. Taking his patriarchal staff in his hand, and followed by his two deacons with their heads bare, and their hands crossed on their bosoms, he silently bent his way towards the palace, pondering in his mind on all the various things he could think of as possible causes for his being wanted by the sultan. The sultan dismissed all his attendants; and as soon as he and the patriarch were alone, he beckoned him to approach, and when the aged ecclesiastic had come quite close, and again bowed, not only out of respect, but instinctively, as one does who expects a whisper,

* This is in substance a tradition still current among those Eastern Christians who are 'dwellers in Mesopotamia.'

the sultan said in a low, earnest tone: 'You know my bear?'

'I do, please your sublime highness,' replied Mar Yusef; 'and a very fine bear he is.'

'I know that,' answered the sultan; 'but the matter is this,' and he lowered his voice, and increased the earnestness of his tone: 'You must teach him to read.'

'To read!' exclaimed the patriarch, thunderstruck. 'To read! the thing is impossible.'

'Of course, I knew you would say that,' said the sultan; 'you must do it, however, or it will be the worse for you and for all your people.'

'Most willingly would I do that, or anything lawful, to shew my respect for your sublime highness,' said the astonished patriarch; 'but, as I have already had the honour to observe, the thing is impossible.'

'Don't tell me,' said the sultan. 'I know more about the matter than you imagine. There is no use in trying to conceal it. I know upon undoubted authority, that you have taught bears, and many of them, I daresay, of less capacity than mine. I shall send him to you this evening, and if you do not bring him back in six weeks able to read, it will be as I have already told you—at your peril, and to the ruin of all that belong to you. So, now, do not waste time, for I am quite in earnest about it; but go and make preparations to receive him, for he has been used to courteous treatment.'

This speech was accompanied by a wave of the hand, which precluded all reply, and the troubled patriarch silently and slowly withdrew.

'My children,' said the patriarch on his way home, addressing the two young men who were supporting him, 'the sultan has resolved to destroy us, and all the Christians in his dominions. He is seeking occasion against us. He does not make open war upon us; but he secretly commands us to do what is impossible, in order that he may have a pretext for our destruction. He requires that in six weeks we should teach his bear to read!'

'The old brute!' exclaimed the deacon Timothy.

'My father,' said the other deacon, Titus, 'suffer me to speak.'

'Speak, my son,' replied the aged man, in a voice scarcely articulate, while he gently withdrew his hand, and laid it on the deacon's head; 'what wouldst thou say?'

'Under favour, most dear and reverend father,' replied Titus, 'I would say that, whatever the sultan's design may be, you should not be discouraged; and that if you will only do one thing, which I earnestly entreat you to do, I will cheerfully undertake all the rest, and I doubt not that we may get clear through this difficulty.'

'What would you have me do, my son?' said the patriarch.

'Just this,' replied the deacon, 'if I may be permitted to advise: go back to the sultan as quickly as possible, and say that, on consideration, you are sorry that you hesitated—that you will be happy to receive his bear—that you will do your best, and hope to give him satisfaction in the matter.'

'What! my son,' said the patriarch, 'would you have me go to the sultan, and undertake to teach his bear to read? You do not know how difficult it is even to teach young children.' But the deacon pleaded so earnestly, that his superior at length consented; and returning to the palace, the patriarch signified to the sultan, that he had thought better of the subject, and was willing to do anything in his power to give his sublime highness satisfaction.

'No doubt you can, if you will,' said the sultan hastily, but not in ill-humour; 'and I expect you to do it—you might as well have agreed to it at once.'

When the patriarch was at home, seated in his arm-chair, with his deacons standing on each side, and a

little recovered from the fatigue of the walk, he turned to Titus, and said: 'Well, my son, and what am I to do now?'

'Nothing, my father,' replied the deacon cheerfully. 'You have done all I asked you to do, and what remains I will readily undertake.'

So he made his bow, and set off to make his arrangements. He chose a little square room up one pair of stairs in the north turret, and parted off about a third of it with strong horizontal bars, six inches apart. The two lowest bars were movable, and the spaces between them left open, to admit air and light, as well as to allow the inmate to go in and be brought out at the pleasure of his keepers; but all above them were boarded over, except that one which was of such a height as would be about even with the bear's head when he should stand on his hind legs. This space was left open along the whole length of the den, so that, in any part of it, he could very conveniently put forth his nose far enough to look about him.

'And now,' said Titus to his comrade Timothy, when he had completed these preparations, 'I must go to seek for a book and a desk; and if they bring the bear before I come back, will you be so good as to see him put in, and also to mind that the other end of the chain, which I have padlocked to the staple in the wall, is fastened to his collar, and is long enough to allow of his lying down comfortably in the straw, and taking a little turn backwards and forwards, if he likes? and don't let them give him anything to eat, and take care not to be out of the way—that is a good fellow.'

'You may depend upon me,' said Timothy; and Titus went off to the church, to see about a lectionary, for the bear to study, though, to say the truth, not entirely, or even principally, with that intention; for he did not mean that his pupil should commence that day, or the next; and he was in no doubt which to choose among many old lectionaries that had been laid aside. There was an immense one, with great brass knobs and corners, out of which he had himself learned to chant long before he could lift it, and indeed, now that he was come to man's estate, it was as much as he could carry. This book he meant to use; but for the present he contented himself with observing from the window the bear coming to school in procession; and when he was satisfied that his pupil was in safe custody, he descended from the church-tower, and went to see after him. When he came to the door of the apartment, he waited a moment to listen to what seemed an interchange of anything but civilities between Timothy and his charge. Titus called out his colleague; and, without going in himself, locked the door, and put the key in his pocket.

'Won't you go in and look at him?' said Timothy, as they went down the staircase together.

'Time enough,' said Titus; 'he will be better by himself just at present. Had you much trouble in getting him in? How did he behave?'

'Rather restive,' replied Timothy; 'but we managed it among us. Should not he have something to eat?'

'No,' said Titus; 'he has got plenty of water; he will do very well. But now come and help me down with the old lectionary from the upper vestry, for I don't think I can get it down that staircase myself.' Between them the lectionary was safely brought down, and deposited, not in the apartment, which we may now call the school-room, but in the chamber of Titus, on a massy oak desk or lectern, which turned upon its pedestal, and which they brought out from the patriarch's library for the purpose.

It was well that the school-room was rather remote, and had thick walls; for, missing his supper, the bear naturally became not only hungry, but savage, growled in the most ferocious manner, and rampaged about his cage like a fury. But he got nothing by it; and when he had drunk up the water, and exhausted his powers of growling and raging, he went to sleep. In the

morning, Titus brought him merely some fresh water and a cake of barley-bread; but in the afternoon, thinking it was now time for his pupil—who was tolerably tame after his unwonted exercise and fasting—to begin his studies, he brought with him the great book he had prepared for his use, and placed it open on the desk, which now stood before the horizontal opening between the bars already described. All the morning had been employed in preparing the desk and the book; and the former was now so contrived that, by means of a screw, the latter could be raised or lowered at pleasure. The book was no sooner placed before the opening, at the distance of a few inches, than the bear, which was on the look-out to see what was going forward, began to sniff and poke, and shewed a most eager desire to reach it. In fact, all along the lines of large letters, which were widely divided by the musical staves, the tutor, well knowing the taste of his pupil, had stuck little figs, dates, raisins, almonds, morsels of cake, comfits, and dried fruits; in short, all such little sweet things as bears so particularly delight in. The book was placed at such a height and distance, that the pupil could only reach the top line; and the eager manner in which he cleared it, gave promise that he would prove an apt scholar in that branch of learning. One page only was thus prepared for him; for at that period of his education it would have been impossible, without harsher measures than his tutor wished to adopt, to prevent him from cross-readings, which would greatly have blemished his scholarship. Some minor offences, such, for instance, as inordinate efforts to begin upon a second line before he had regularly perused the first, were punished by switching him on the nose, turning the double desk round—in which case it presented him with a mirror, that frightened him dreadfully—or even, in case of perverseness, leaving him to himself, without giving him the substantial honey-cake, which always rewarded a well-said lesson. In a short time the parties began to understand one another, and as Titus had prudently taken care to be known to his pupil only as a benefactor, he soon gained his confidence. The bear who, like all his race, had an ardent love for such dainties, found that he was welcome to eat all he could get, if he did but do it in a decent methodical manner. He soon learned, therefore, to take each line as it came; and, indeed, after a short time, his instructor not only ventured to cover the lines of the two open pages at the same time, but by enlarging the opening in front of his cell, he put it in his pupil's power to go on from one line to another without the book being raised; and after the tutor had for a week or two turned the leaf when necessary, the pupil began to shew that, if it was not done for him, he could do it for himself.

As the time drew on, the patriarch was most anxious to know, but did not venture to ask, how matters were going on. At length he summoned courage, and put the question, somewhat indirectly, to Titus; and although he received no particulars, yet he could not help feeling comforted by the cheerful manner in which his affectionate deacon assured him that everything was going on rightly, and that he need have no fear for the result.

In the meantime, the sultan, though less anxious, was intensely curious to see what would come of the matter, and frequently entered into conversation on the subject with his physician, who was, on somewhat different grounds, still more curious than himself. His sublime highness, however, who could not expect from a Jew much information respecting the secrets and mysteries of the Christians, rather confined the discourse between them to the physiological part of the subject, expressing his wonder—first, that bears should be able to learn to read; and, secondly, that such a capacity was not more frequently cultivated, asking him, withal, whether he had ever himself heard a bear read? The doctor, in parliamentary fashion, blinked

the question; observing that as it was done by secret practices, and no doubt for wicked purposes, it was best to say as little as possible about it. His sublime highness was not altogether satisfied, but comforted himself with thinking that time would soon throw light on the matter.

At length the day arrived when the bear's proficiency was to be put to the test. The sultan was seated on a divan in his hall of audience; his ministers and officers of state stood on either side; and behind him knelt his Jewish physician, who assumed that position, because, although he would not have failed, even at the hazard of his life, to be present, yet he had no strict right to be there; and, moreover, he did not particularly wish to be seen in the business. All were in breathless expectation when the Christian procession entered. The patriarch walked first, with his crosier in his hand; next came Titus, the tutor, bowed down under the huge lectionary, which he bore upon his back, secured by leathern straps over his shoulders; then followed Timothy, leading by a chain the carefully-muzzled pupil. This precaution was quite necessary; for, having been kept fasting four-and-twenty hours, the animal was in no good-humour, and would not have been so quietly brought in, if it had not been closely following the favourite book. But, in fact, the only trouble which Timothy had, was to prevent his eager charge from leaping at the volume while it was yet on his tutor's back. The procession was closed by a porter, bearing the desk, who, under the direction of Titus, placed it before the sultan, at such a distance as would conveniently enable the reader to stand between it and his sublime highness, who might thus see the book over his favourite's shoulder. Titus himself, thus relieved of his burden by its transfer to the desk, went round into the reader's place, and opened the ample leaves of the lectionary; while, to the great amusement of the sultan, Timothy was exerting his energies to the utmost to keep back the eager pupil.

'He seems fond of his book, however,' said the sultan; 'that looks well.' And all the circle bowed assent.

At length, having arranged the volume to his satisfaction, Titus received his pupil from the hands of his colleague. The bear stood up manfully to his task; but it need scarcely be said, he was sadly disappointed when he found that, unlike itself, the beloved book contained no sweets; not a morsel, though the often-travelled, much-licked, and still-beamsured lines retained the well-known scent and savour. He ran his nose over one line after another, all down the first page, then down the second, and then somewhat impatiently turned the leaf.

'Well,' cried the sultan, 'he certainly seems to take a great interest in it himself; and he may understand it perfectly, for aught I know; but I wish he would read aloud. I should like to hear him. Will you be so good as to tell him so?' he added, addressing the patriarch.

The venerable Mar Yusef was puzzled, and, as people often do when they are puzzled, he made a bow, but could think of nothing to say. Titus, however, promptly dropped on his knees between the bear and the sultan; and addressing the latter, he said: 'Your sublime highness will hear him presently; be pleased to give him a little time. Let him not be harshly judged, if he is a little timid and shy. This is his first attempt in public.'

As he said this, the deacon saw the twinkle of the Jew's eye over the sultan's shoulder. It was only for a moment, and nobody but Titus himself knew that he had seen it at all, so intently did he seem to be occupied in comforting and encouraging—perhaps we should say exciting, his pupil. The bear, however, being disappointed line after line, and page after page, and only stimulated and irritated by the scent and the slight taste which he could get by thrusting the tip of his tongue through his muzzle began to growl most

awfully, as he still went on mechanically, line after line, and turned the leaves with increased rapidity and vehemence. This continued for some time, until the pupil was evidently getting into a passion, and the tutor was growing rather nervous, when the sultan shewed a disposition to speak, which Titus most thankfully interpreted as an intimation that the experiment had been carried far enough. He instantly quieted his pupil, not so much by the order which he gave, as by shewing him a honey-cake, which nobody else saw, handed the chain to Timothy, and prepared to listen.

'As I observed before,' said the sultan, 'he certainly does seem to take a vast interest in it himself; and I daresay he understands it: but as to his elocution, I must say that it seems to me somewhat inarticulate.' The patriarch was puzzled again, and again he bowed, lower than before. The Jew chuckled, and whispered something in the sultan's ear. But Titus was not disconcerted. Falling again on his knees, he exclaimed: 'Pardon me, your sublime highness, we consider him a remarkably good reader, an animal of excellent parts, and a pupil who does us great credit. It is true, as your sublime highness's discrimination has observed, that his enunciation, even to those who know the language, may have some appearance of indistinctness, because he is defective in the vowel-points; but we cannot help it, for all our books are unpointed. In this, which, indeed, we consider a matter of little importance, we do not pretend to compete with the Jews, who teach theirs from pointed books. If your sublime highness ever heard a bear read more articulately than this one, it must have been one of theirs; and if you would have your own perfected in that particular, you must put it into their hands.' The sultan stared at the deacon; and the Jew eyed him over the sultan's shoulder with fierce alarm. But the hands of Titus were folded on his breast, and his head was bowed down on his hands.

'Well,' said the sultan to the patriarch, after a pause, during which it was obvious that some things were passing through his mind, of which he said nothing, 'I thank you for the pains you have taken; and although I cannot say that I quite understand the matter now, yet if I had known six weeks ago as much as I do at present, I would not have troubled you. If you are ever in want of any help or protection, remember, as I shall, that you have obliged me.'

The patriarch bowed. The sultan rose and retired, resolved that his first business should be to come to a full explanation with his doctor; and accordingly, a summons for the Israelite was instantly issued. Very long it seemed to the sultan—although, in fact, it was only half an hour—before the vizier came to report, that the doctor was nowhere to be found.

'Well,' said the sultan, 'I do not much wonder at that. I always thought him a wise man, and he is certainly no fool to get out of the way now. But, at the same time, let strict search be made; and also bring me the chief rabbi.'

In the confusion occasioned by the breaking up of the company, the tutor and his pupil—the latter of whom had naturally dropped into the less ostentatious posture of a quadruped—were forgotten, or at least overlooked, by the crowd of courtiers, who rushed to congratulate Mar Yusef, or laid their heads together, to whisper their surprise or their suspicions. Titus, therefore, having briefly given directions to Timothy to take care that the book was removed, and to see the patriarch home, and make an excuse for his staying behind, slipped with his amiable charge through a side-door into the garden, where he seated himself on a bench, while his companion stood opposite to him on his hind legs, looking wistfully, he almost thought reproachfully, in his face. In truth, Titus was conscious that he had tried the temper of his pupil, and was afraid to let him loose before company, or, indeed, to let him go into company at all, until he should have

brought him into good-humour. He had provided himself with ample means of doing this; and having produced more than one honey-cake, and several other good things, and laid them on the bench beside him, he did not hesitate to unmuzzle his friend, and a merry meal they made together.

If the master was rendered happy by the issue of an experiment which had been matter of such great and long anxiety, the pupil was also raised to a state of the highest possible good-humour, by being at once relieved from restraint and hunger. He looked cheerily about him; seemed as if for the first time he recognised his old haunts; gamboled through the now deserted hall and passages; and, before he had been missed by anybody, found his way, by a short cut, to his own rug in the sultan's apartment.

For a moment, indeed, while occupied in anticipating the explanation which he had resolved to extort from his doctor, the sultan, like his courtiers, had forgotten his favourite; but now the meeting was most cordial on both sides. The sultan seemed determined to make up for his neglect; and the favourite to shew, that neither scholarship, nor the discipline requisite for obtaining it, had diminished his social affections or companionable qualities.

At length the rabbi arrived. He had, indeed, been a little longer than was necessary on the way, because he had found some means of persuading the messenger to let him call on two or three friends as he came along. He did not lose much time by this, however; his only object being to ask them, to what extent they could help him in case the loan should be very large. Satisfied on this point, and preoccupied by the thoughts which had suggested the inquiry, he stood before the sultan. Great, therefore, was his surprise, when his sublime highness, instead of saying a word about money-matters, briefly, but clearly, explained to him the nature of the business in which his service was required.

'Your sublime highness is pleased to jest with your servant,' said the rabbi, as soon as he could command breath enough to utter the words.

'Not at all,' replied the sultan; 'you will find me quite in earnest, I assure you. He reads, and, I am told, reads as well as can be expected *without* the points; now you must teach him to read *with* them.'

The rabbi was utterly confounded. He could only bow down his head, wondering what the sultan could mean, and what he would say next, and whether it would throw any light on what he had said already. So his sublime highness continued, with some asperity: 'Do not think to deceive me. I know all about the matter. You can do it, and you had better not hesitate; for I am in no humour to be trifled with. I gave the Christians six weeks, and I'll give you the same. Don't answer, but go, and he shall be sent to you.'

The unhappy rabbi returned home in a state of bewilderment. He sent for some of his friends to consult with, most of whom were as much surprised as he had been, when they learned the nature of the business which had produced the summons. Only one of them, who happened to be a friend of the missing doctor, seemed to know anything about the matter; and he could not throw much light upon it. He could only tell them, for their comfort, that it was a very serious affair, and they must mind what they were about.

It would be only tiresome, if it were possible, to particularise all the suggestions and discussions which ensued. They were still going on when the bear arrived, and was duly installed in an apartment which had been prepared for him, as well as it could be on such short notice; for all agreed, that he must be treated with great care and attention, not only in order to propitiate him, but because it might be dangerous

to let him return in worse condition than he came. So neither trouble nor cost was spared to make him comfortable; and very comfortable he was: supplied with every luxury, crammed with dainties, and petted in every conceivable way. But whatever progress he might make in the study of mankind, and in other branches of useful knowledge, it was plain that he was making none in that particular branch of learning for which he had been sent to school. His instructors did not know how to deal with him. He was on easy terms with all about him, would play with anybody, and quarrelled with nobody; but learn he would not. When they held a book before him, he thrust his nose into the cream-bowl; when they spoke of Pathach and Segol, he shut one eye, and munched figs; and when, 'as a bird each fond endearment tries,' they set up a stave which might have made the very learned the Masorites to dance for joy, in the hope that instinctively, or by mere love of imitation, he might be led to join in the chorus, he only threw himself on his back, and fairly roared them down.

Sensible of all this, and of its probable consequences, the instructors had not been idle in another direction. They had used their utmost endeavours to learn how the pupil had been dealt with by his former tutor. But all their inquiries were fruitless. Titus had kept his secret so effectually, that even Timothy knew little, if anything, more than other people; or, in other words, more than had been transacted before the sultan and his court. But in collecting all such information as could be gleaned, they were indefatigable, and were scrupulously careful to imitate everything which had been done, not knowing what hidden virtue there might be in things apparently trivial. They provided a great book and a desk; and did, and were prepared to do, all that, so far as they could learn, had been done before. And so matters went on, until the time came for them to produce their pupil.

The sultan was led, by various considerations, to think that it would be better to have the examination rather more private than the former one had been; and, accordingly, at the time appointed, the rabbi and his companions were brought into his private apartment. They had no hope that the book and desk—which, however, they had taken care to provide—would be wanted by their pupil; and indeed for some time past their thoughts had been turned from any attempts at instruction, and employed in framing an apology, in doing which they flattered themselves that they had succeeded tolerably well.

The pupil, who had grown corpulent under his late course of treatment, did not at first raise his lazy, half-shut eyes high enough from the ground to see the desk and open book, which were clever imitations, if not quite facsimiles of forms deeply impressed on his memory, and calculated to produce very stimulating recollections. As soon as they caught his eye, he seemed to be seized with sudden passion, dashed at the book, and overthrew the whole concern. Fiercely did he thrust his nose and paws between the leaves, and turn them, and tear them, and trample them. At length, exhausted by his exertions—to say nothing of his having previously had more exercise than usual—he waddled away to his well-known rug, absolutely declined all invitations either to work or play, and lay there watching the company through his half-shut eyes, in a state of stupid repose, which those who had just watched his effervescence did not care to interrupt.

'Well,' said the sultan to the rabbi and his friends, 'you are a strange set of people. When I put my bear into your hands, he read fluently, and *con amore*; and all you had to do, was to perfect his articulation. Instead of that, you bring him back fat, stupid, and savage, and so far from reading better, unable to read at all. It would serve you right, if I were to hang the whole set of you, and confiscate all your goods;

but I am a merciful man, and will be content with banishment.'

So an order was immediately issued for banishing the Jews from the dominions of the sultan; and they all made off as fast as they could, not knowing that their own countryman had been at the bottom of all, or having any idea of the explanation which is here laid before the reader.

THE ZODIACAL LIGHT.

THERE is a certain degree of satisfaction to the inquiring mind in knowing that, even in these days of aptness for discovering and explaining everything, there yet remains something to be found out; something to excite speculation and recompense research. Such a subject is the zodiacal light, which, for nearly two centuries past, has at different times occupied the attention of astronomers and other observers of celestial phenomena, though it is only of late years that the theories concerning it have acquired anything like a precise character. Many ingenious hypotheses have been thrown out, which may perhaps be accepted as steps towards a true explanation; and while waiting the result of further inquiry, we shall endeavour to make our readers acquainted with the interesting phenomenon.

The zodiacal light is a peculiar brightness, pyramidal or wedge-like in form, seen at certain periods of the year in the eastern or western sky, before sunrise and after sunset. Its direction is in the line of the zodiac, whence its name—not perpendicular to the horizon, but at a varying angle, being in the spring from 60 to 70 degrees. The base of the wedge, which has a breadth generally of from 10 to 12 degrees, is below, and the sides rise in a line, curving outwards, to the apex, but so vague and diffuse as to be frequently indefinable. In our latitudes, it is best seen at or just after the equinoxes; before sunrise in autumn, and after sunset in spring; and becomes invisible as twilight increases, or if the moon shines; the light even of Venus and Jupiter is sufficient to render its discovery difficult. It is brightest at the base, and grows fainter the further it stretches from the horizon, vanishing entirely at the point. Unpractised observers would be apt to overlook it altogether, and those accustomed to watch the heavens are at times obliged to fix one eye on a dark space of sky, while they search for the light with the other, and discover it only by the contrast. A stratum of black cloud resting on the horizon often affords a means of detection, as the light can then be seen shooting from it with comparative distinctness. The soft, clear atmosphere which usually precedes or follows rain, is very favourable to a view of the light.

The luminous wedge varies in length with the progress of the seasons: sometimes but little more than its point is visible; at others, it is seen extending over a space of 120 degrees. Astronomically speaking, the axis of the zodiacal light is said to lie in the plane of the solar equator, with an angle of more than 7 degrees to the ecliptic, which it consequently intersects, the points of intersection becoming its nodes, and these nodes are the parts through which the earth passes in March and September. The light travels forward along the zodiacal signs from Gemini to Cancer and Leo from August to November, keeping pace with the sun. It grows dim towards the end of November, and fades more and more until January; but while this decrease has been going on in the east, and in the morning, the light has presented itself with increasing brightness in the west, and in the evening, and pursues its course until the end of February at about the same rate of motion. In March, it is slow, and travels through not more than one sign, and fades in April, and is lost in May, to reappear again at the end of summer, and perform the same route.

Lengthened twilight is not favourable to the appearance of the zodiacal light; it can, therefore, be observed

successfully in the temperate latitudes only by patient and long-continued watching. But in tropical regions, the deep azure of the sky, and the brief twilight, give it a distinctness and luminosity never witnessed elsewhere. In Egypt, we are told it is clearly 'visible every night, except when the light of the moon is too great, from January to June;' and in India its appearance is described as that of 'a pyramid of faint aurora-borealis like light' usually preceding the dawn. Humboldt tells us, that he has seen it shine with greater brightness than the Milky Way, from different parts of the coast of South America, and from places on the Andes more than 13,000 feet above the sea-level.

'Those who have dwelt long,' he writes, 'in the zone of palms, must retain a pleasing remembrance of the mild radiance of this phenomenon, which, rising pyramidally, illumines a portion of the unvarying length of the tropical nights.' And once, during a voyage from Lima to Mexico, he saw it in greater magnificence than ever before. 'Long narrow clouds, scattered over the lovely azure of the sky, appeared low down in the horizon, as if in front of a golden curtain, while bright varied tints played from time to time on the higher clouds: it seemed a second sunset. Towards that side of the heavens, the light diffused appeared almost to equal that of the moon in her first quarter.'

The zodiacal light can hardly fail of having been observed by astronomers in the past ages of the world; but the earliest known mention of it occurs in the *Britannia Baconica*, published by Childrey in 1661. The writer says: 'There is another thing which I recommend to the observation of mathematical men—which is, that in February, and for a little before and a little after that month—as I have observed for several years together—about six in the evening, when the twilight hath almost deserted the horizon, you shall see a plainly discernible way of the twilight, striking up towards the Pleiads, and seeming almost to touch them. It is so observed any clear night, but it is best *illæ nocte*. There is no such way to be observed at any other time of the year. But what the cause of it in nature should be, I cannot yet imagine, but leave it to further inquiry.' The further inquiry followed soon afterwards, for Cassini, the eminent French astronomer, having carefully observed the phenomenon from 1683 to 1688, communicated the results to the Académie des Sciences. Some of his views and determinations were well founded; and from them we gather that the zodiacal light was nearly or quite the same in his day as at present. Others also devoted considerable attention to it, and noticed the variations in brightness in different years, which subsequent observations have verified. Since then, it has been made more or less a subject of investigation by modern astronomers, and has been observed in many parts of the world; the first observations in the southern hemisphere being those made by Professor Smyth at the Cape of Good Hope, from 1843 to 1845. In that latitude, the zodiacal light is best seen in spring evenings, at an angle of 30 degrees, visible long after sunset; its opposite peak is discernible at daybreak, but has scarcely come into view before the rising sun overpowers it. In autumn, the reverse takes place; the best appearance is in the morning.

To understand what is meant by the 'opposite peak,' we are to regard the zodiacal light, of which we see only one end in our latitudes, as a body extending all round the sun in the same form, presenting at a distance the appearance of one of those flat elongated oval nebulae seen in the heavens. Its direction is at right angles to that of the sun's rotation, a straight line drawn from either pole of the great luminary divides it in the centre. From its outline resembling that of a lens in section, it is frequently described as a 'cosmical body of lenticular form.'

From this account of what the zodiacal light appears to be, we proceed to consider what it is. Some inquirers

—arguing from the 'nebular theory,' which assumes the formation of the several planets, one after another, from nebulous matter—have supposed the zodiacal light to be a remnant of that matter yet unconcentrated. In this view, it may be a nebula, brightest in the centre, as is the case with most, and fainter towards the margin. According to Humboldt, 'we may with great probability attribute the zodiacal light to the existence of an extremely oblate ring of nebulous matter, revolving freely in space between the orbits of Venus and Mars.' On several occasions he witnessed its fluctuations, night after night, from the plains of South America, shewing itself at times greatly collapsed or condensed, with intermittences of vividness and faintness, in the course of a few minutes, as is observed of the aurora. The light of the stars, of even the fifth or sixth magnitudes, can be seen through it: the same has been remarked of comets; and it is known also that the tails of comets undergo frequent flashings or pulsations, so that the two phenomena may be analogous in character. It is necessary, however, to distinguish the fluctuations from such effects as may be produced by movements in the lower strata of the atmosphere.

Mairan, who wrote in 1781, was of opinion that the zodiacal light consisted of particles thrown off from the sun by its rapid rotation, or a species of atmosphere peculiar to the central orb. Others have supposed the luminosity to be composed of 'revolving planetary particles,' shining by a direct or reflected light. But, according to Professor Olmsted, of Yale College, Massachusetts, it is something which has a motion of its own around the sun, notwithstanding that the general steadiness of its movements had warranted the notion that it was in some way attached to the body of the sun itself. Olmsted's conclusions are drawn from a diligent observation of the light during a period of six years, and are on this account, as well as from his scientific reputation, entitled to respect. He states the light to be, in constitution, colour, and density, similar to that of the tail of a comet, the portion nearest the sun being brightest, and both admitting of stars being seen through them. We may, therefore, infer it to be a nebulous ring surrounding the sun, in the same way that the magnificent rings of Saturn surround that planet. Of such nebulae as this there are from 2000 to 3000 visible in the regions of space, compared with which the dimension of ours is insignificant: at the same distance, and sought for with the same instruments, it would be invisible.

In one point, Professor Olmsted's views are particularly interesting, as, out of one mysterious phenomenon, he endeavours to explain another, and inquires: 'Whether or not the zodiacal light is the origin of the meteoric showers of November and August, and especially those of November?' Many readers know that for some years past great numbers of falling-stars, or showers of meteors, have been observed periodically in November: the fall seen in the United States in 1834—when, as is estimated, more than 240,000 stars fell as thick as snow-flakes, in the space of nine hours—being the most remarkable hitherto known. The explanation is, that the zodiacal light is a nebulous body revolving round the sun, and arrives at its aphelion on the 15th November in that part of the earth's orbit which the earth then reaches, and, coming into contact with our atmosphere, portions of the nebulous matter are detached, and, taking fire as they pass through, appear to us as shooting-stars. This explanation of the phenomenon in question is one not hastily conceived; the reasoning on which it is founded is altogether satisfactory, as well with regard to the movement of the nebulous matter, as to that of the earth.

Professor Olmsted, in a communication addressed to the 'American Association for the Advancement of Science,' sums up his views as follows:

'1. The zodiacal light, as we have found, in our

inquiry into its nature and constitution, is a *nebulous body*.

'2. It has a revolution round the sun.

'3. It reaches beyond and *lies over the earth's orbit* at the time of the November meteors, and makes but a small angle with the ecliptic.

'4. Like the nebulous body, its periodic time is commensurable with that of the earth, so as to perform a certain whole number of revolutions while the earth performs one, and thus to complete the cycle in one year, at the end of which the zodiacal light and the earth return to the same relative position in space. This necessarily follows from the fact, that at the same season of the year it occupies the same position one year with another, and the same now as when Cassini made his observations nearly 170 years ago.

'5. In the meteoric showers of November, the *meteors are actually seen to come from the extreme portions of the zodiacal light*, or rather a little beyond the visible portions.'

There is much that is suggestive in this summary, and, as we said at the commencement, the subject is one of a nature to stimulate inquiry and research, and to lead to further explanations of cosmical phenomena. M. Mathieson's observations, published in the *Comptes Rendus* of the Académie des Sciences for 1843, shew, that when tested with the thermo-multiplier, the zodiacal light was found to radiate heat as well as light—a fact which, if further verified, will support the evidence in favour of an independent luminous ring.

WHO WROTE SHAKSPEARE?

Thus asks Mrs Kitty in *High Life Below Stairs*, to which his Grace my Lord Duke gravely replies: 'Ben Jonson.' 'O no,' quoth my Lady Bab: 'Shakspeare was written by one Mr Finis, for I saw his name at the end of the book!' and this passes off as an excellent joke, and never fails to elicit the applause of the audience; but still the question remains unanswered: Who wrote Shakspeare? a question, we humbly think, which might be made the theme for as much critical sagacity, pertinacity, and pugnacity, as the almost equally interesting question, who wrote Homer? In the former case, the question is certainly in one respect more simple, for the recognised plays and poems that go by Shakspeare's name are—at least by far the larger portion—unquestionably from one and the same pen; while Homer, poor, dear, awful, august, much-abused shade! has been torn by a pack of German wolves into fragments, which it puzzles the lore and research of Grote and Muir to patch together again. Even Mr Grote seems disposed to admit, that while the *Odyssey* may pass muster as one continuous poem, whatever was the name of the author, the greater *Iliad* must be broken up at least into an *Iliad* and an *Achilleid*, by different rhapsodists; and though Colonel Muir stands stoutly on the other side, the restoration of the unity of Homer may, even with us sober-minded thinkers, take ten times the years it took to capture Troy; while with the German Mystics and Mythists, the controversy may last till they have to open their bewildered and bewildering eyes upon the realities of another world.

So far, therefore, the question is limited, for we are entitled to assume, what no one at this time of day dreams of disputing, that *Hamlet* and his fellows are not only the productions of one mind, but are beyond comparison the greatest productions which man's intellect, not divinely inspired, has yet achieved. The question therefore is—who wrote them? With the exception of Homer, who lived before the time of written history, and Junius, who purposely and successfully shrouded himself in obscurity, there has, perhaps, been no great writer who has not in his life, his letters, or his

sayings, more or less identified himself with the productions of his pen. Take Walter Scott, for instance; or Byron, or Addison, or Dryden; or, to go still earlier, take Ben Jonson, or Kit Marlowe, or Geoffrey Chaucer, and each and all of them have external marks by which we could assign the authorship, even if the production had been published anonymously. Try Shakspeare's plays by the same test, and suppose *Hamlet*, *Macbeth*, &c., had been successively published after the fashion of Junius, and what critic of any age would ever have ascribed them to William Shakspeare?

This may appear uncandid and unfair. It may be said, that Shakspeare lived in a time when letter-writing and letter-preserving were comparatively infrequent, and that we have no right to deprive him of his authorship, any more than we should have had to deprive Dr Johnson of *Rasselas*, if he had not had the good-fortune of a Boswell to record his sayings. So we humbly think it would, had Shakspeare, like Homer, been wholly unknown, and every record of him lost; we should then, as in the case of Homer, have judged exclusively from the internal evidence of the works themselves, and formed a brilliant ideal picture of what the astonishing author must have been in his daily walk, correspondence, and conversation. But, unfortunately, enthusiasm worked up to its pitch, sweeping the clouds for a bird's-eye view of the high pinnacle of human greatness commensurate with the 'local habitation and the name' of such a genius, is at once 'cabined, cribbed, confined,' by the authentic recorded whatabouts, whenabouts, and whereabouts of William Shakspeare, actor, owner, purchaser, and chattels and message desivor whilom of the Globe Theatre, Surrey-side; item of the Blackfriars, Fleet Street; and ultimately of Stratford-on-Avon, 'gent,' husband of Anne Hathaway, to whom he devotes his second-best bed. On the one hand, research has traced his life from the cradle to the grave, and by means of tradition, legal documents, records, and inscriptions, formed a very accurate skeleton biography; while, on the other hand, with the single exception of Ben Jonson, to be noticed hereafter, records and even tradition are silent upon his walk and conversation; and though his signature has been several times disinterred, his whole correspondence, if he ever wrote a letter, has sunk like lead beneath the dark waters of oblivion; indeed, even the single signature as yet discovered unconnected with business documents—namely, the 'Willm^e Shakspeare' on the volume of Montaigne—is not preceded by any remark whatever, by any sentence that might give a faint echo of *Hamlet*. Now this, to say the least, is singular to the very last degree. The unsurpassed brilliancy of the writer throws not one single spark to make noticeable the quiet uniform mediocrity of the man. Is it more difficult to suppose that Shakspeare was not the author of the poetry ascribed to him, than to account for the fact, that there is nothing in the recorded or traditional life of Shakspeare which in any way connects the poet with the man? It will not do to use the common hackneyed expression, that Shakspeare had a 'genius so essentially dramatic, that all other writers the world has seen have never approached him in his power of going out of himself.' Even the inspired writers of Scripture have their style and their expressions modified, and adapted to the peculiar idiosyncrasy and accidental position of the respective men; and taking human nature as we find it, we think it much easier to suppose that Shakspeare never once appears personally in his dramas, because his interest in them was not personal, but pecuniary. William Shakspeare, the man, was comparatively well known. He was born in Stratford-on-Avon, of respectable parentage; he married Anne Hathaway; had children; apparently became unsettled; went to London to push his fortune; made a deal of money by theatrical speculations,

and by the profits of certain plays, of which he was reputed to be the author; then retired quietly to the country, and was heard of no more, excepting that a few years afterwards old Aubrey states that 'Shakespeare, Drayton, and Ben Jonson had a merry-meeting, and, it seems, drank too hard, for Shakespeare died of a fever there contracted.' Brandish not thy dagger, Melpomene, at this profanation! The scandal is not ours, but Aubrey's, Shakespeare's earliest biographer, but who did not write till forty-six years after his death. His name and signature are connected with the buying and selling of land and theatrical shares, and such-like commonplace transactions; and his last will and testament, with which everybody is familiar, is as plain and prosaic as if it had been the production of a pig-headed prerogative lawyer. Now, in all this we see a sensible, sagacious, cautious, persevering man, who certainly was free from the rashness and (excepting the closing scene, if old Aubrey is to be believed) rakish extravagance too often characteristic of genius at any time, and perhaps particularly so of Shakespeare's time. It is apparent that Shakespeare, at least from the time the plays commenced, never had to shift for his living: he had always money to lend and money to spend; and we know also, that many of his contemporaries, men with genius akin to that which produced these plays, were in continued and utter extremity, willing to barter exertion, name, and fame, for the daily dole that gets the daily dinner.

May not William Shakespeare—the cautious, calculating man, careless of fame, and intent only on money-making—have found, in some furthest garret overlooking the 'silent highway' of the Thames, some pale, wasted student, with a brow as ample and lofty as his own, who had written the *Wars of the Roses*, and who, with eyes of genius gleaming through despair, was about, like Chatterton, to spend his last copper coin upon some cheap and speedy means of death? What was to hinder William Shakespeare from reading, appreciating, and purchasing these dramas, and thereafter keeping his poet, as Mrs Packwood did? The mere circumstance of his assuming them as his own, may have seemed to be justified by his position as manager, and his regard to the interests of the theatre; as a play by a well-known and respected favourite would be more likely to escape hissing than one by an unknown adventurer; and the practice once commenced must go on; for we cannot suppose that Shakespeare could afford to deny the authorship of *Macbeth*, if he had previously consented to father *Henry VI.*, *The Two Gentlemen of Verona*, and the *Midsommer Night's Dream*. This assumption, we are sorry to say, smooths away many of the difficulties that have hitherto baffled the critics. How could Shakespeare, say they, have been able to write at all, while obviously and laboriously employed in the active business of his profession? Where did he acquire that all-comprehensive knowledge of nature, men, and books? How could he paint with such exact fidelity the peculiar scenery pertaining exclusively to the subject in question, when he can be proved never to have left London? What time had he to tread the 'blasted heath,' or describe the aspect of Glamis Castle? How could he accomplish all this? Why, simply, and naturally, and easily—by affording his poet all the requisite leisure, and defraying the expenses of all the requisite tours. And with this view, though it cannot be proved, and is very unlikely, that Shakespeare ever was in Scotland, yet it is most likely that the author of *Macbeth* was; and thus the intelligence, but not the genius, of these wonderful works ceases to be supernatural. Again, not one single manuscript of Shakespeare's plays or poems has ever been discovered; and certainly the search has been as rigorous and continuous as that for the Philosopher's Stone; while even Scott, when owing to the Novels, found it necessary to say that almost all the manuscripts were

holograph; nor, if we do not very much mistake, is there among all the records and traditions which have been handed to us, any statement of Shakespeare having been seen writing, or having delivered his manuscript.

Of course, the obvious answer to all this is, that such a transaction, carried on through so many years, and having reference to works which even in that age excited considerable admiration and attention, could not be concealed. We may reply to this, that Shakespeare, who apparently was liked by every one, did not conceal it from his friends, and that they supported him in this pardonable assumption—the members of the theatre for their own sakes, and his other friends for his.

Take, besides, the custom of the age, the helter-skelter way in which dramas were got up, sometimes by half-a-dozen authors at once, of whom one occasionally monopolised the fame; and the unscrupulous manner in which booksellers appropriated any popular name of the day, and affixed it to their publications; and who so popular with all playgoers of the period as the gentle, well-living Shakespeare? And his name would better suit his friends and the then public, than any mere recluse, unknown poet, until his name, like other myths, acquired sanctity by age. Indeed, we fear it is not necessary to go back to Shakespeare's time to find the practice of assumed authorship of purchased plays, without either the reasons or the excuses which apply to Shakespeare. Unfortunately, however, for those who claim Shakespeare for Shakespeare, the secret was not wholly kept. Robert Greene, a well-known contemporary, a writer of reputation, but one who led the skeldering life peculiar to most of his class, addressed, on his death-bed, in 1592, a warning to his co-mates not to trust to the puppets 'that speak from our mouths.' He then goes on in these remarkable words, which we believe every critic thinks were intended for Shakespeare: 'Yes, trust them not; for there is an upstart crow beautified with our feathers, that, with his tiger's heart wrapt in a player's hide, supposes he is as well able to bombast out a blank verse as the best of you; and, being an absolute *Johannes Factotum*, is in his own conceit the only *Shake-scene* in a country.' Again: with this view, the disputed passages—those in which critics have agreed that the genius is found wanting—the meretricious ornaments sometimes crowded in—the occasional bad taste displayed—in short, all the imperfections discernible and disputable in these mighty dramas, are reconcilable with their being the interpolations of Shakespeare himself on his poet's works.

The dedication of the *Venus* and the *Lucrece* to Lord Southampton is, we confess, somewhat against us, for we cannot but think these poems came from the pen that wrote *Romeo*; but, after all, Southampton was so generous a patron, that Shakespeare might be excused in assuming the authorship, in order to make the books (as his poems) a better return for the thousand pounds bestowed. But if Southampton really knew him to be the author of the dramas, how comes it that Raleigh, Spenser, and even Bacon—all with genius so thoroughly kindred to the author of *Hamlet*—have all ignored his acquaintance? Raleigh and Bacon seem not to have known of his existence; while Spenser, if he alludes to the works, takes care to avoid the name. In short, Heywood, Suckling, Hales, and all the others who are recorded to have spoken of Shakespeare 'with great admiration,' confine themselves to the works, and seem personally to avoid the man—always excepting '*Rare Ben Jonson*;' and we confess, if Ben is to be entirely believed, Shakespeare wrote Shakespeare. But Ben, if unsupported, is somewhat disqualified from being what the Scotch would call a 'famous witness'—he was under the deepest pecuniary obligations to Shakespeare, and was through life, despite the nonsensical tradition of their quarrel, his hearty friend.

and boon-companion, with 'blind affection,' as he phrases it, as seen above, literally 'unto death,' and therefore bound by the strongest ties to keep his secret, if secret there were. Besides, Ben can be convicted of at least one unqualified fib on the subject. Hear how he describes Droeshout's print of Shakspeare, prefixed to the first folio edition of 1623:

This figure that thou here see'st put,
It was for gentle Shakspeare cut,
Wherein the graver had a strife
With nature to outdo the life.
Oh! could he have but drawn his wit
As well in brass, as he hath lit
His face, &c.

Hear now Nathan Drake: 'The wretched engraving thus undeservedly eulogised;' and Mr Steevens calls it 'Shakspeare's countenance deformed by Droeshout'—like the sign of Sir Roger turned into the Saracen's Head.

We might, did space allow, also allude to the celebrated 'wit-combat at the Mermaid,' where Shakspeare's wit, when recorded, becomes truly un-Shakspearian. Let one example suffice, stated by Capell. 'Ben' and 'Bill' propose a joint epitaph. Ben begins:

'Here lies Ben Jonson,
Who was once one—'

Shakspeare concludes:

'That, while he lived, was a *slow* thing;
And now, being dead, is *no*-thing.'

We doubt if Benedict would have gained Beatrice had he wooed her in this style, and yet its tiny sparkle seems a beam of light contrasted with the dull darkness of the rest. In fine, we maintain we have no more direct evidence to shew that Shakspeare wrote Hamlet's soliloquy, than we have that he wrote the epitaph on John a Coombe, the ballad on Sir Thomas Lucy, or the epitaph to spare his 'bones' on his own tombstone—all of which the commentators are now determined to repudiate.

Assuming, then, that we have proved, to our own extreme dissatisfaction, the probability that Shakspeare kept a poet, we are bound to say that the intercourse between them must have been one of almost unexampled cordiality and kindness; for seldom can we discover anything like hostility in the poet to his employer; but there must have been two little misfits—one of which occurred during the writing of the *Midsummer Night's Dream*, and the other before the publication of the *Twelfth Night*. Shakspeare, it is well known, in very early youth, married a girl a good deal older than himself, and there is at least no evidence to shew that, as usual, he did not repent his choice. Now, we will admit that it was unhandsome in the poet at the beginning of the *Dream* to make Hermia and Lysander discourse upon this delicate subject—

Hermia. O cross! too high to be enthralled to low!

Lysander. Or else misgraffed in respect of years.

Her. (the lady.) O spite! too old to be engaged to young!

But matters were still worse, when the Duke, in the *Twelfth Night*, exclaims:

'Too old, by Heaven! Let still the woman take
An elder than herself.'

And again:

'Then let thy love be younger than thyself,
Or thy affection cannot hold the bent;
For women are as roses, whose fair flower
Being once displayed, doth fall that very hour.'

It is, we confess, very difficult to suppose that Shakspeare, with his unquestionable good feeling, could have written this unhandsome insult to his own wife, though it is very easy to imagine his passing it over in a hurried perusal previous to its presentation in the green-room.

One thing at least appears certain, and not disputed—the plays apparently rise, if we may use the expression, as the series goes on; all at once, Shakspeare, with a fortune, leaves London, and the supply ceases. Is this compatible with such a genius thus culminating, on any other supposition than the death of the poet and the survival of the employer?

Well, reader, how like you our hypothesis? We confess we do not like it ourselves; but we humbly think it is at least as plausible as most of what is contained in the many bulky volumes written to connect the man, William Shakspeare, with the poet of *Hamlet*. We repeat, there is nothing recorded in his everyday life that connects the two, except the simple fact of his selling the poems and realising the proceeds, and their being afterwards published with his name attached; and the statements of Ben Jonson, which, however, are quite compatible with his being in the secret. In fact, the only other hypothesis which we think will serve at all, is to suppose that Shakspeare, like Mohammed, instead of going to a garret, went to a cave, and received his *Koran* from Gabriel; but then the mischief is, that Shakspeare is the most readable of authors, and the *Koran*, perhaps the most unreadable trash ever inflicted on a student—at least its translation is; and besides, no angel of them all could ever have shewn such an acquaintance with our (to a celestial) unkindred humanity as these poems display. Perhaps the best and crowning hypothesis is that of Byron about Junius:

That what we Shakspeare call,
Was really, truly, nobody at all.

Thus, whether Shakspeare were written by nobody or not, it seems pretty well proved that *nobody* gave the plays to Shakspeare; so that, whether by inheritance, purchase, or divine afflatus, the man who wrote Shakspeare was—William Shakspeare.

A NIGHT ON THE MOUNTAINS OF JAMAICA.

For persons who have never visited the tropics to form an idea of the exceeding beauty of night in these regions, is utterly impossible. The azure depth of the sky, illuminated by numberless stars of wondrous brilliancy, seems, as it were, reflected in the giant foliage of the trees, and on the dewy herbage of the mountain-sides, gemmed with the scintillations of innumerable fire-flies; while the gentle night-wind, rustling through the lofty plantain and feathery cocoa-nut, bears upon its breath a world of rich and balmy odours. Perhaps the scene is still more lovely when the pale moon flings down her rays on the chalice of the *Datura arborea*, brimming with nectareous dew—her own most favoured flower, delicate of scent and chaste in beauty. Yet the night of the tropics has many drawbacks: noxious, unsightly creatures then forsake their lair, lithe snakes uncoil their glossy rings, bats flutter in the moonbeams, and croaking frogs disturb the silence of the hour.

In a valley of the St Andrew Mountains, in the island of Jamaica, where we resided for a short time, we beheld in perfection this lovely night, and experienced in an equally great degree its inconveniences. It was indeed a favoured spot, for which nature had done her utmost. Sublime and beautiful were there so exquisitely blended, that to determine the leading characteristic of the scenery was impossible. Mountains, clad to the loftiest summit in perpetual verdure; gigantic trees, rich in blushing fruits; pensile plants, aglow with the choicest flowers; proud-rifted rocks, pale and ghastly, as if cleft by an earthquake; foaming cascades springing madly down the cliffs, leaping through chasms spanned with aquatic creepers, and then dwindling into ever-gurgling streams, that glided through ravines curtained with verdant drapery—such

were some of the details of the picture; but how vain the endeavour to describe this redundant beauty! A friend, who enjoyed it with a zest as keen as our own, once remarked: 'It is like nothing in this world but one of Salvador Rosa's pictures framed in a garland of flowers!'

This gorgeous scenery screened from our dwelling the unsightly squalor of a negro village, which lay at a distance of a mile and a half on the other side of an abrupt hill to our rear. It consisted merely of some score of huts, of miserable aspect, formed of matting, stretched on stakes stuck in the ground; and in other cases, of interwoven bamboos, dabbled with mud, and roofed over with gigantic palm-leaves. Each had its garden in front, of yams, cocos, and sweet potatoes. The negroes of the village were our nearest neighbours, and we visited them occasionally, in the hope of ameliorating their condition by communicating to them such instruction as they were capable of receiving; but their grotesque ideas of liberty, overweening egotism, and marvellous superstition, together with the shortness of our stay in their vicinity, combined to frustrate our object.

The place we occupied had been once a missionary station, and consisted merely of a couple of chambers, a sitting-room, and a veranda that ran round the house, which was built of an inferior species of mahogany, and ceiled and floored with the same. The colour of the wood, together with the fact, that all the former occupants had fallen victims to the climate, gave the house an air of extraordinary gloom; still, this was in some measure dissipated by the multitude of flowers in the garden, of the kinds familiar to us in England, and which, from the equable temperature of the mountain climate, flourished in the open air.

Before the windows flashed a bright parterre, begirt with a thick hedge of salvias, above which the exquisite humming-bird for ever hovered. The hedge was intermingled with the tea-rose, white jasmine, fuchsia, pink cactus, and bignonia; all of which, from the hardihood of their growth, appeared indigenous. Balsams sprang like weeds, and every conceivable variety of convolvulus flaunted in gay bands from the shafts of ever-blossoming limes. Along the veranda, extending from column to column, ran a drapery of nurandias, lobes, and plumbago; while at the end of the parterre, in close proximity, stretched the grave-yard of the station, studded thick with white stones, recording the names of many a once weary missionary and Christianised negro.

About a month after our arrival at Rosevale—for so was the place called—my husband was compelled by professional duty to be absent for a couple of days. It was the first time I had ever been left alone, having been only recently married, and separated from my family in England. An utter stranger in the island, my nerves were somewhat subdued at the prospect before me; and although determined to endure the loneliness very bravely, still it was not felt the less acutely. There were no Europeans nearer than a distance of five miles; and owing to the peculiar nature of the scenery, its extraordinary stillness, and the unusual aspect of its gigantic vegetation, it was, despite its beauty, invested to a remarkable degree with an air of desolateness and solitude. At five in the morning, my husband set out upon his journey, and at eight a negro came to inquire whether massa was at home. This was an unusual circumstance; but upon hearing that massa left home that morning, he departed, and I thought no more of him. The weary day dragged heavily to a close, and at eight in the evening the same negro returned, and repeated his inquiry by the light of a lamp held by a young lad of his own race in our service. I saw the man's face, and suffering, perhaps, from nervous irritability, fancied I had never seen a countenance more sinister. My pulse throbbed quickly, as the reply was given, that

'Massa wouldn't return till the night of the ensuing day.' Here was an admission! I alone in this wild, outlandish place, attended only by my maid, a semi-German, semi-Irish girl, exceedingly timid, and a couple of negro servants, if possible more cowardly: I felt my heart sink, as after uttering some half-intelligible words, the sable visitor departed. While drinking tea in solitude, musing on the old familiar faces of my former home, never was the croaking of the frog so loud, the curlo's note so shrill, the evening air so gentle. I heard the negro servants without expressing their astonishment that, now as massa was gone, missus wouldn't call in Miss Jane (the maid), and make her 'peak' to her; adding—'Rosevale not good house to lib by himself in—plenty "padres" die dere, plenty doppies (ghosts) come up dere from de grave-yard! Now my dread was not of the 'doppies,' but I did fear the return of the recent ill-favoured visitor.

Our books had not yet been forwarded from Kingston, so I had not the solace of a favourite author; but on a shelf in the sitting-room lay an odd volume of Missionary Reports, and the third or fourth of Mandeville's English History, which had belonged to the former occupant of the place. These I took from their resting-place, and essayed to read, when, in an instant, a bat dropped from the rafters, and fluttering round and round the lamp, cut short my studies. Formerly, church-service was wont to be celebrated in this same room; and for the purpose of kindling, by means of music, any latent sparks of devotion in the minds of his sable flock, the deceased clergyman, who had resided before us at Rosevale, had imported a seraphine, which he played with skill, and which had never been opened since his death. It stood as he had last touched it, at one end of the sitting-room; and hoping to overcome my nervousness, I strove against the feelings which had hitherto withheld me from approaching the instrument. I seated myself before it, and began a sacred melody, when, by the imperfect light, it seemed as if the keys were in motion. This I at first attributed to the manner in which the light was thrown, owing to the wheeling flight of some four or five bats that had joined the earliest intruder in his frolics. This idea, however, was speedily dissipated by a great cockroach crawling upon my fingers, and I started up with a shudder, for the instrument was literally covered with these unsightly creatures. I then paced up and down the veranda, flooded with moonlight, till a short time past ten o'clock, when the moon set, and I retired for the night to my chamber, where my uneasiness was speedily overcome by sleep.

At midnight, or probably earlier, I awoke with a start: unusual sounds were on the air; and the sinister visage of the past evening's visitor presented itself to my disturbed imagination. I stilled my heart, and listened. The sounds seemed to come from the negro village. I sprang from my bed, and, approaching the window, unclosed the jalousie, and saw a number of negroes pouring down the mountain-side—some bearing large torches, and all yelling fearfully. On streamed the living mass; closer and closer they approached, till their faces were distinctly visible. They carried with them a hideous burden—a swathed and ghastly corpse, the rigid features of which looked ghastlier still in the lurid glare of the torch-light! This they flung, with frantic gestures, from one to another, receiving it in their arms with a yell and a scream, gibbering in fiendish glee, and dancing and whirling about. Sickening at the horrid sight, I turned away, and closed the jalousie; when, as the procession surrounded the house, my maid rushed into the room, exclaiming: 'O ma'am, what will become of us? they are trying to force the doors—they are coming in!'

For some time they continued seeking an entrance; but the thought of admitting them never once crossed my imagination. At last, one among the number

suggested the inutility of any further attempt; and, abandoning their original design, they all marched off to the grave-yard, where they remained till dawn as it seemed in some grand carousal. They then, as I was afterwards told, returned to the dwelling of the deceased, laid him in his coffin, and at six in the morning bore him to his last resting-place. This ceremonial was called 'The Feast of the Dead,' and was celebrated in order to insure a favourable reception for their departed brother from the mouldering occupants of the grave-yard, and to prevent the appearance of his doppelgänger.

The deceased, it seems, had been a carpenter, and in that capacity had worked occasionally at Rosevale, which, a few days previously to our arrival, had been the scene of his last labours. It was thought necessary, therefore, for the repose of his soul, that, prior to interment, his body should be brought into the house to pay a farewell visit.

A fellow-passenger in our voyage to Kingston related to us a similar occurrence. He had been but a short time resident at Montego Bay, and was, with his wife, active in disseminating Christian knowledge among the negroes of the district. One family, more intelligent than the rest, particularly attracted this good lady, who was much interested in their behalf, in return for which, they attached themselves to her most zealously. Their eldest child, a young girl of fourteen years old, was attacked by a malady, which suddenly terminated in death; and Mrs R— was ignorant of the fact, till one evening, as she was entertaining company, the corpse of the poor girl, dressed in the latest gifts she had bestowed, was borne into the midst of the party, to take leave of the kind benefactress, so beloved by her in life.

The dread in which the appearance of disembodied spirits is held by the negroes is excessive, and the expedients to which they resort to defend themselves from their intrusion are truly absurd. One of these is to drive ten nails into the door in a pentagonal form—a very effectual barrier; for the doppelgänger, on beholding it, can neither advance nor recede, but remains there literally spell-bound till the witching-time of night is past, vainly endeavouring to reckon the number of nails, but unable to get beyond the fifth. Another very excellent preventive, in negro estimation, is old leather—that which has been worn in boots or shoes is considered best. This should be burned with horse-litter, and afterwards rubbed upon the door-posts. 'This,' to quote one of the dusky fraternity, 'make such a bad mell, that it catch him nose; and de berry Jurabie himself would run away from it!' I know not the extent of Satanic endurance, but for a mere mortal to bear with it is impossible, as I once found by experience, when it compelled me to take refuge in the bush.

NATIONAL PROSPERITY AND INDIVIDUAL PANIC.

THE *London Gazette* of the 3d July 1852, announced, in its weekly report of the Bank of England, that the gold coin and bullion in the issue department had reached the sum of £21,742,110. It had never reached such a sum before. But this is not all. While this vast amount of gold already lies in the vaults of the Bank, nearly every ship from Australia, and steamer from America, brings more of the precious metal.

There are not wanting persons to whom this accession of treasure to the country is a subject of panic. The annuitant dreads a depreciation of the value of gold, equivalent, of course, to a general rise in the price of those commodities which conduce to his comfort; or, in other words, to a diminution of his income. The millionaire sees rivals springing up on all sides from the mountain of gold. Many in every class, who are at

ease in their circumstances, and would fain have things remain as they are, look with dislike on a state of things so new, and wish that the 'diggings' in California, and the gold region of Australia, had never been disturbed by spade or pickaxe.

If gold were not our standard of value, no such panic could exist in any mind; but, on the contrary, the abundance of a metal so pre-eminent in beauty and utility must be universally hailed as a boon. Silver is now the legal tender in most countries of Europe, and used to be so in England, till it became too abundant; but where transactions are large, silver is too cumbersome: a man can carry £500 in gold in his pocket, but £500 in silver would require a horse.

The reason why these two metals form the money of the most civilised nations, need not be gone into here at any length. 'Their qualities of utility, beauty, and scarcity,' says Adam Smith, 'are the original foundation of the high price of those metals, or of the great quantity of other goods for which they can everywhere be exchanged. This value was antecedent to, and independent of, their being employed as coin, and was the quality which fitted them for that employment.'

We have printed the word *scarcity* in italics, because that is the point of alarm. 'If,' say the alarmists, 'gold, which has been in all the world's annals scarce, is to become plentiful, one of the conditions of its fitness for coin is annihilated.' To this we reply: Scarcity is a relative term. Actual scarcity of a commodity may exist, to all practical purposes, in the midst of an abundance of that commodity; because scarcity is occasioned by two very different causes—namely, limited supply and excessive demand.

An amount of gold coin which would be very large for a small community, might be very insignificant for the use of a great and populous nation. In August 1789, the bullion in the Bank of England amounted only to £8,645,860; but we think that was a larger sum for the Bank to possess, in relation to the population and trade of England at that period, than £22,000,000 now.

In 1801, the population of Great Britain numbered about from ten to eleven millions; in 1851, nearly twenty millions. Whatever quantity of money, therefore, was necessary for the former period, a very much larger, perhaps a double quantity—supposing an equal degree of prosperity to exist—would be requisite in the latter.

This necessity for a larger amount of coin is obvious when regarded only in relation to the increase of population. If population continues at its present rate of increase, a much larger amount of coin than we possess now, even with our £22,000,000 of bullion in the Bank, will be required to keep pace with its wants. But this is not the only view of the question. The population of 1851, it must be granted, required a larger amount of coin than that of 1801, or of any former period in our history, supposing each period to possess an equal amount of prosperity. But how stand the facts on this question of prosperity? If it should appear that, while more gold is discovered, more iron, more tin, more copper, more of every other mineral is also found; that more wool and cotton are produced, more corn is grown, more ships built, more houses built, more towns raised, more countries inhabited, and last, not least, that railways begin to intersect every country, old and new, and in combination with steamships on the ocean, to facilitate the communication among them all—then it would appear that they required a larger amount in proportion to the population; and that if prosperity continues on the increase, so constantly progressive will be the necessity for more coin, that scarcity will be a term applicable to gold, in all probability, for a long period of time.

The fact is, that the increase of commodities has been, in many instances, far greater than the increase

of population. In 1740, the total quantity of iron made in Great Britain was 17,350 tons; in the following hundred years, this quantity increased considerably more than a hundredfold, being estimated at the later period at above 2,000,000 tons. In 1801, the Cornish tin-mines produced 2328 tons of metal; it took only thirty years to double their annual amount. The same is more than true of the copper-mines of Cornwall, which produced in 1801, 5267 tons; and after thirty years, 11,224 tons. In 1828, the quantity of sheep's wool imported from Australia was 1,574,186 lbs.; in 1850, it was 39,018,228 lbs. In 1801, the coals shipped from Newcastle were 1,331,870 tons; in fifty years more than double—namely, 2,977,385 tons. These are only a few examples gleaned from many of a similar description, and to them we will only add the fact, of a kind totally new in the world's annals, that a sum approaching to a moiety of the national debt is now invested in railways in England alone—namely, upwards of L.350,000,000.

By a late police report, it appears that 60,000 houses have been added to the metropolis of England in the last ten years. These would alone form a large city, requiring much gold and silver for money and luxury; and in this question of gold, the requisitions of luxury must not be forgotten; they form an important item, and are commensurate with the necessity for coin.

'When,' said Adam Smith, 'the wealth of any country increases, when the annual produce of its labour becomes gradually greater and greater, a quantity of coin becomes necessary, in order to circulate a greater quantity of commodities; and the people as they can afford it, as they have more commodities to give for it, will naturally purchase a greater and greater quantity of plate. The quantity of their coin will increase from necessity, the quantity of their plate from vanity and ostentation, or from the same reason that the quantity of fine statues, pictures, and of every other luxury and curiosity, is likely to increase among them. But as statuary and painters are not likely to be worse rewarded in times of wealth and prosperity than in times of poverty and depression, so gold and silver are not likely to be worse paid for.'

It may, indeed, be predicted with tolerable certainty, that the qualities of 'beauty and utility' possessed by gold will be for a long time guarantees for its 'scarcity' whatever be its abundance. Its fine colour and brilliancy are not its only beauties. No metal is so ductile, so malleable, so indestructible by fire or chemical tests. It does not rust, it scarcely tarnishes, and it admits of the most exquisite workmanship. India alone would absorb the results of many years' digging; and when direct steam communication commences between it and Australia, gold will begin to flow into that great country, with its hundred million of people, in one continued stream, to supply their insatiable desire for it. They habitually invest their savings in gold ornaments, which they wear on their persons; and at this day, it is not uncommon to see the wife of a native under-secretary, whose salary and property altogether do not amount to much more than L.300 a year, wearing gold in this manner to the value of L.500. The treasure of this kind possessed by the rich natives is probably extraordinary; and so great is their desire to accumulate it, that it is impossible to keep up a gold-currency in the country: the coin is immediately melted down, and made into ornaments.

But whatever amount of gold is absolutely required at present as a circulating medium, and whatever amount is likely to be absorbed by the requirements of luxury, an amount far greater is likely to be needed to keep pace with the increasing prospects of prosperity in this country. Now that the restrictions on trade are nearly all removed, Britain may become the centre of the world's commerce: situated as she is in a temperate climate, between the Old and the New World, her

harbours never closed by ice, there is nothing to limit the extent of her markets, nothing to check the development of her resources, nor the division of her labour. The extraordinary impetus given to emigration by the discovery of the gold-fields, has already begun to create new and great countries; and every emigrant that leaves our shores becomes a source of wealth and strength to the mother-country, which has cast off the fetters that so long restrained its enterprise, and is open to trade with all the world; while the discovery of rich coal-mines in most parts of the globe, favours the communication by steam-power between both hemispheres, and almost from pole to pole; and while we hear of new discoveries that may make the air a motive power instead of steam, and thus render railway transit possible in arid deserts; and while the electric telegraph not only connects us with the continent of Europe, but is about to cross the Atlantic. With all these powers at command, men will not long be confined to the narrow boundaries in which they are at present congregated; and in comparison with future improvements in every branch of industry, the present time may come to be regarded as one when they were bunglers in industrial art, and mere scratchers of the soil instead of cultivators.

And not the least important among the elements of national prosperity, will be found an abundance of the circulating medium. 'Tis certain,' says Hume, 'that since the discovery of the mines in America, industry has increased in all the nations of Europe, except in the possessors of those mines; and this may justly be ascribed, amongst other reasons, to the increase of gold and silver. Accordingly, we find that in every kingdom into which money begins to flow in greater abundance than formerly, everything takes a new face—labour and industry gain life; the merchant becomes more enterprising; the manufacturer more diligent and skilful; and even the farmer follows his plough with greater alacrity and attention.'

The exception of Spain alone is a curious example and warning to nations, as shewing how the best gifts may be abused and converted into a curse instead of a blessing; for, believing the possession of gold and silver to be the only true wealth, they attempted to accumulate these metals by preventing the exportation of them by absurd restrictions; and this policy, added to her bigotry and persecution, has left Spain to this day an example of the results of restriction, powerless and poor, a haunt of the robber and the smuggler.

An abundance of the circulating medium will always be found to be an important element in national prosperity; and so great has been the conviction of this fact, that a whole school of political economists have advocated a paper-currency, in order to escape from the danger of restriction. 'Give us,' say they, 'paper-money, the basis of which shall be, not this scarce, restrictive gold, but the real wealth of the country in commodities of every kind.' It was Sir Robert Peel who explained the danger of these views, by shewing that paper-notes issued against commodities would tend to increase the fluctuations of the prices of those commodities. By the act of 1819, therefore, he established that a pound sterling, or the standard, by reference to which the value of every other commodity is ascertained, and every contract fulfilled, should be itself fixed to be a piece of gold of a certain weight and fineness, and that whatever paper-notes were issued, the holder should be entitled to demand standard coined gold in exchange for them at the Bank, at the rate of L.3, 17s. 10½d. of notes per ounce. Undertaking always to pay in coin when demanded, the Bank was allowed to use its own discretion in the amount of notes it might issue. Such discretion, however, was found to work badly, for the trading community in particular; and therefore, by the act of 1844, the issue of bank-notes was limited to the certain amount of

L.14,000,000 against securities; and it was enacted that any further issue must vary with and be equal to the amount of bullion deposited in the coffers of the Bank. The reason why L.14,000,000 in notes against securities was the sum fixed on, was partly that this was the smallest sum that had been known to be in the hands of the public for a very long period; and it is probable that numbers of these notes will never appear again, so many being perpetually lost by fires, shipwrecks, or carelessness. However, it is said, that only the other day a bank-note was presented for payment, bearing the date of 1750.

'To what end,' it is sometimes argued—'since even the advocates of gold-currency resort to paper-money as more convenient for practical purposes—is the accumulation of treasure in the vaults of the Bank of England? Why, after all the labour of digging it out of the earth in the antipodes, is it buried again here? Why not coin it, and lend it out at interest?' The remark is, of course, not unnatural, but has a ready reply. The gold in the vaults of the Bank of England belongs, not to the Bank, but to the holders of the bank-notes. They prefer notes to gold to carry in their pockets, but these rags of notes have no value in themselves; their sole value is as representatives of a certain portion of gold. People cannot have notes and the gold represented by the notes at the same time: they may have either that they like. If they prefer to have gold spoons, or gold candlesticks, or gold watches, or gold anything else; or if, as traders, they require to make purchases in any parts of the world where their notes would not pass current, or where those from whom they buy do not require any commodity manufactured in this country, then they can have their gold at the Bank any day by presenting their notes. As, moreover, the holder of every bank-note has an equal claim, *pro tanto*, on the bullion in the Bank coffers, the more gold there is in them, the more will his note represent. In short, the act of 1844, above alluded to, established the security of the Bank-of-England-note in a way that seems perfect.

On the whole, therefore, it appears that a condition requisite to national prosperity is in prospect for our country. Individual exceptions there may be in the persons of annuitants, but even here counteracting circumstances are continually at work. By improvements in machinery, and facility of communication, the cost of production is so much reduced as, in a greater or lesser degree, to balance the rise of price consequent on an abundance of gold, should any such condition of things actually occur; and an abundance of gold would undoubtedly, as we have shewn, be favourable to all these improvements. Already, the cost of production, or small amount of labour with which commodities can be produced, compared with former periods, is an important fact in all questions of income. The quantity of cotton wool, for example, taken for consumption in the United Kingdom in 1814, was 53,777,802 lbs., and in 1849 was 775,469,008 lbs.; but its value, which in 1814 was L.20,033,182, had only increased in 1849 to L.26,771,432: so that fifteen times the quantity at the latter period cost only about a third more money than the much smaller quantity in the former. The price of cotton-yarn was 8s. 9d. per lb. in 1801, and only 2s. 11d. in 1832, owing to improved machinery. Such examples might be multiplied, and would increase in accelerated ratio in times of increased prosperity. Other compensations would not be wanting. If the actual income of an annuitant should be lowered, his taxes would be lightened, his poor-rates perhaps abolished, his sons and daughters able to find openings in every direction. He would not be called on for charity; he might become enterprising and successful like his neighbours. It is scarcely possible that individual adversity should long co-exist with national prosperity.

A period may indeed arrive, discoveries may be in store, which may render a change in the standard of value an absolute necessity. Such a period, however, must be remote, and must be met by wise legislation as it gradually approaches. Meanwhile, we see nothing to stop the development of our resources, nor the increase of our wealth, so long as we use our good gifts and do not abuse them.

FRENCH COTTAGE COOKERY.

CONCLUDING ARTICLE.*

It may be gathered from the two former papers, that I am not in affluent circumstances; the intimation, therefore, that four distant relations, occupying a sufficiently high position in society, intended to dine with me, was received with a feeling the reverse of pleasurable, both by myself and my single servant. The dining-room and its table were so very small, that I never gave even family dinners. Rose had no idea of waiting; and, moreover, to cook and wait at one and the same time, is by no means an easy task for any one. I could not bear the idea of hired waiters and cooks, and the attendant noise, fuss, and expense. What was to be done? I thought over my dinner, but there was no room to place it on my small table, and the apartment would not hold a larger one conveniently. Rose could cook two dishes very well for my solitary self, but how were her unpractised powers equal to sending up a dinner for five persons, two of them men! It never struck me that Madame Miao could help me in this particular dilemma; nevertheless, as I wished to consult her about a sauce, I unconsciously unfolded my cause of annoyance.

'I see no difficulty at all,' said the worthy widow; 'and if you will only let me manage for you, I will answer for its all succeeding *à merveille*; but it must be *à la Française*.'

'But the fish?'

'Oh, your fish shall come first; *soyez tranquille*.'

'Anything you please, then,' answered I, gaining comfort from her easy, confident manner. I resolved to follow her instructions faithfully; for I was persuaded somehow that, whether she managed well or ill, her plan would probably be better than mine, and the result shewed I was right.

In the middle of the table, fresh flowers in a valuable china bowl did duty as an *aperçue*; port and sherry—the only wines I would, or, indeed, could present—stood at each corner; and round the bowl the little dessert, tastefully decorated with leaves, looked well, although consisting only of common dried fruits, preserved ginger, oranges, and cakes. But the plate was bright, the crystal clear, the table-cloth and napkins of the finest damask, and there was abundance of room for sauces, glasses, plates, and all the little things we might happen to require. As the company consisted of my private friends, not inhabitants of our town, Madame Miao herself—attired in a Bolognese cap, long gold earrings, cross, fluted lace tucker up to her collar bones, and black silk gown—condescended to wait upon and carve for us. She had each dish and its proper accompaniments brought by Rose to the side-table, where all was neatly divided into portions, and handed round, one dish at a time, hot from the fire. We had, first, ox-tail soup; second, fried soles; third, oyster *pâtés*; fourth, Maintenon cutlets and cauliflower; fifth, roast lamb and potato-ribbons; sixth, pheasant, with both bread-sauce and toast. Tartlets and creams followed, and a cream-cheese finished the repast; then we were left to our dessert and conversation, the latter of which we soon resolved to terminate with our coffee in the drawing-room, where a purer atmosphere awaited us. All went

off quietly and comfortably; no noise, no bustle, no asking will you have this or that; everything was brought round without questioning, and conversation was never for an instant interrupted. My fastidious cousin, Jack Falconbridge; his foolish fine-lady sister; her common-place lord; and her 'talented and travelled friend,' Miss Scribbleton, expressed themselves equally pleased, although there was nothing *recherché*, nothing expensive, nothing extraordinary. At the rich Mr Goldscamp's, where they had dined the day before, things were, they all agreed, very far inferior. Five or six inexperienced young footmen jostled against each other, whilst rushing about with sauces and condiments; the table groaned under a gorgeous display of plate, and loads of unnecessary glass and china.

'I was,' said Miss Scribbleton, 'really quite afraid to move, lest I should overturn or break something, and felt like a bull in a china-shop.'

'The cookery,' continued the Honourable John, 'was atrocious; everything half cold, and we rose hungry, to partake of watery coffee and lukewarm tea.'

'Ah!' sighed his sister, 'I was bored to extinction by everything and every person.' And then followed compliments to me upon my little unpretending entertainment, which I felt were sincere, for everything was good of its kind, and I presented nothing that Rose could not cook perfectly under Madame Miao's directions, except the soup and *pâtés*, which the pastry-cook supplied—all was hot, and all was quiet.

I have forgotten in the above enumeration the crowning dish of all, the Braousa, which drew down applause from the company; the Mayonnaise, in short, which Madame Miao concocted with her own hands. Every one thinks they can make the Mayonnaise sauce, because they find the ingredients given in various treatises upon cookery; but there is a secret, gastronomic reader, a very simple one; and this small secret I shall now unfold, by which, if you try, you will see that oil, vinegar, and egg, end in a very different result than when the usual mode of mixing them is employed. But ere I enlighten you, let me suggest to the Mesdames Jones and Thompsons, who will persist in giving dinners with few servants and small means, that if they adopt the above plan, they will better content their company, to say nothing of saving their money, than by pursuing the accustomed mode of killing off their acquaintance—namely, a huge 'feed' dressed by a common cook, and served by hired waiters, who, scuffling amongst strange plates and glasses, invariably crack many and break some.

A Mayonnaise.—Beat the yolk of a large quite freshly-laid egg, adding a little salt, with a teaspoonful of lemon juice: use a flat dish and a silver fork, and beat them thoroughly well together. Then take nearly a pint of the finest Lucca oil, which has been kept well corked from the air, and drop one drop. Keep beating the egg all the time, and add another drop—drop by drop at a time: it will take half an hour to do, and must be so thick as to require to be lifted by a spoon. Prepare your cold meat, lobster, chicken without skin, veal, or rabbit. Cut all in neat pieces, and set them round the centre of your dish; then take the very inside hearts of two or three cabbage lettuces, which have been well crisped in cold water, and place them round the meat. Cut two hard-boiled eggs in quarters, and some beet-root in strips, and place them tastefully, contrasting the colours. Now, with a spoon cover all with the sauce, laid on thickly, and upon it an anchovy cut in strips. Finish off with a nasturtium at the top, and also a row all round the outward edge.

Several days having elapsed since I had seen the friend in need, who had proved to me a friend indeed so lately, I went to ascertain whether her unusual exertions of body and mind had not made her ill, but was happy to find her in perfect health, seated at dinner with a very fine gentleman, all curls, compliments,

gilt chains, and earrings, whom she introduced as 'Mon neveu Antonio'—the son of her husband's sister, who had married an Italian, and who, like his father, was at once cook and courier. Their dinner consisted of the following *friture*, from M. Antonio's own private recipe-book: Have ready, half-cooked, 1st, thin slices of calves' liver; 2d, artichokes cut in half quarters or quarters, according to their size; 3d, cauliflower—only the *flower*, divided in small pieces; 4th, calves' brains, previously soaked in salt, vinegar, and water, for twenty-four hours, cut in little bits: make a light batter, and fry each separately of a golden brown in the right order, having the dish in which they are to be served on a hot hearth. Cover the dish with the liver, then the artichoke, then the brains, and, lastly, the cauliflower, each distributed so as to decrease towards the top, which is covered with a larger sprig of cauliflower.

Madame Miao fried beautifully, and, under her nephew's directions, tried a pretty dish I had never before heard of—namely, the flower of the cucumber-plant, or vegetable mallow—which is usually, and, I believe, incorrectly, called marrow—nipped off with the little fruit attached to it. It was dipped in butter, fried lightly, and served quite hot.

Creams are very good, made according to the following simple, inexpensive recipe, which is just enough to fill twelve small cups or glasses. Take good milk sufficient to fill them, and boil it with two ounces of grated chocolate, and six of white sugar; then beat the yolks of six eggs, to which add slowly the chocolate-milk, turning steadily one way. When quite mixed, pass the whole through a sieve, fill your cups, and, if you have not a regular *bain-marie*, a flat sauce-pan will do, filled to a proper height, so as not to overtop the creams, and which must continue boiling a quarter of an hour. For a change, instead of the chocolate, boil the milk with a pod of *vanille* broken in pieces, or any other flavour you may fancy.

Spinach Cream.—Boil your spinach, and let it thoroughly drain in a cullender; then press it through a hair-sieve with a spoon, as for food. Take the pulp that has been pressed through the sieve, and mix it with cream, or very good milk, and two additional yolks of eggs. Pass the yolks of six eggs through a sieve, add six ounces of white sugar in powder, and two table-spoonfuls of treble-distilled orange flower-water, and, as before mentioned, place the cups in a *bain-marie* for a quarter of an hour.

I requested the good-natured nephew to dress me a dish of macaroni, which he did as follows, one of his many modes of preparing it: He boiled it till just tender, and no more. The English cook it too much, he said. When drained, he grated a sufficient quantity of both Gruyère and Parmesan cheese, and alternately put upon the dish, first macaroni, and then cheese, finishing with the cheese. Over this he poured strong beef-gravy, in which some tomatoes had been dissolved, and put it a few minutes in the oven, and then a few more before the fire in a Dutch oven; but he preferred a hot hole, and to cover it with a *four de compagne*, or cover upon which you place hot embers. He also assured me the following sauce was better even than the beef-gravy:—

Tomato Sauce.—Warm your tomatoes until you can skin them; beat the pulp with finely-grated ham, onion, parsley, thyme, salt, and Lucca oil, all as small as possible; pass through a sieve, and pour over your macaroni. Serve hot.

Tomatoes are good skinned, the seeds taken out, and with a little butter and finely-chopped herbs, beaten into a paste with eggs, and fried in a light batter.

Fried Asparagus.—Do not boil it too much, but enough to cut in pieces and pass through a sieve; mix this with grated ham and Parmesan cheese, and with butter make it into a paste of good consistency, which fry in

a light batter. Celery is also very nice treated in the same way. As I like butter, as the French do, without any salt at all, I found much difficulty in keeping quite sweet what a farmer obligingly so prepared for me. Without water, it got bad. Made into pats, and kept in water, it lost flavour; but Madame Miao soon put me upon a plan by which it remained for ten days as if new churned. As soon as I received my quantum, I had it well washed in spring-water, for sometimes the milk had not been taken clean out of it; and then it was put down with a spoon in a salad bowl, to which it adhered. Every morning, fresh water, in which was dissolved a little salt, was poured upon it, and the top curled off for use with a tea-spoon or a small shell. To the very last, it was sweet and tasteless; and I consider this a very valuable hint, in hot weather especially.

AMUSEMENTS FOR THE PEOPLE.

We have become so accustomed to the idea of a soul-and-body-ruining intemperance amongst the lower portion of the working-classes, that only some startling details connected with it make any great impression upon us. Yet it is verily a most awful thing to exist in the midst of enlightened, advancing England. There are 1300 beer-shops in the borough of Manchester, besides 200 dram-shops. Thirty-nine per cent. of the beer-shops are annually reported by the police as disorderly. One dram-shop receives 10,000 visits weekly. In those of Deansgate, which are 28 in number, 550 persons, including 235 women and 36 children, were found at one time on a Saturday night. Many of the beer-shops are a haunt of the young of both sexes among the factory people, 'the majority with faces unwashed and hair uncombed, dancing in their wooden clogs to the music of an organ, violin, or seraphine.'

A considerable number of the public-houses of Manchester have music continually going on as an attraction. Twenty-four such houses are open on Sunday evenings. Two of them received 5500 visitors per week last winter. The most innocent of the favourite haunts of the people are casinos, or music-saloons, where multitudes assemble to witness scenic representations, feats of jugglery, tumbling, &c. 'Twopence is paid for admission, and for this the value is given in refreshments, most frequently consisting of ginger-beer. These places are comparatively innocent, but still are far from being what is required in that respect.'

It is a tremendous problem—how are we to give innocent amusement to the people? Perhaps there is none of our day more momentous. We try the lecture, and win an audience of units out of the thousands whom we seek to benefit. The reading-room, with penny cups of coffee, holds out its modest charms, and does much good, but still leaves the masses as it finds them. Something else is wanted, but it is difficult to say what it should be. Perhaps some clever person will hit upon it by intuition, or some ordinary one by accident, and so solve the problem. Perhaps it will be left to the philosopher to consider the human nature of the case, and divine what should be done. We can imagine him saying something like this: 'Man is a creature that requires novelty, variety, and excitement. He cannot be kept at duty continually; he must have pleasure too. He cannot be always at work on the real; he demands the ideal also. Even in the course of exertions which he relishes as conducing to his material interests, he every now and then requires a change of scene and of occupation. Something to divert the mind from its ordinary series of ideas—

something to enable us to lose ourselves in a temporary illusion, were it only a jocular supposition of our being something a good deal worse than we are—something, above all, to stir the hearty laugh, which proves its being good for us by the very help it gives to digestion—is required at frequent intervals—all free from what tends to debase and corrupt. Such is the theory of Amusement; and nothing which does not fulfil that theory will be effective for its ends. Here is a perquisition somewhat more startling than that of Xerxes, putting a prize upon a new pleasure. Happy will be the man who can devise truly available means of supplying this grand want in our Work-World! It is plainly for want of some such device that the public-house thrives, and that human nature is seen in such unlovely forms amongst the lower circles of society.'

It occurs to us, that there can be no social want which society itself is not competent to satisfy. In the variety of the human faculties, there are some which immediately tend to give pleasure and amusement, and certain men possess these in a greater degree than others. The *troubadour*, the *jongleur*, and the *joculator*, are natural productions of all time, in a certain proportion to the bulk of their kind. Accordingly, all through the various grades of society, we find clever people, exhibiting a gift for music, for mirth-making, for narration, and for dramatic effect. In the upper circles, these voluntary and unprofessional powers form the main dependence for the amusement of the evening. In the inferior walks of life, they are comparatively lost for want of a fair field to work in: they only find a vulgar and unworthy outlet in the coarse scenes of the tavern. Suppose we address ourselves to making arrangements by which humble society could be enabled to take advantage of the powers of amusement which lie within itself?

We can pretend to nothing like a scheme, and perhaps so much the better. We can imagine, however, that in certain circumstances, the desideratum could be tolerably well supplied without much outlay or formality. We have coffee and reading rooms already. Say that to such an institution, we add a music and conversation room; this, as a beginning. There, when the newspaper or book had ceased to charm, let a group assemble, and, according as there might be power present, enjoy itself with a tune, a song, a chorus, a recital, an elocutionary reading, a debate on some question, or a scene from a play. Presuming that the house is under the care of an honest, well-meaning person, there could be little fear of impropriety of any kind as resulting from such amusements. The amateur spirit guarantees plenty of such volunteer effort. Let it simply be understood, as in ordinary society, that each should do his best to promote the hilarity of the evening. If a single room succeeded, let two be tried—one for conversation alone, or for such games as cards and draughts (under strict regulation, to prevent any beyond nominal stakes); while the other served for music, and other entertainments not inferring silence. In the long-run, there might be further additions, allowing rooms for mutual instruction in various arts and accomplishments, sheds and courts for out-of-doors amusements, and so on.

If such establishments were ever to reach a public character, under what regulation should they be placed? We have no suggestion to make; but we embrace and maintain the principle, that the more they were understood to be under the protection of the public opinion of the class for whose benefit they are designed, the better. The patronising puritanism of another class would ruin everything. Let the other classes, if called on to assist, agree to view all that went on with a certain liberality of judgment, remembering that, although there may be some little possibilities of abuse, the whole project is, after all, an alternative from something infinitely worse; and in a fair course,

* The facts here adduced are from a recent contribution of Dr J. W. Hudson to the *Manchester Examiner*.

improvement is to be expected. It is one unfortunate necessity of the case, that a very small abuse in a system under a responsible administration, makes a great scandal against the administration itself; the public not reflecting, that that administration may be all the time tending to the repression, not the promotion of such abuses: hence the difficulty of getting responsible administrations in such cases at all. These, however, are difficulties to be struggled with, not given way to.

CORINNA AT THE CAPITOL.

BY MARIE J. EWEN.

THERE were footsteps on the Corso in the morning twilight
gray,
And gatherings in the Forum ere the rosy blush of day;
Loud voices round the Capitol, and on the marble stair,
A breathless crowd assembled, as for a triumph there.

The chimes of San Giovanni, how merrily they ring!
As if to all the city a soul of joy to bring:
There's noise of many chariots, and sounds of trampling
feet,
Of horses with their trappings gay, and minstrels in the
street.

And the balconies, what mean they with their tapestry so
fine?
And why are garlands wreathed around the arch of Con-
stantine?
What mean those banners streaming bright o'er tower and
glittering dome,
Ye ladies fair and gentlemen, that throng the streets of
Rome?

It is a day of triumph, and the brightest of its kind;
The victory of genius and the mastership of mind;
Corinna, the pride of Italy, descends the flower-wreathed
way,
For at the proud old Capitol she will be crowned to-day.

Right nobly prance her snow-white steeds; behold the
chariot come!
Room, room for her, the star of all! ye citizens of Rome.
Off with your hats, brave gentlemen! for genius is divine,
And never hath she made her home in such a lovely shrine.

She comes! the fair Corinna comes! 'mid thunders of
acclaim,
That rush unto the lips of all at the murmur of her name.
Scatter sweet roses all around; fling perfumes to the air;
And strew her path with all that breathes of beautiful and
fair.

Her car hath gained the Capitol—her foot is on the stair;
She stands a firm of matchless grace, the queen of
thousands there.
Bring forth the wreath that threw afresh a lustre round
his name,
Whose genius burned, a vestal fire, with never-dying flame.

Whose vision pierced the mantling mists that circle round
the tomb,
Where bitter groans resound for aye amid the starless
gloom;
Who saw the cities of the blest, and with as fearless tread
Paced through the ebon halls of hell, the mansions of the
dead.

The crown that might have cast a ray to light lone Tasso's
gloom,
But only drooped, a funeral wreath, to wither on his tomb;
Ay, reach it down, that laurel crown, it never hath been
given
To one more rich in beauty's grace, and all the gifts of
Heaven.

Oh, it is grand, a nation's love! a people's benison,
The homage of ten thousand hearts flung at the feet of one;

The rapturous glow that fires the soul, and thrills through
every frame,
At the mention of the worshipped one, the echo of her name.

Corinna at the Capitol! Oh, what a spell comes o'er me,
As I view the gorgeous pageantry that passeth now before
me;
But I would I knew the meaning of the tears which like a
stream
In pearly drops are shining through the rapture of her
dream.

Though laurel wreaths surround her brow, and glory lights
her name,
There is a chamber in her heart can ne'er be filled by fame;
Lonely, amid adoring crowds, she deems, as well she may,
The faithful love of one true heart were better worth than
they.

And when the crowd is parted, and the festival is o'er,
The many voices silent, and the music heard no more;
She will think upon the triumph, the splendour that is gone,
As the shadow of a dream, or the echo of a tone!

GOING AHEAD.

The reading of your paper on 'Railway Communica-
tion,' has given me great pleasure: your remarks about
American railways are very well in the main, but the
speed of travel is misstated, as it ranges from forty to
fifty miles an hour; unless it be an omnibus railway,
like the Haarlem, where they stop for passengers every
few hundred yards. The Hudson River Railway, which
passes by our mill at Yonkers, almost frightens my
brother out of his wits by its speed, and he takes the
steam-boat now to avoid it. The trains go very fast, but
it is a superb road, and very safe, as the servants of the
company, with their flags and lanterns, line the road the
whole distance. They have twenty trains a day. The
Erie Railway is also finished from New York to Lake
Erie; the traffic on this line is immense, freight often
lying two weeks before it can be put through. Its income
is over three and a half million dollars. We have only
one class of passengers, except emigrant trains: the fare
generally ranges from a cent and a quarter to two cents
a mile—on some of the shorter roads, as high as three or
four cents. All the carriages are lined with mahogany
and silk plush. The locomotives on our long roads weigh
from twenty to forty tons. The fact is, that anything
said about our physical development on data collected at
any one period, is quite likely to be false or absurd within
a twelvemonth. Though in the midst of it, and not one
of the excitable kind, I am often astonished at it myself.
I have several times mentioned that you would hardly
know New York, or find any of your old landmarks;
and yet New York would be comparatively a mean city,
if you took away what had been built within a year.
Steam-ships shew another phase of it: three years ago, we
hardly had the shadow of one; now—and I have looked
into the matter very carefully—I would not, as a com-
mercial speculation merely, exchange forty of the best
of our steam-ships for any other forty in the world: of
course I must not refer to war-steamers. Some of the Califor-
nia steam-ships are perfect pictures in model, and put the
Collins' Line into the shade. By the way, did you ever
notice their passenger-list?—from 300 to 600 at a trip;
and one vessel last year took 1125 passengers, paying very
nearly half her cost in a single trip. In the summer, they
slept about the decks like ants in a hill. A good educa-
tion, including a college one to those who have the proper
capacity, is open to every poor child in this city, free of
cost. The immense sums necessary to pay for all this
are voted by the people themselves out of their own
pocket.—*Private Letter from New York.*

Lane, Lombard Street, London, to whom all applications respect-
ing their insertion must be made.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 450. NEW SERIES.

SATURDAY, AUGUST 14, 1852.

PRICE 1½d.

HINTS ON THE USEFUL-KNOWLEDGE MOVEMENT.

THE advocates of the diffusion of useful knowledge among the great body of the people, found one of their greatest difficulties to lie in an inability on the part of the people themselves to see what benefit they were to derive from the knowledge proposed to be imparted. This knowledge consisted of such a huge mass of facts of all kinds, that few could overcome a sense of hopelessness as attending every endeavour to acquire it. Take botany alone, it was said. You have a hundred thousand species of plants to become acquainted with—to learn their names, and to what genera and orders they belong, besides everything like a knowledge of their habitats, their properties, and their physiology. Seeing that this is but one of the sciences, there might well be a pause before admitting that the moral and intellectual regeneration of our people was to be brought about by the useful-knowledge movement.

There was here, however, a mistake on both hands, and one which we are only now beginning to appreciate. It was not observed at first, that there is a great distinction to be drawn between the relations of science to its cultivators or investigators, and those which it bears to the community at large. It is most important that a scientific zoologist like Mr Waterhouse, or a profound physiologist like Professor Owen, should determine and describe every species with the minutest care, even to the slightest peculiarities in the markings of a shell or the arrangements of a joint, because that exactness of description is necessary in the foundations of the science. But it is not necessary that every member of the public should follow the man of science into all these minutiae. It is not required of him, that he should have the names of even the seventy families of plants at his finger-ends, though that is not beyond the reach of most people. Some summation of the facts, some adroit generalisation, if such be attainable, is enough for him. The man of science is, as it were, a workman employed in rearing up a structure for the man of the world to look at or live in. The latter has no more necessary concern with the processes of investigation and compilation, than a gentleman has with the making of the mortar and hewing of the stones used in a house which he has ordered to be built for his residence.

Were the facts of science thus generalised, it is surprising how comprehensive a knowledge of the whole system of the universe every person might have. Only generalise enough, and no one need to be ignorant. Just in proportion as a man has little time to bestow on learning, condense the more what you wish to

impart, and the result, where there is any fair degree of preparedness, will be all the better. In the very last degree of exigency, explain that nature is a system of fixed method and order, standing in a beneficial relation to us, but requiring a harmonious conformity on our part, in order that good may be realised and evil avoided, and you have taken your pupil by one flight to the very summit of practical wisdom. The most illustrious *savant*, while knowing some of the intermediate steps by which that wisdom was attained, and having many delightful subjects of reflection in the various phenomena involved in the generalisation, cannot go an inch further.

This is putting the matter in its extreme form. We are entitled to suppose that the bulk of mankind have some time to spend on the acquirement of a knowledge of the natural system of things into which their Maker has thrown them. Grant a little time to such a science, for example, as botany; we would never attempt impressing a vast nomenclature upon them. We would give them at once more pleasure and more instruction in shewing some of the phenomena of vegetable physiology: fundamental and profoundly interesting matters, of which specific distinctions and external characters of all kinds are only accidental results—that is, results determined by the outer phenomena affecting the existence of plants. A single lesson on the profound wonders of morphology would go further, we verily believe, in making our pupil a man of science, than the committing of the whole Linnæan system to memory. In zoology, again, we would leave the endless details of minute description to the tomes of the scientific naturalist, and be content to sketch animals in broad masses—first, in regard to grades of organisation; and, second, in regard to family types. The Feline Animal, we say, is one idea of the Creator—a destructive creature of wonderful strength in comparison with its bulk—of immense agility, furtive in its movements, furnished with great powers for the destruction of others. Lion, tiger, panther, ounce, lynx, jaguar, cat, are all essentially one creature—not the slightest difference can be traced in their osteological structure, hardly any in their habits. Why dwell, then, on minutiae of external appearances, if time presses, and there be much of more importance to be learned? So, also, is the Cirrhopode one idea of the author of nature. You may find a very respectable quarto account of the family, tracing them in all their varieties; but a page might inform you of all that is essential about the barnacle, curious as its history has been, and you need not ponder on the quarto unless you have some particular curiosity to gratify. The Types of nature, both in her vegetable and animal

departments are, after all, few. Describe each comprehensively, group them all in correct relations to each other, and display their various destinies and connections with the rest of creation, and you enable your pupil to learn in a few weeks more than Pliny mastered in a lifetime.

It appears to us that the reason why science is so coldly received in ordinary society is, that either by reason of its unripeness for generalisation, or of the tendency of its cultivators to keep continually analysing and multiplying facts, it has not in general been presented in propositions which the ordinary mind can comprehend or make use of. We should be loath to urge it into generalisations for which it was not prepared; but while this is duly avoided, we would have it to be somewhat more vigilant than it usually is, in taking opportunities of proceeding with those synthetical clumpings of facts which we conceive to be so essential, on mere grounds of convenience, to its success with the multitude. Better be a little dogmatical, than insupportably tedious. Better have your knowledge in some order, though not perhaps beyond correction, than in no order at all. It is to be feared, however, that the thing wanting is not the sufficiency of particulars out of which to make general or comprehensive truths, but that of the requisite intellectual power and habit on the part of the men of science. The constant working towards separate facts seems to disqualify the mind for grouping or clustering them. Hundreds can detect a new sphinx or butterfly in the fauna of a country or a county, and are content with such small results, for one who can lay a few facts together, and make one truth out of all. One could almost believe, that there is a greater want of comprehensive intellect in the walks of science, than in some other fields of labour which make less pretension to an exertion of the mental faculties: for example, merchandise. And does not that very appearance of continual peddling amongst trifles, in some degree prevent the highest kind of minds from going into the fields of science? There is here, it appears to us, a great error to be corrected.

Another cause why science makes little way with the multitude is, that there is too little connection to be observed between the ordinary proceedings of the scientific and learned, and the practical good of the community. The British Association meets, and has its week of notoriety, and when we look into the resulting volume, what do we find? Doubtless, many ingenious speculations and many curious investigations, which may in the long-run prove beneficial in some indirect way. But it must be admitted, that there is hardly anything bearing directly upon the great interests of contemporary humanity. The crying social evils of our time and country obtain no notice from the recognised students of science. To all appearance, the political error which legitimated scarcity would have never been put an end to by them. The sanitary evils which press so severely upon the health and morals of the common people, would apparently go on for ever, for anything that philosophers have to say to the contrary. What concern have they taken in the question of education, either in promoting its extension to the masses, or improving its quality? Our national councils, and every deliberative public body throughout the country, spend one half their time in wrangling about the most contemptible puerilities, without drawing one word of indignant comment, or one effort at correction, from the learned. The studious are like stars, and dwell apart. Busying themselves in a world of their own, exercising no visible influence on the current of

ordinary things, is it to be wondered at that the common people of the world put them and their pursuits almost as entirely out of account as they do the proceedings at Melton Mowbray? We grant it is not desirable that the *cui bono* should be the ruling consideration in matters of science; but we at the same time feel, that it would be well for it if it gave a little more attention to the social and moral questions affecting living interests, or at least endeavoured to bring its results to account in practical improvements of general utility.*

We must recur after all to the maxim which it is mainly the object of this paper to impress—that judicious generalisation is the indispensable pre-requisite to a more general diffusion of knowledge. To bring it to an apothegm—Let the man of science in seeking to enlighten himself, pursue analysis; in seeking to enlighten the outer public, he has no chance but in synthesis.

THE FALSE HAIR:

A TALE.

'PRAY remember, Monsieur Lagnier, that I wish particularly to go out this morning. It is now past one o'clock, and if you continue endeavouring to do what is quite impossible, my hair will never be dressed. You had much better plait it as usual.'

Adelaide de Varenne pronounced these words in a tone of pettishness very unusual with her, as, giving vent to a long sigh of impatience and weariness, she glanced hastily at the mirror on her toilet-table, and saw there reflected the busy fingers of M. Lagnier, the hairdresser, deliberately unfastening her hair, and preparing once more to attempt the arrangement, which repeated failures had declared to be an impossibility. He looked up, however, as he did so, and seemed to read the expression of her features, for a comic mixture of astonishment and dismay immediately overspread his own.

'Fifteen years,' he exclaimed, 'I have had the honour of daily attending mademoiselle, and she never was angry with me before! What can I have done to offend her?'

'Oh, nothing very serious,' replied the young girl, good-naturedly; 'but really I wish you would not dally so long. It is of very little consequence, I think, how one's hair is worn.'

'Why, certainly every style is equally becoming to mademoiselle,' was the old man's polite reply. 'Nevertheless, I had set my heart upon arranging it to-day according to the last fashion: it would suit mademoiselle à ravir.' Adelaide laughed.

'But you see it is impossible,' she said. 'I have so very little hair; and I am sure it is not my fault—nor,' she added archly, 'the fault of all those infallible pomades and essences recommended to me by somebody I know.' M. Lagnier looked embarrassed.

'Mademoiselle is so gay, she finds amusement in everything,' he replied. 'I cannot laugh upon so serious a subject.' Adelaide laughed again more heartily than before, and M. Lagnier continued, indignantly: 'Mademoiselle does not care for the loss of her beauty, then?'

'Oh, I did not know there was any question of that!' and the young girl suddenly resumed an expression of

* We have much pleasure in acknowledging one instance of a movement in the right direction, in connection with the Museum of Economic Geology in London. While nothing can exceed the beauty of the arrangements in that institution, for enabling everybody that chooses to study the science from the actual objects, the professors have, during the last winter, come forward with supererogatory zeal to teach the working-classes, and to illustrate in every possible way the bearings of the subject upon the arts and economy of life.

gravity, which completely imposed upon the simple old man.

'You see, mademoiselle,' he continued earnestly, 'I have been considering a long time what is best to be done. It is evident that my pomades, usually so successful, have no effect upon your hair; owing, I suppose, to—to—I can't say exactly what it is owing to. It is very strange. I never knew them to fail before. Would mademoiselle object to wearing a slight addition of false hair?' he asked anxiously, after a moment's pause.

'Indeed, I should not like it,' was the reply. 'Besides, Monsieur Lagnier, you have often told me that, in all Paris, it was impossible to obtain any of the same shade as mine.'

'Ah, but I have succeeded at last!' exclaimed he; and as he spoke, he drew triumphantly from his pocket a small packet, in which was carefully enveloped a long lock of soft golden hair.

'How beautiful!' Adelaide involuntarily exclaimed. 'Oh, Monsieur Lagnier, that is far finer and brighter than mine.'

'The difference is very slight indeed; it would be imperceptible when both were braided together,' returned the hairdresser. 'Do, pray, allow me, mademoiselle, to shew you the effect;' and without waiting for a reply, he commenced the operation. In a few moments it was completed, and the old man's delight was extreme. 'There!' he exclaimed in ecstasy. 'I knew the style would suit you exactly. Oh, mademoiselle, pray allow it to remain so; I should be au désespoir were I obliged to unfasten it now.'

Adelaide hesitated: it was, however, no conscientious scruple which occasioned her hesitation. She was a Frenchwoman, a beauty, and a little—a very little—of a coquette. To add to her attractions by the slight *supercheries* of the toilet was, she thought, a very venial sin; it was a thing which, in the society that surrounded her, was looked upon as necessary, and sometimes even considered as a virtue. She was a strange girl, a dreamer, an enthusiast, with a warm heart, and a lively, but perhaps too easily-excited imagination. From her infancy, she had been accustomed to reflect, to question, and to reason; but left almost entirely to her own unguided judgment, the habit was not in every respect favourable to the formation of her character. It was, however, but little injured by it. She was one of those favoured beings whom no prosperity can spoil, no education entirely mislead, and whose very faults arise from the overflowings of a good and generous nature. The thought which agitated her now was one worthy of her gentle heart.

'Monsieur Lagnier,' she said earnestly, 'such beautiful hair could only have belonged to a young person. She must have been in great distress to part with it. Do you know her? Did she sell it to you? What is her name? I cannot bear to wear it: I shall be thinking of her continually.'

'Ah, Mademoiselle Adelaide, that is so like you! Why, I have provided half the young ladies in Paris with false tresses, and not one has ever asked me the slightest question as to how or where they were obtained. Indeed, I should not often have been able to reply. In this case, however, it is different. I bought it myself, and consequently can give you a little information respecting it. Yesterday evening, I was standing at my door in the Rue St Honoré, when a young girl, attracted no doubt by the general appearance of my window, stopped to admire the various articles exhibited there. She had a pretty face, but I scarcely looked at that; I only saw her hair, her beautiful, rich, golden hair. It was pushed carelessly behind her ears, and half concealed beneath a little white cap. "Mademoiselle," I said, accosting her—for I could not bear that she should pass the door—"is there anything that you would like to buy? a pair of combs, for instance. I have some

very cheap; although," I added, with a sigh, as she appeared about to move on, "such lovely hair as yours requires no ornament." At these words, she returned quickly, and looking into my face, exclaimed: "Will you buy my hair, monsieur?" "Willingly, my child," I replied; and in another instant she was seated in my shop, and the bright scissors were gleaming above her head. Then my heart failed me, and I felt half inclined to refuse the offer. "Are you not sorry, child, to part with your hair?" I asked. "No," she answered abruptly; and gathering it all together in her hand, she put it into mine. The temptation was too great; besides, I saw that she herself was unwilling that we should break the contract. Her countenance never changed once during the whole time, and when all was over, she stooped, and picking up a lock which had fallen upon the ground, asked in an unfaltering voice: "May I keep this, monsieur?" I said yes, and paid her; and then she went away, smiling, and looking quite happy, poor little thing. After all, mademoiselle, what is the use of beauty to girls in her class of life? She is better without it.'

'And her name—did you not ask her name?' inquired Adelaide reproachfully.

'Why, yes, mademoiselle, I did. She told me that it was Lucille Delmont, and that she was by trade a *fleuriste*. It was all the information she would give me.'

'What could she have wanted with the money? Perhaps she was starving: there is so much misery in Paris!' continued Mademoiselle de Varenne, after a pause.

'She was very pale and thin,' said the hairdresser; 'but then so are the generality of our young citizens. Do not make yourself unhappy about it, mademoiselle; I shall see her again, probably, and shall endeavour to find out every circumstance respecting her.' With these words, M. Lagnier respectfully took leave, having by one more expressive glance testified his delighted approval of the alteration which had taken place in the young lady's appearance.

Adelaide, having summoned her maid, continued her toilet in a listless and absent manner. Her thoughts were fixed upon the young girl whose beauty had been sacrificed for hers, and an unconquerable desire to learn her fate took possession of her mind. Her intended disposal of the morning seemed quite to be forgotten; and she was on the point of forming new plans, very different from the first, when the lady to whose care she had been confided during the absence of her father from town, entered the apartment, and aroused her from her reverie by exclaiming: 'Ah, you naughty girl! I have been waiting for you this half hour. Was not the carriage ordered to take us to the Tuilleries?'

'Yes, indeed, it was; but I hope you will excuse me: I had almost forgotten it.' And Adelaide immediately related to her friend the circumstance which had occurred, and begged her aid in the discovery of Lucille. Madame d'Héranville laughed—reasoned, but in vain; and, finding Adelaide resolved, she at length consented to accompany her upon the search, expressing as she did so her entire conviction that it would prove useless and unsatisfactory.

The day was spent in visits to the principal *modistes* of Paris; but from none could any information be gained concerning the young flower-girl. None had ever even heard her name. Adelaide was returning home, disappointed, but not discouraged. Still resolved to continue her endeavours, she had just announced to Madame d'Héranville her intention of visiting upon the following day the shops of an inferior class, when the carriage was suddenly arrested in its course by the crowd of vehicles which surrounded it, and they found themselves exactly before the door of a small warehouse of the description she alluded to. She was about to

express a wish to enter, it being still early, when her attention was attracted by two persons who stood conversing near the door, and whose voices, slightly raised, were distinctly audible. They had excited the interest and curiosity of both Adelaide and her companion by the earnestness of their manner, and by the expression of sorrow depicted upon the countenance of the elder speaker, a young man of about twenty-five years of age, who, from his costume, as well as accent, appeared to be a stranger in Paris.

'I have promised—will you not trust me?' he said in a half-reproachful tone; and Adelaide bent eagerly forward to catch a glimpse of the young girl to whom these words were addressed; but her face was turned away, and the large hood of a woollen cloak was drawn over her head, almost completely concealing her features.

'I do trust you,' she said in reply to the young man's words.—'I do indeed. And now, good-by, dear André; we shall meet again soon—in our own beautiful Normandy.' And she held out her hand, which he took and held for an instant without speaking.

'May I not conduct you home?' he asked at length.

'No, André; it is better that we should part here. We must not trust too much to our courage, it has failed us so often already.' And as she spoke, she raised her head, and looked up tearfully at her companion, disclosing as she did so a face of striking beauty, although worn and pallid to a painful degree, and appearing even more so than it really was from the total absence of her hair. The tears sprang to Adelaide's eyes. In the careworn countenance before her she read a bitter tale. Almost instinctively, she drew forth her purse, and leaning over the side of the carriage, called 'Lucille! Lucille!' But the young girl did not hear her; she had already turned, and was hastening rapidly away, while André stood gazing after her, as if uncertain of the reality of what had just occurred. He was so deeply engrossed in his reflections, that he did not hear his name repeatedly pronounced by both Adelaide and her friend. The latter at length directed the servant to accost him, and the footman was alighting for that purpose, when two men turned quickly the corner of the street, and perceiving André, stopped suddenly, and one of them exclaimed: 'Ah, good-evening, Bernard; you are just the very fellow we want;' and taking André by the arm, he drew him under the shade of a *porte cochère*, and continued, as he placed a small morocco case in his hand: 'Take care of this for me, André, till I return: I shall be at your lodgings in an hour. Giraud and I are going to the Cité, and as this pocket-book contains valuables, we are afraid of losing it. *Au revoir!*'

André made no reply. He placed the pocket-book carelessly in his bosom, and his two friends continued hastily their way. He was himself preparing to depart, when the footman touched him gently on the shoulder, and told him of Mademoiselle de Varenne's wish to speak to him. André approached the carriage, surprised and half abashed at the unlooked-for honour; then taking off his cap, waited respectfully for one of the ladies to address him. At the same instant, a police-officer seized him roughly by the arm, and exclaimed: 'Here is one of them! I saw them all three together not two hours ago!' And calling to a comrade who stood near, he was about to lead André away. At first, the young man made no resistance; but his face grew deadly pale, and his lip trembled violently.

'What do you want? What have I done?' he demanded at length, turning suddenly round to face his accuser; but the latter only replied by a laugh, and an assurance that he would know all about it presently. A slight struggle ensued, in the midst of which the pocket-book fell to the ground, and a

considerable number of bank-notes bestrewed the pavement. At this sight, André seemed suddenly to understand the cause of his arrest; he stood for an instant gazing at the notes with a countenance of horror; then, with an almost gigantic effort, he broke from the grasp which held him, and darted away in the direction which had before been taken by the young girl. He was immediately followed by the police; but although Adelaide and her friend remained for some time watching eagerly the pursuit, they were unable to ascertain whether he had succeeded in effecting his escape.

'I am sure I hope so, poor fellow!' murmured Adelaide as they drove homewards—'for Lucille's sake, as well as for his.'

'You have quite made up your mind, then, as to its being Lucille that we saw?' said Madame d'Héranville with a smile. 'If it was,' she added, more gravely, 'I think she can scarcely merit all the trouble you are giving yourself on her account. Her friendship for André does not speak much in her favour.'

'Why not? Surely you do not think he stole the pocket-book?' asked Adelaide, in undisguised dismay.

'Perhaps not; but his intimacy with those who did, leads one to suppose that he is not unaccustomed to such scenes. You remember the old proverb: "*Dis moi qui tu hantes, je te dirai qui tu es.*"

'Do you not think we should give information respecting what we saw? He was certainly unconscious of its contents?' asked Adelaide again, after a short silence.

'He appeared so,' returned Madame d'Héranville; 'and I shall write to-morrow to the police-office. Perhaps our evidence may be useful to him.'

'To-morrow!' thought Adelaide; but she did not speak her thoughts aloud. 'And to-night he must endure all the agonies of suspense!' And then she looked earnestly at her companion's face, and wondered if, when hers, like it, was pale and faded, her heart should also be as cold. A strange, sad feeling crept over her, and she continued quite silent during the remainder of the drive. Her thoughts were still busy in the formation of another plan for the discovery of Lucille, when, upon her arrival at home, she was informed that M. Lagmër desired anxiously to see her, having something to communicate.

'Mademoiselle, I have not been idle,' he exclaimed, immediately upon entering the apartment. 'Here is Lucille's address, and I have seen her mother. Poor things!' he added, 'they are indeed in want. Their room is on the sixth floor, and one miserable bed and a broken chair are all the furniture. For ornament, there was a rose-tree, in a flower-pot, upon the window-seat: it was withered, like its young mistress!'

'They are not Parisians?' inquired Adelaide.

'No, no, mademoiselle. From what the mother said, I picked up quite a little romance concerning them. The husband died two years ago, leaving them a pretty farm, and a comfortable home in Normandy. Lucille was very beautiful. All the neighbours said so, and Mrs Delmont was proud of her child. She could not bear her to become a peasant's wife, and brought her here, hoping that her beauty might secure to her a better fate. The young girl had learned a trade, and with the assistance of that, and the money they had obtained upon selling the farm, they contrived to manage very well during the first year. Lucille made no complaint, and her mother thought she was happy. A Parisian paid her attention, and asked her to become his wife. She refused; but as he appeared rich, the mother would not hear of declining the offer. She encouraged him to visit them as much as possible, and hoped at length to overcome Lucille's dislike to the marriage. One evening, however, as they were all seated together, a young man entered the room. He had been an old lover of Lucille's—a neighbour's son, and an early playmate. She sprang forward eagerly

to meet him, and the rich pretender left the place in a fit of jealous anger, and they have not seen him since. Then troubles came, one following another, until at last they fell into the state of destitution in which I found them. André Bernard, who had quarrelled with his parents in order to follow them, could find no work, and every sou that Lucille gained was given to him, to save him, as she said, from ruin or from sin. Last week she sold her hair, to enable him to return home. She had made him promise that he would do so, and to-night he is to leave Paris.'

'It is he, then, whom we saw arrested!' exclaimed Adelaide; 'and he will not be able to return home. Oh, let us go to Lucille at once! Do, pray, come with me, Madame d'Héranville!' and turning to her friend, she pleaded so earnestly, and the large tears stood so imploringly in her eyes, that it was impossible to resist. Madame d'Héranville refastened her cloak, and soon afterwards, with Adelaide and M. Lagnier, found herself ascending the steep and dilapidated staircase of the house inhabited by the Delmonts. Adelaide seated herself upon the highest step, to await the arrival of her friend, whose agility in mounting was not quite equal to her own. As she did so, a loud and angry voice was heard proceeding from the apartment to which this staircase led. It was followed by a sound as of a young girl weeping, and then a few low, half-broken sentences were uttered in a voice of heart-broken distress.

'Mother, dear mother,' were the words, 'do not torture me. I am so ill—so wretched, I wish I were dead.' 'Ill! wretched! ungrateful girl!' was the reply. 'And whose fault is it that you are so? Not mine! Blame yourself, if you will, and him, your darling André. What will he do now that you have no more to give? nothing even that you can sell, to supply him with the means of gratifying his extravagance. You will soon see how sincere he is in his affection, and how grateful he feels for all the sacrifices that you have made—sacrifices, Lucille, that you would not have made for me.'

'Mother,' murmured the poor girl in a tone of heart-broken reproach, 'I have given my beauty for him; but I have given my life for you.' Adelaide listened no more. Shocked beyond measure at the misery expressed in the low, earnest voice of Lucille, she knocked at the door of the apartment, and scarcely waiting for permission, lifted the latch and entered hurriedly.

Lucille was seated at a window working, or seeming at least to do so; for her head was bent over a wreath of artificial flowers, through which her emaciated fingers passed with a quick convulsive motion. It needed not, however, a very nice observation to discover that the work progressed but slowly. The very anxiety with which she exerted herself, seemed to impede her movements, and the tears which fell from time to time upon the leaves obscured her sight, and often completely arrested her hand. She did not raise her head as Adelaide entered; too deeply engrossed in her own sadness, she had not heard the opening of the door, or her mother's exclamation of surprise, and Mademoiselle de Varenne was at her side before she was in the least conscious of her presence. Adelaide touched her gently on the arm.

'What is the matter, Lucille?' she asked. 'Tell me: I will do all I can to help you.' At these words the mother interposed, and said softly: 'I am sure, madame, you are very kind to speak so to her. I am afraid you will find her an ungrateful girl; if you had heard her words to me just now—to me, her own mother!'

'I did hear them,' returned Adelaide. 'She said she had given her life for you. What did she mean? What did you mean, Lucille?' she asked, gently addressing the young girl, whose face was buried in her hands.

'Forgive me, mother; I was wrong,' murmured Lucille; 'but I scarcely know what I say sometimes. Mademoiselle,' she continued earnestly, 'I am not ungrateful; but if you knew how all my heart was bound to home, and how miserable I am here, you would pity and forgive me, if I am often angry and impatient.'

'You were never miserable till he came,' retorted the mother; 'and now that he is going, you will be so no more. It will be a happy day for both of us when he leaves Paris.' At this moment heavy steps were heard ascending the stairs; then voices raised as if in anger. Lucille started up; in an instant her pale cheek was suffused with the deepest crimson, her eye flashed, and her whole frame trembled violently. Her mother grasped her by the hand, but she freed herself with a sudden effort, and darting past Madame d'Héranville and the hairdresser, who had entered some time before, she ran out upon the landing. Adelaide followed, and at once perceived the cause of her emotion. André was rapidly ascending the stairs, his countenance pale, and his whole demeanour indicating the agitation of his feelings. He was closely followed by the police-officer, whose voice, as he once more grasped his prisoner, appalled the terrified Lucille. 'You have given us a sharp run,' he exclaimed, 'and once I thought you had got off. You should not have left your hiding-place till dark, young gentleman.' And, heedless of the frantic and agonised gestures of the unhappy youth, he drew him angrily away.

Lucille sprang forward, and taking André's hand in hers, she looked long and earnestly in his face. He read in her eyes the question she did not dare to ask, and replied, as a crimson blush mounted to his forehead: 'I am accused of robbery, Lucille, and many circumstances are against me. I may perhaps be condemned. I came here to tell you of my innocence, and to return you this;' and he placed a gold piece in her hand. It was the money she had given him for his journey—the fruit of the last sacrifice she had made. She scarcely seemed to understand his words, and still looked up inquiringly. 'Lucille,' he continued, 'they are taking me to prison; I cannot go home as I promised; but you will not think me guilty. How could I do what I knew would break your heart?'

She smiled tenderly and trustfully upon him; then letting fall his hand, she pushed him gently away, and whispered: 'Go with him, André. Justice will be done. I am no longer afraid.' Madame d'Héranville and Adelaide at this moment approached, and eagerly related what they had seen, both expressing their conviction of the young man's innocence.

'It is not to me you must speak, ladies,' returned the gendarme, wonderfully softened by their words. 'If you will be so good as to give me your names, and come to-morrow to our office, I have no doubt that your evidence will greatly influence the magistrate in favour of the prisoner.' The ladies gave their names, and promised to attend the court the following morning; and shortly afterwards, they left the house, having by their kind promises reassured the weeping girl, and succeeded in softening her mother's anger towards her. The next day they proceeded early to the court. As Adelaide entered, she looked round for Lucille, and perceived her standing near the dock, her earnest eyes fixed upon the prisoner, and encouraging him from time to time with a look of recognition and a smile. But notwithstanding all her efforts, the smile was a sad one; for her heart was heavy, and the appearance of the magistrate was not calculated to strengthen her hope. André had declared his innocence—his complete ignorance of the contents of the pocket-book his friend had placed in his hand; but his very intimacy with such men operated strongly against him. Both Giraud and his companion were well known to the police as men of bad character, and

very disreputable associates. The prisoner's declaration, therefore, had but little effect upon those to whom it was addressed; and the magistrate shook his head doubtfully as he listened. Madame d'Héranville and Adelaide then related what they had seen—describing the young man's listless look as he received the book, and endeavouring to prove, that had André been aware of its contents, his companion need scarcely have made the excuse he did for leaving it with him. At this moment, a slight movement was observed among the crowd, and two men were brought forward, and placed beside André. At their appearance, a scream escaped from Lucille; and, turning to her mother, she pointed them out, while the name of Jules Giraud burst from her lips. Hearing his own name, one of the men looked up, and glanced towards the spot where the young girl stood. His eyes met hers, and a flush overspread his face; then, after a momentary struggle, which depicted itself in the workings of his countenance, he exclaimed: 'Let the boy go: we have injured him enough already. He is innocent.'

'What do you mean?' inquired the magistrate; while a look of heartfelt gratitude from Lucille urged Giraud to proceed.

'André knows nothing of this robbery,' he continued; 'his sole connection with us arises from a promise we gave him, to find him employment in Paris; and all the money he received we took from him under the pretence of doing so. Yesterday morning, we met him for the purpose of again deceiving him, but failed. He had a louis-d'or; but it had been given him by his fiancée, that he might return home, and he was determined to fulfil his promise. I would have taken his last sou; for he—'and the destined *forger* ground his teeth—'for he owed me a debt! However,' he continued recklessly, 'it is all over now. I am off for the galleys, that's clear enough; and before starting, I would do something for Lucille.'

'How had the accused harmed you?' asked the magistrate.

Giraud hesitated; but Madame Delmont came forward, and exclaimed: 'I will tell you, monsieur. He wished to marry my daughter himself; and I,' she added, in a tone of deep self-reproach, 'would almost have forced her to consent.'

The same evening, Madame Delmont, André, and Lucille were seated together, conversing upon what had passed, and deliberating as to the best means of accomplishing an immediate return to Normandy, when a gentle tap was heard at the door, and the old hairdresser entered the room. He appeared embarrassed; but at length, with a great effort restraining his emotion, he placed a little packet in Lucille's hand, and exclaimed: 'Here, child, I did not give you half enough for that beautiful hair of yours. Take this, and be sure you say nothing about it to any one, especially to Mademoiselle Adelaide;' and without waiting for one word of thanks, he was about to hurry away, when he was stopped by Mademoiselle de Varenne in person.

'Ah, Monsieur Lagnier,' she merrily exclaimed, 'this is not fair. I hoped to have been the first; and yet I am glad that you forestalled me,' she added, as she looked into the bright glistening eyes of the old hairdresser. 'My father has just arrived in town, Lucille,' she continued, after a short pause, 'and he is interested in you all. He offers André the porter's lodge at the château, and I came here immediately to tell you the good news. It is not very far from your old home, and I am sure you will like it. Do not forget to take with you this poor rose-tree; it looks like you, quite pale for want of air. There! you must not thank me,' she exclaimed, as Madame Delmont, André, and Lucille pressed eagerly forward to express their gratitude: 'it is I, rather, that should thank you. I never knew till now how very happy I might be.'

And as Adelaide de Varenne pronounced these words,

a bright smile passed across her face. The old hairdresser gazed admiringly upon her, and doubted for a moment whether the extraordinary loveliness he saw owed any part of its charm to the lock of false hair.

CLOUDS OF LIGHT.

In March of the year 1843, a remarkable beam of light shot suddenly out from the evening twilight, trailing itself along the surface of the heavens, beneath the belt stars of Orion. That glimmering beam was the tail of a comet just whisked into our northern skies, as the rapid wanderer skirted their precincts in its journey towards the sun. To the watchful eyes of our latitudes, the unexpected visitant presented an aspect that was coy and modest in the extreme; its head, indeed, was scarcely ever satisfactorily in sight. But it dealt far otherwise with the more favoured climes of the south. At the Cape of Good Hope, it was seen distinctly in full daylight, and almost touching the solar disk; and at night appeared with the brilliancy of a first-class star, with a luminous band flowing out from it to a distance some hundred times longer than the moon's face is wide. Few persons who caught a glimpse of that shining tail, either as it fitfully revealed itself in our heavens, or as it steadily blazed upon the opposite hemisphere of the earth, were led to form adequate notions of the magnificence of the object they were contemplating. No one, unaided by the teaching of science, could have conceived that the streak of light, so readily compressed within the narrow limits of an eye-glance, stretched out 170 millions of miles in length.

The comet comes from regions of unknown remoteness, and rushes, with continually increasing speed, towards our own source of warmth and light—the genial sun. When it has reached within a certain distance of this object, it appears, however, to overshoot the mark of its desire, as if too ardent in the chase, and then sways round with fearful impetus, beginning reluctantly to settle out into space again, and moving with less and less velocity as it goes, until its misty form is once more withdrawn by distance from human sight. When the comet of 1843 swept round the sun in this way, it was so near to the shining surface of the solar orb, that it must have been rushing for the time through a temperature forty-seven thousand times higher than any which the torrid region of the earth ever feels. Such heat would have been twenty-four times more than enough to melt rock-crystal. The overburdened sense experiences a feeling of relief in the mere knowledge, that the comet passed this fiery ordeal as the lightning's flash might have done. In two short hours, it had shifted its place from one side to the other of the solar sphere. In sixty little minutes, it had moved from a region in which the heat was forty thousand times greater than the fiercest burning of the earth's torrid zone, into another, in which the temperature was four times less. The comet might well have a glowing tail as it came from such a realm of fire. Flames that were colder by many hundred times, would make the dull black iron shine with incandescent brightness.

As, however, it is the comet's nature to guard its ornamental appendages with jealous care, it may be conceived that this tail of 170 million miles might prove a somewhat troublesome travelling companion in so rapid a journey. Comets always turn their tails prudentially out of harm's way as they whisk through the neighbourhood of the solar blaze. In whatever

direction these bodies may be moving, they are always seen to project their caudal beams directly from the sun. Imagine the case of a rigid straight stick, held by one end in the hand, and brandished round through a half-circle. The outer end of the stick would move through a considerable sweep. If the stick were 170 million miles long, the extent of the sweep would be not less than 500 million miles! Through such a stupendous curve did the comet of 1848 whirl its tail in two little hours as it rounded the solar orb. It is hardly possible to believe, that one and the same material substance could have been subjected to the force of such motion without being shattered into a myriad fragments. Sir John Herschel very beautifully suggests, that the comet's tail, during this wonderful perihelion passage, resembled a negative shadow cast beyond the comet, rather than a substantial body; a momentary impression made upon the luminiferous ether where the solar influence was in temporary obscuration. But this suggestion can only be received as an ingenious and expressive hint; it cannot be taken as an explanation. There is as much difficulty, as will be presently seen, in the way of admitting that comets have shadows of any kind, as there would be in compassing the idea that bodies of enormous length can be whirled round through millions of miles in the minute. The truth is, the comet's tail is yet an unguessed puzzle, and vexes even the wits of the wise. It keeps grave men seated on the horns of a dilemma, so long as their attention is fixed upon its capricious charms.

The comet's tail is always thrown out away from the sun, just as the shadow of an opaque body in the same position would be. But this is not all that can be said of it. It is not only cast away from the sun; it is really cast by the sun—shadow-like, although not of the nature of shadow. It only appears when the comet gets near to the sun's effulgence, and is lost altogether when that body gets far from the great source of mundane light and heat. It is raised from the comet's body, by the power of sunshine, as mist is from damp ground. When Halley's Comet of 1682 approached the fierce ordeal of its perihelion position, the exhalation of its tail was distinctly perceived. First, little jets of light streamed out towards the sun, as if bursting forth elastically under the influence of the scorching blaze; very soon these streams were stopped, and turned backwards by the impulse of some new force, and as they flowed in this fresh direction, became the diverging streaks of the tail. Not only a vapour-forming power, but also a vapour-drifting power, is brought into play in the process of tail formation; and this latter must be some occult agent of considerable interest in a scientific point of view, as well as of considerable importance in a dynamic one, for it is a principle evidently antagonistic to the great prevailing attribute of gravitation, so universally present in matter. The comet's tail is the only substance known that is repelled instead of being attracted by the sun.

The repulsive power to which the development of the comet's tail is due, is one of extraordinary energy. The comet of 1680 shot out its tail through something like 100 million miles in a couple of days. Most probably, much of the matter that is thus thrown off from the cometic nucleus is never collected again, but is dissipated into space, and lost for ever to the comet. The tail of the comet of 1680 was seen in its greatest brilliancy soon before the solar approach; this was, however, an exception to the general rule. Comets nearly always have the finest tails, and present altogether the most beautiful appearance, immediately after they have been in the closest proximity to the sun.

The comet's tail seems, in reality, to be a thin oblong case of vapour, formed out of the cometic substance by the increasing intensity of the sunshine, and enclosing the denser portion of that substance at one end. The diverging streams which it displays upon the sky are

merely the retiring edges of the rounded case, where the greatest depth of luminous matter comes into sight. As the comet nears the sun, much of its substance is vaporised for the construction of this envelope; but as it goes off again into remoteness, the vaporous envelope is once more condensed. The tail may then be seen to flow back towards the head, out of which it was originally derived.

But here, again, a difficulty presents itself. The comet's tail is believed by most of the illustrious astronomers of the day, to be the body converted into vapour by solar influence. If it be so, the vaporising process must be a much more subtle one than any that could be performed in our alembics, for the comet's substance is already all vapour before the distillation commences. The faintest stars have been seen shining through the densest parts of comets without the slightest loss of light, although they would have been effectually concealed by a trifling mist extending a few feet from the earth's surface. Most comets appear to have bright centres—nuclei, as they are called; but these nuclei are not solid bodies, for as soon as they are viewed by powerful telescopes, they become as diffused and transparent as the fainter cometic substance. Comets are properly atmospheres without contained spheres; enormous clouds rushing along in space, and bathed with its sunshine, for they have no light excepting sunlight. They become brighter and brighter as they get deeper within the solar glare, and dimmer and paler as they float outwards from the same. The light of the comet only differs from the light of a cloud that is drifted across the cerulean sky of noon, in the fact, that it is reflected from the inside as well as the outside of the vaporous substance. The material illuminated reflects light, and is permeated by light, at once. In this respect it resembles air as much as cloud—the blueness of the sky is the sunlit air seen through the lower and inner strata of itself. In the same way, the whiteness of the comet is sunlit vapour seen through portions of itself. The sunbeams pass as readily through the entire thickness of the cometic substance as they do through our own highly permeable atmosphere.

The belief in the comet's surpassing thinness and lightness is not a mere speculative opinion. It rests upon incontrovertible proof. In 1770, Lexell's Comet passed within six times the moon's distance of the earth, and was considerably retarded in its motion by the terrestrial attraction. If its mass had been of equal amount with the earth's mass, its attraction would have influenced the earth's movement in a like degree in return, and the earth would have been so held back in its orbital progress in consequence, that the year would have been lengthened to the extent of three hours. The year was not, however, lengthened on that occasion by so much as the least perceptible fraction of a second; hence it can be shewn, that the comet must have been composed of some substance many thousand times lighter than the terrestrial substance. Newton was of opinion, that a few ounces of matter would be sufficient for the construction of the largest comet's tail.

Light as the comet's substance is, it is not, however, light enough to escape the grasp of the sun's gravitating attraction. When the mass of thin vapour is rushing through the obscurity of starlit space, so far from the sun that the solar sphere looks but the brightest of the stellar host, it feels the influence of the solar mass, remote as it is, and is constrained to bend its course towards it. Onwards the thin vapour goes, the sun waxing bigger and bigger with each stage of approach, until at last the little star has become a fiery globe, filling up half the heavens with its vast proportions, and stretching from the horizon to the zenith of the visible concave. The great comet of 1680 came in this way from a region of space where the sun looked but

half as wide as the planet Mars in the sky, and where the solar heat was imperceptible, the surrounding temperature being 612 degrees colder than freezing water, into another in which the sun filled up 140 times greater width of the sky than it does with us, and where the heat was some hundred times higher than the temperature of boiling water. It was then only 880,000 miles away from the solar surface, and would have fallen to it in three minutes, in obedience to its attraction, if the impetus of its motion in a different direction had been on the instant destroyed or arrested. But this impetus proved too great for the attraction, light as the material of the moving body was. When the comet has approached comparatively near to the grand source of attraction, the speed of its accelerating motion has become so excessive, that it is able to withstand the augmented solicitation it is subjected to, and move outwards in a more direct course. It goes, however, slower and slower, and curving its journey less and less, until at last its motion in remote obscurity is again so sluggish, that the sun's attraction is once more predominant, and able to recall the truant towards its realms of light. Such is the history of the comet's course.

Thin comet vapours drift through space, sustained by exactly the same influences that uphold dense planetary spheres. They are supported in the void by the combined effects of motion and attraction. Their own impetus strives to carry them one way, while the sun's attraction draws them another, and they are thus constrained to move along paths that are intermediate to the lines of the two impulses. Now, when bodies are driven in this way by two differently acting powers, they must travel along curved lines, if both the driving forces are in continued operation, for a new direction of motion is then impressed on them at each succeeding instant. There are three kinds of curved lines along which bodies thus doubly driven may move: the *circular* curve, which goes round a central point at an unvarying equal distance, and returns into itself; the *elliptical* curve, which returns into itself by a route that is drawn out considerably in one direction; and the *hyperbolic* curve, that never returns into itself at all, but has, on the other hand, a course which sets outwards each way for ever. The *parabolic* curve, as it is called, is a line partaking of the closeness of the ellipse on the one hand, and the openness of the hyperbola on the other. A parabola is an ellipse passing into a hyperbola; or, in other words, it is a part of an ellipse whose length, compared with its breadth, is too great to be estimated, and is consequently deemed to be endless for all practical purposes.

In most instances, comets move in space, about the sun, in ellipses so very lengthened, that their paths seem to be parabolas as long as the cloudy bodies are visible in the sky. Two of them, Ollier's Comet and Halley's, are known to return into sight after intervals of seventy-four and seventy-six years, during which they have visited portions of space a few hundred millions of miles further than the orbit of Neptune. Six comets travel in elliptical orbits that are never so far from the sun as the planet Neptune, and return into visibility in short periods that never exceed seven or eight years. These interior comets of short period seem to be regular members of our world-system in the strictest sense. Their paths, although more eccentric, are all contained in planes that nearly correspond with the planes of the planetary orbits, and they travel in these paths in the same general direction with their planetary brethren in every case. The planetoid comets of short period are—Encke's, De Vico's, Brorsen's, D'Arrest's, Biela's, and Fage's. The comet of 1843 is half-suspected to belong to the group, and to be also a periodic body, revisiting our regions punctually at intervals of twenty-one years.

The comet's motions strikingly illustrate the almost

absolute voidness of space. If the thin vapour experienced any resistance while moving, its free passage would be checked, although that resistance was many thousand times less than the one the hand feels when waved in the air. It is found, however, that Encke's Comet does indicate the presence of some such resistance. It goes slower and slower with each return, and contracts the dimensions of its elliptical journey progressively. But it must be remembered, that this is one of the close comets that never gets well out of the solar domain in which our neighbouring planets float. The resisting medium which opposes its journey may be merely an ethereal solar atmosphere surrounding the sun, as our air surrounds the earth, but spreading to distances of millions instead of tens of miles. On the other hand, it must be remembered also that starlight passes through universal space, and is everywhere spread out therein, and that it is hardly possible to think of starlight as an existence without some sort of material reality. Some physicists believe that Encke's Comet, with its retarded motions, will some day fall into the sun; while others fancy that such a consummation can never take place, because successive portions of its substance will be thrown off by the tail-forming process with each perihelion return; so that long before the cometic mass could reach the sun, it will have been altogether dissipated into space, and nothing will be left to accomplish the final state of the fall.

The great peculiarity of cometic paths, as compared with the planetary ones, is, that they consist of ellipses of very much more eccentric proportions; and that, therefore, the bodies moving in them, go alternately to much greater and less distances from the sun than the planets do. It must not be imagined, however, that all comets revolve about the sun even in the most lengthened ellipses. Three at least—the comets of 1723, 1771, and 1818—are known to have moved along hyperbolic paths instead of parabolic or elliptical ones. These comets, therefore, can make but one appearance in our skies. Having once shown themselves there, and vanished, they are lost to us for ever. They are but stray and chance visitors to the domains of our sun, and refuse to submit themselves, with the more regular members of their fraternity, to the regulation-arrangements of our system, or to appear punctually at the systematic roll-call therein instituted. They are the true free-wanderers of the Infinite, passing from shore to shore of immensity, and presenting themselves, for short and uncertain intervals, to star after star. When they flit through our skies, they show themselves in all possible positions, and move along all possible directions. They sometimes, however, yield too much to temptation, and have to suffer the penalty of a short imprisonment in consequence. Lexell's Comet, for instance, rushed in its hyperbolic path too near to Jupiter, and was caught in the attraction of its mass, and made to dance attendance on the sun through two successive elliptical revolutions. At the end of the second, the influence that had impounded the comet came, however, into play oppositely, and restored it again to its wandering life and hyperbolic courses. Its cloudy form has not presented itself amongst our stars since 1770, when its visit was thus strangely received by Jupiter.

Twenty-three comets were seen by the naked eye during the sixteenth century, 12 were seen in the seventeenth, 8 in the eighteenth, and 9 in the first half of the nineteenth. This does not, however, give anything like an adequate idea of the number of comets really in existence. When Kepler was asked how many comets he thought there were, he answered: 'As many as there are fishes in the sea.' And modern science seems determined, that the sagacious German shall not be at fault even in this predication. Two or three fresh telescopic comets are now usually found out every year. In 1847, 178 comets were known to be moving

in parabolic orbits, and therefore to be in some way permanent connections of our world-system. Lalande has enumerated 700 comets, but Arago believes that not less than 7,000,000 exist, which fall at some time or other within the reach of our sun's influence.

THE SLEEPY LADY.

SHE is easy, good-natured, and compliant about everything but her sleep. On that point she can bear no interference and no stoppages. Unless she had it fully out every day, neither would life be worth having for herself, nor would she allow the life of any other people to be endurable. Sleep is her great gift; her body has been wonderfully constituted to take a great deal of ease. Deprive her of that, and you starve her as effectually as you famish a human being by abstraction of food. Her personal appearance confirms her philosophy; for you can detect not one particle of restlessness about her. All is soft, rounded, and woolly, as if she carried an atmosphere of deafening about with her.

It has been her habit ever since her earliest years. One of the principal anecdotes of her girlish days now remembered in her family is, that her mamma having sent on some exigency to rouse her, she faintly murmured forth, 'Not for kingdoms!' then turned on the other side, and doggedly went to sleep again. There is another story of her having had to rise one morning at half-past seven, in order to attend a friend as bride-maid, when, coming down stairs, and seeing it to be a raw drizzly day, she pronounced her situation to be 'the ne plus ultra of human misery!' She told the young bride (by way of a compliment) that she would not have got up *in the middle of the night* to be present at the marriage of any other friend on earth. This phrase might seem to most people only a pleasant hyperbole; but I am not quite sure that it was so intended. The fact is, she has seen so little of the world at any other hours than between noon and midnight, that she has a very obscure sense of other periods of daily time. She scarcely knows what morning is. Sunrise is to her as much of a phenomenon as a total eclipse of the sun to any other person. She cannot tell what mankind in general mean by breakfast-time, for she has scarcely ever seen the world so early. And really half-past seven was not very far from the middle of her night.

Her husband, who is a little of a wag, compares her waking-life to the appearance which the sun makes above the horizon on a winter day: only, her morning is about his noon. He says, however, there appears to be no necessary end to her sleep. It is like Decandolle's idea as to the life of a tree: keep up the required conditions, as sap, &c., and the tree will never decay. So, keep up the necessary conditions for her repose, and she continues to sleep. It is always some external accident of a disturbing nature which gets her up. He has sometimes proposed making an attempt so to arrange matters as to test how long she *would* sleep. But, unfortunately, he cannot provide against the disturbing effect of hunger, so he fears she might not sleep above two nights and a day at the most—a result that would not be worth the trouble of the experiment. She takes all his jokes in good-humour, as indeed she takes everything which does not positively interfere with her favourite indulgence. "Ah, little she'll reck if ye let her sleep on," ought, says he, 'to be her motto, being applicable to her in the most trying crises of life, even that of the house burning about her ears.'

He contrasts his life, which is a moderately active one, with hers. 'I went up to my dressing-room, about nine o'clock one evening, to prepare to go to a party, when the sound of heavy breathing from the neighbouring apartment informed me that she had

reached the land of forgetfulness. I went out, spent a couple of hours in conversation, had supper, set several new conundrums agoing in life, and made one or two new friends. Then I came home, had my usual rest, rose, and set to work in my business-room, where I drew up an important paper. Still no appearance of the lady. I had breakfast, read the newspaper, and played with the children. One of my new friends called, and made an appointment. Still no appearance of my wife down stairs. At length, about the middle of the day, when I was deep in a new piece of business, she peeped in, with a cold nose and fresh ringlets, to ask a cheque for her house-money—having got down stairs rather more promptly than usual that morning, in order to go out and settle her weekly bills. Thus I had a series of waking transactions last night, another this morning—in fact, a *history*—while she had been lost in the regions of oblivion. My sleep is rounded by hers, like a small circle within a large one.'

Sometimes he speculates on the ultimate reckoning of their respective lives. 'Mine,' says he, 'will have been so thickened up with doings of all kinds, that it will appear long. I shall seem to have lived all my days. I fear it must be different with yours. So much of it having been passed in entire unconsciousness, you will look back from seventy as most people do from five-and-thirty; and when Death presents his dart, you will feel like one that has been defrauded of a most precious privilege. You will go off in a state of impious discontent, as if you had been shockingly ill-used.' Such is one of his sly plans for rousing her to a sense of the impropriety of her ways; but all such quips and cranks are in vain. Only don't absolutely shake her in her bed before her thirteenth hour of rest, and you may say what you please. It cannot be implied that she is hardened, for no such quality is compatible with her character. But she smiles every joke and every advice aside with such an air of impassible benignity, that you see it is of no use to think of reforming her in this grand particular.

One day not long since it rather seemed as if she was going to turn the tables on her worthy spouse. She had a remarkable dream, in which she thought she heard a lady sing a new song. When she awoke, she remembered the two verses she thought she had heard, and they turned out to be perfectly good sense and good metre, and not intolerable as poetry. Now this was what Coleridge calls a psychological curiosity, for the verses had of course been composed by her in her sleep. There was more in the matter still. In her waking-life, she has a remarkably treacherous memory for poetry, being seldom able to repeat a single verse even of Isaac Watts without a mistake. Here, however, she had carried two entire verses safe and sound out of her sleep into her waking existence. It was therefore a double wonder. She has accordingly got up a theory, that her mind is at its best in her sleep, and is judged of at a disadvantage in its daylight moments. In sleep lies her principal life. Waking is an inferior exceptive kind of existence, into which she is dragged by the base exigencies of the world. She ought to be judged of as she is in her dreams. No saying what she goes through then. Perhaps she is the most active woman in the world in that state. Possibly she says and does the most brilliant things, such as nobody else could say or do in any condition. 'You say you cannot test it, for you cannot follow me into my dream-world. Well, but it may be as I say; and till you can prove the reverse, I hold that I am entitled to the presumption which my dream-song establishes in my favour.' It must be admitted there is some force in this reasoning. All that her husband can in the meantime say on the other side, is just this: 'Granted the activity and the brilliancy of your sleep-life, it does wonderfully little for me or our household concerns. Only give us an hour more of your sweet

company in the forenoon, and we shall admit you to be in your sleep as stirring and as clever as you choose to call yourself.' This of course he says very safely, for he well knows that no earthly consideration would induce her to abridge her sleep even by that one hour.

At a visit I lately paid to this good couple, I found them debating these points, the gentleman still refusing to give implicit credence to the theory which the lady had started in her own favour. The controversy was conducted with a great deal of good-humour, and I could not refrain from entering into the discussion. I started, however, a new theory, which I thought might please both parties, and in this object I am happy to say I was successful. 'Here,' said I, 'is a wife remarkable for putting as much good-nature into her six or eight hours of day-life as most women put into twice the time. No one can tell what she is in her sleep: perhaps the veriest termagant on earth. Suppose her sleep could be abridged, might not some of this termagantism overflow into and be diffused over her waking existence? I can well imagine this, and you, my friend, reduced to such straits by it that you might wish she would never waken more. Be content, then, and rather put up with the little ills you have than fly to others that you know not of.'

THE NEW CONVICT ESTABLISHMENT IN WESTERN AUSTRALIA.

THE subject of convict discipline has for several years past excited the attention both of legislators and philanthropists; but the knowledge of the public concerning its details has hitherto been exceedingly meagre. It is not intended in this article to discuss the abstract question of the policy of transportation to the colonies, or of convict discipline there pursued; but merely to give some account of the system adopted at a new settlement in Australia. We will state at once, that our official authority is a Blue Book—one of those huge volumes printed from time to time, by order of parliament, for the edification—or as some facetious folks say, for the mystification—of M.P.s. Having carefully waded through its voluminous pages, we have jotted down the passages that especially struck us, and propose to present the pith and substance of our labour—for it is nothing less—in a condensed and popular form.

Little more than a couple of years ago, it was resolved by government to establish a convict settlement at Fremantle—a small town, as we learn, of some 5000 inhabitants—in Western Australia. The first ship arrived in Swan River on 1st June 1850, with 75 convicts; and in October following, a second came with 100 more. Soldiers, and proper officers to control and conduct the convicts, were on the spot; and a tolerably suitable prison was forthwith extemporised out of a wool-shed or warehouse. It is this kind of temporary and experimental establishment that forms the subject of the published returns to government, which are dated up to February 1851, and include an exceedingly minute and clearly-stated detail of the operations and plans adopted during the six months ending December 31, 1850. Three hundred more convicts—principally from the Portland prison in England—were expected in February 1851, and a grand permanent prison was to be erected, to contain 500 cells.

The convicts at Fremantle are employed in both in-door and out-of-door work, but principally the latter. The artisans—*tradesmen* they are styled in the Reports—such as blacksmiths, masons, carpenters, tailors, bricklayers, &c., labour at their respective trades; and the labourers, *par excellence*, toil at road-making and various other works of public utility. The 'daily routine' is as follows:—The first bell is rung at 5 A.M., and the prisoners rise, and neatly fold up their bedding—they sleep in hammocks, we believe, as the documents

specify the beds being 'hung' at night. The second bell rings at 5.15; and they are then mustered in their several wards, and paraded. The third bell rings at 5.55, when they are minutely inspected by the proper officers, and working-parties are detailed and marched off. From this time to 7.55, the prison orderlies are busily engaged in sweeping the wards, and making preparations for breakfast. At 7.55, the bell rings, and the convicts muster, and go into breakfast. One of the prisoners is selected to say grace, and the breakfast is eaten in perfect silence. At 8.25, they leave the mess-room, and are then 'allowed to smoke in the square before the prison door till 8.45, when they must muster inside for prayers.' At 9 o'clock, the bell rings for work, and the parties are inspected and marched off. At 12 o'clock, the dinner-bell rings; but parties working at a considerable distance from the prison, are allowed to leave off work a quarter or half an hour earlier, according to the distance they have to walk to the prison. When grace after dinner—for which meal one hour seems to be allowed—is said, they are again permitted to assemble outside from 1 P.M., till resuming work. At 1.55, the 'warning-bell' rings, and the working-parties are again formed. At 3 o'clock, the bell rings, and off they march, and continue working till 6 o'clock, when they are all paraded, wash themselves, and muster for supper. At 6.15 rings the supper-bell; and after supper they are 'allowed outside' from 6.45 till 7.30, when the chaplain reads prayers. At 8 o'clock, the beds are hung, and the convicts are sent into them immediately; and the most perfect quiet is enforced till the morning.

The 'rules and regulations' to be observed by the officers of the establishment and the prisoners are very strict and minute; and, on the whole, appear to be exceedingly judicious. As a fair specimen of the sound and humane spirit that seems to pervade the regulations in question, we will only quote No. 2 of the 'General Rules'—as follows:—'It is the duty of all officers to treat the prisoners with kindness and humanity, and to listen patiently to and report their complaints or grievances, being firm at the same time in maintaining order and discipline, and enforcing complete observance of the rules and regulations of the establishment. The great object of reclaiming the prisoner should always be kept in view by every officer in the prison; and they should strive to acquire a moral influence over the prisoners, by performing their duties conscientiously, but without harshness. They should especially try to raise the prisoners' minds to a proper feeling of moral obligation, by the example of their own uniform regard to truth and integrity, even in the smallest matters. Such conduct will, in most cases, excite the respect and confidence of the prisoners, and will make the duties of the officers more satisfactory to themselves and to the public.'

With respect to the degree of communication permitted between the convicts and their friends, it is stated that a prisoner is allowed to write, or to receive a letter, once every three months; but the chaplain or the overseer reads all letters either received or sent; and if the contents appear objectionable, they are withheld. We are told in the 'Rules for Prisoners,' that no prisoner during the period of his confinement, or employment on public works, has any claim to remuneration of any kind, but that industry and good conduct are rewarded by a fixed gratuity under certain regulations, depending on the class in which the prisoner is placed; and this gratuity is credited to him at the following general rates: 1st class, 9d. per week; 2d class, 6d.; 3d class, 4d. If any misconduct themselves, they forfeit all advantages, or are subject to the minor punishment of being placed in a lower class, &c. A prisoner, by particularly good behaviour, will be eligible to receive 8d. to 6d. per week in addition to the above rates. The amounts thus credited 'will be advanced

to the prisoner under certain restrictions, or otherwise applied for his benefit, as may be considered desirable.

There are several long and extremely circumstantial tables given of the amount of work done per day, per week, per month, &c. We gather, that the estimated value of the work earned by all the convicts in the six months ending 31st December 1850, was no less than L.3128, 9s. 4d. The total number of 'non-effectives'—men unable to labour through illness or otherwise—was 40 in the six months. The total 'effective' workers, during the same time, was 586—artisans, 218; labourers, 368; and this gives the average number of effectives as nearly 98 per month; so that some idea may be formed of their individual earnings. In the month of November, the total number of effectives was 154; and they earned the large sum of L.828, 17s. 6d. During the following month of December, task-work was adopted, and the effectives, 148 in number, earned L.665, 19s. 10d. We are informed that task-work has been contrived to allow each man to do 1½ to 1½ days' work per diem, and to obtain credit for the extra amount earned. Were we, however, to take the above figures as a criterion, we should conclude that less, rather than more, was proportionately earned during the month of task-work; yet this conclusion would not be fair, for doubtless many modifying circumstances require to be taken into consideration—such as the state of the weather, the number of artisans as compared with the labourers, &c.; besides which, it must be borne in mind, that although task-work has been specially designed to benefit the convicts themselves, yet, while some would work with a will, others, and perhaps many, would prefer unremunerative idleness.

To every breach of discipline, certain punishments are allotted; some, indeed, appear very severe; and for many misdemeanours, corporal punishment is not merely held out as *terrorem*, but inflicted. Attempts at escape are liable to be punished by labour in chains, or flogging up to 100 lashes, or to a renewed sentence of transportation; and the recaptured convict has to work out the expenses of his capture, and the reward paid for the same. In the list of offences and punishments for the month of December, we see some very curious items; and, not knowing anything of the peculiar circumstances of each case, they are apt to strike one as being somewhat arbitrary. For instance, 'for refusing to work,' a man had 'bread and water for three days;' a second, 'for insubordinate conduct'—much the same thing, we should suppose, as 'refusing to work'—had the very severe punishment of 'bread and water, and twenty-eight days' solitary confinement;' a third, for 'talking to a female,' was 'admonished;' a fourth, for being 'drunk at work,' had 'bread and water for three days, and fourteen days' solitary confinement;' a fifth, 'for threatening language,' had his 'tobacco stopped for three days.' On the subject of the 'pernicious Indian weed,' there is the following passage in the Report of the comptroller-general of Fremantle:—'The issue, under his Excellency's sanction, of a small allowance of tobacco, has been appreciated as a very great boon, and has prevented many irregularities. It also furnishes an excellent means of punishment for minor offences—that is, by its stoppage.' We can well believe this. We know positively that prisoners will undergo any risk to get even a morsel of tobacco, and would gladly sacrifice a day's food for it. It is almost incredible what an intense longing for tobacco arises in the minds of those forcibly restrained from the indulgence.

Several 'tickets-of-leave' had already been granted at Fremantle; and on this subject we are presented with a mass of remarkable and instructive information. The reader is probably aware, that convicts in prison, before quitting England, are subjected to a term of hard labour—proportionate in duration to the length

of their sentences of transportation—and to a further term of hard labour on arriving in Australia. When the latter term has expired, if the prisoner has conducted himself well, he is presented with a ticket-of-leave, which confines him to a certain district, where he may engage to labour for his own benefit under an employer. He does this, however, under very strict rules, and the least transgression is punished severely. If, for instance, he leaves the district, he is liable to be apprehended, and summarily convicted by a magistrate, who may sentence him to labour in irons; or he may forfeit his ticket-of-leave, and relapse into his former situation as a convict. Or if he at all misconducts himself, or is insubordinate, his employer may carry him before a magistrate, and have him corporally punished. A list is given of the convicts who obtained tickets-of-leave at Fremantle, with their trades, and the names of their employers, and the wages they were to receive. A groom received L.12 per annum; a carpenter, L.14; a labourer, L.1 per month; a blacksmith, L.1, 8s. per month; a mason, L.1, 10s. per month; and a brickmaker, L.2, 10s. per month. Each ticket-holder must pay to the comptroller-general the sum of L.15, for the expenses of his passage out to the colony. No ticket-holder, unless under very special circumstances, gets a 'conditional pardon' till one-half of his sentence, from date of conviction, is expired; nor will he receive a conditional pardon till the whole of the L.15 is paid. 'Wives and families of well-conducted ticket-of-leave men will be sent out to them, when one-half the cost of so doing has been paid, either by themselves, their friends, or their parishes in the United Kingdom; or the expenses of their passage may be assumed as a debt by the ticket-of-leave holder, to be repaid (under a bond) by the same means as the expenses of his own passage.' This is paid by the employer handing over to the comptroller-general annually any sum not exceeding one-third of the ticket-holder's salary, and not above L.5 a year in any case, unless at the man's own desire. On the subject of this forced payment of L.15 to government, the comptroller-general in his Report animadverts strongly. He says that ticket-men will try every trick to evade it; and that many of them openly say, that the situation of a well-conducted ticket-holder is such, as to make them think it not worth while paying so much as L.15 for a conditional pardon. The employers, however, he hints, object to pay ticket-men at all; seeming to think government ought to assign them gratuitously, as was done, we believe, under the old system.

The surgeon states in his report, that the food supplied at the establishment is 'wholesome, and ample;' and the health of the convicts seems very good, for only two had died up to that time, and both of these were landed in a very debilitated condition. He states the number of convicts in January 1851 at 140.

The chaplain's report is interesting and encouraging. He says, that 'the present discipline is well calculated to maintain the habits of industry, order, and cleanliness acquired in preceding prisons;' and he speaks well of the general attention of the convicts to religious exercises. Above all, he strongly and wisely advocates the formation of a library for their use; and hints that the books selected should not merely be religious, but 'entertaining and instructive'—such as history, biography, voyages and travels, scientific books with illustrations, &c. One exceedingly interesting fact mentioned is, that certain of the best educated and most intelligent convicts have been permitted to deliver lectures to their fellow-prisoners on the subjects with which they were best conversant, and with the happiest effects. Thus, a man who had been employed in a large brewery, described the whole 'mystery' in a very able manner; a second, who was by trade a French polisher, did the same; and a third, who had been a sailor, gave two

lectures on the art of navigation, and illustrated them in capital style with diagrams drawn on a black-board. We cannot but think that the beneficial tendency of these novel prison recreations will be very great.

The Report of the comptroller-general himself is, on the whole, decidedly cheering; and he says of the convicts, that, 'taken as a body, I am inclined to believe they are anxious to do well, and by honest and steady conduct, to regain here that position they have forfeited in their native land.' When inquiring of government whether the same scale is to be adopted at Fremantle as at Van Diemen's Land, he says, that at the latter place the cost of officers—such as magistrates, superintendents, overseers, storekeepers, religious instructors, medical men, &c.—allowed for each 300 convicts, amounts to L.1837, 8s. 6d. per annum, or L.4, 9s. 2d. for each convict. This seems a large sum, and does not appear to include the heavy additional cost of warders and other prison-officers.

The necessary brevity of this article precludes any allusion to a great variety of curious and instructive details of the Fremantle 'establishment,' as it is called; but if what we have already said interests the reader, and he requires to know more, we can confidently refer him to the bulky Blue Book alluded to, with an assurance that he will there find most ample and authentic information.

THE TRIAL OF ELIZABETH CANNING.

In the year 1753, London was so deeply convulsed with a great question at issue in the criminal courts, that the peace of the city was seriously threatened. From the highest to the lowest grades, society was divided into two parties on this question; and it was impossible to speak of it at a dinner-table or in a street assemblage without exciting a dangerous quarrel. This dispute was an extravagant illustration of English zeal for justice and fair play. The real question lay between an old gipsey woman and a young servant-girl. The question at issue was—Had the gipsey robbed and forcibly confined Elizabeth Canning, or had Elizabeth Canning falsely accused the gipsey of these outrages? By the force of incidental circumstances, the question came to be a really important one, in which the statesmen and jurists of the age took a lively interest. In fact, it connected itself with the efficacy of the great judicial institutions of the land, and their capacity to do justice and protect innocence. Hence the several trials and inquiries occupy as much space in the *State Trials* as three or four modern novels. In giving our readers an outline of the events so recorded, only the more prominent and marked features of them can of course find room.

Elizabeth Canning, a young woman between eighteen and nineteen years of age, had borne an unexceptionable character, and was a domestic servant in the house of a gentleman living in Aldermanbury, named Edward Lyon. On the 1st of January 1753, she obtained liberty to pay a visit to her uncle, who lived at Saltpetre Bank. As she did not return at the specified time, Mr Lyon's family made inquiry of her mother about her, and learned that she had not made her appearance among her other relations after the visit to her uncle. Days and weeks passed, in which every inquiry was unavailingly made after her, and her mother suffered intense anxiety. Public notice had been taken of the mystery; it was commented on in the newspapers, and much talked of. At length, at the end of January, Elizabeth entered her mother's house in a wretched condition—emaciated and exhausted, and with scarcely a sufficiency of clothes on her person for mere decorum. She was, of course, asked eagerly to give an account of her misfortune. Her narrative by degrees resolved itself into this shape: She set out on her visit at eleven o'clock in the day, and stayed with her uncle till nine o'clock

in the evening. Her uncle and aunt accompanied her as far as Aldgate. Then setting off alone, as she crossed Moorfields, and passed the back of Bethlehem Hospital, two stout men seized her. 'They said nothing to me,' she said, 'at first, but took half a guinea, in a little box, out of my pocket, and three shillings that were loose. They took my gown, apron, and hat, and folded them up, and put them into a greatcoat pocket. I screamed out; then the man who took my gown put a handkerchief or some such thing in my mouth.' They then tied her hands behind her, swore savagely at her, and dragged her along with them. She now, according to her own account, swooned, and on recovering from her fit, she felt herself still in their hands; they were swearing, and calling on her to move on. Partly insensible, she was conveyed for a considerable distance, but could not say whether she was dragged or carried. When she found herself at rest, it was daylight in the morning. She remembered being in a disreputable-looking house, in the presence of a woman, who said if she would accompany her, she should have fine clothes. Elizabeth refused, and the woman taking a knife from a dresser, cut open her stays, and removed them. The woman and the other people present then hustled her up stairs into a wretched garret, and locked the door. She found here a miserable straw-bed, a large black pitcher nearly full of water, and twenty-four pieces of bread, seeming as if a quarter-loaf had been cut in so many pieces. Her story went on to say, that she remained in this place for four weeks, eating so much of the bread and drinking a little water daily, till both were exhausted. She then succeeded in making her escape, by removing a board which was nailed across a window. 'First,' she said, 'I got my head out, and kept fast hold of the wall, and got my body out; after that, I turned myself round, and jumped into a little narrow place by a lane, with a field beside it. Having nothing on but 'an old sort of a bedgown and a handkerchief, that were in this hay-loft, and lay in a grate in the chimney,' she managed to travel twelve miles through an unknown country to her mother's house, not daring, as she said, to call at any place by the way, lest she should again fall into the hands of her persecutors.

If Elizabeth's absence created excitement, her reappearance in the plight she was in, and with such a story to tell, increased it tenfold. She was an attractive-looking girl; and seeing the sympathy she excited, had no objection to assent to the theory formed by her friends, that the people in whose hands she had fallen had the basest designs upon her; that they had resolved to conquer her virtue by imprisonment and starvation; and that she had magnanimously and patiently resisted all their efforts. The story was hawked about everywhere. It was spoken of in every tavern and at every dinner-table. The indignation of many respectable citizens was roused. They were parents, and had daughters of their own, who might be made the victims of the diabolical crew from which this poor girl had escaped. Many of them resolved to rally round her—to avenge her wrongs, and punish the perpetrators. Elizabeth found herself one of the most important people in London. She received many presents, and considerable funds were raised to prosecute the inquiry. In these circumstances, she was bound of course to assist her friends by remembering every little incident that could lead them to the place of her sufferings. She believed that it must have been on the Hertford road, for in looking from the window, she had caught sight of a coach on that road with which she was familiar, as a former mistress had been accustomed to travel in it. This circumstance, with the distance travelled by the girl, afforded her champions a clue, and they concentrated their researches at Enfield Wash. There they found a questionable-looking lodging-house kept by a family of the name of Wells, which seemed to

answer to Elizabeth's description. It had a garret with an old straw-bed, and a black pitcher was found in the house.

Elizabeth was taken to examine this house in a sort of triumphal procession. Her friends went on horseback, making a complete cavalcade; she and her mother travelled in a coach. As many as could find room seem to have simultaneously rushed into the squalid lodging-house, and the natural astonishment and confusion of its inmates on such an invasion were at once assigned as the symptoms of conscious guilt. Elizabeth seemed to be at first somewhat confused and undecided; these symptoms were attributed to the excitement of the moment on recollection of the horrors she had endured, and to a feeling of insecurity. She was told to take courage; she was among her friends, who would support her cause; and she at last said decidedly, that she was in the house where she had been imprisoned. A gipsy woman of very remarkable appearance was present. One of the witnesses recognised her, from her likeness to the portraits of Mother Shipton the sorceress. She sat bending over the fire smoking a pipe, and exhibiting through the hubbub around the imperturbable calmness peculiar to her race. Elizabeth immediately pointed to her, and said she was the woman who had cut her stays, and helped to put her in her prison-room. Even this did not disturb the stolid indifference of the old woman, who was paying no attention to what the people said. When, however, her daughter stepped up and said: 'Good mother, this young woman says you robbed her,' she started to her feet, turned on the group her remarkable face, and said: 'I rob you! take care what you say. If you have once seen my face, you cannot mistake it, for God never made such another.' When told of the day of the robbery, she gave a wild laugh, and said she was then above a hundred miles off in Dorsetshire. This woman was named Squires. Her son, George Squires, was present. Elizabeth did not seem completely to remember him at first, but she in the end maintained him to be one of the ruffians who had attacked her in Moorfields. Her followers were now eminently satisfied. All the persons in the house were seized, and immediately committed for examination. The strange, wild aspect of the gipsy seems to have added an element to the horrors of the affair; and in the afternoon, when two of Elizabeth's friends were discussing the whole matter over a steak in the Three Crowns at Newington, one of them said to the other: 'Mr Lyon, I hope God Almighty will destroy the model that he made that face by, and never make another like it.' It was found that Mrs Wells, who kept the lodging-house, belonged to a disreputable family, and she admitted that her husband had been hanged. If Elizabeth had given a false tale to hide the questionable causes of her absenting herself, she had probably found that it took a much more serious turn than she intended, and she must now make up her mind to recant her tale or go through with it. She resolved on the latter course, to which she was probably tempted by having all London to back her. She could not well have carried on the charge alone, but the popularity of her cause brought her unexpected aid. A woman named Virtue Hall, who lived in Mrs Wells's lodging-house, thought it would be a good speculation to be partner with Elizabeth Canning, and she gave testimony which corroborated the whole story.

On the 21st of February, Mary Squires and Susannah Wells were brought to trial for a capital offence. The evidence adduced against them was the story just told. When Mrs Squires was called on for her defence, she gave a succinct account of how she had from day to day gone from one distant place to another during the time when Elizabeth said she was in confinement. Two or three witnesses came forward somewhat timidly to corroborate her statement; and it is a melancholy fact, that others would have appeared and offered

convincing testimony of the innocence of the accused, but were intimidated by the ferocious aspect of the London populace from venturing to give their evidence. That it was not very safe to contradict the popular idol, Elizabeth Canning, was indeed experienced in a very unpleasant way by the witnesses John Gibbons, William Clarke, and Thomas Greville, who came forward in favour of Squires. Money was collected to prosecute them for perjury. Dreading the strength of the popular current against them, they had to incur great expense in preparation for their defence. Before the day of trial, however, some of Canning's champions began to feel a misgiving, and no prosecutor appeared. The counsel for the accused complained bitterly of the hardship of their position. They had incurred great expense. They felt that it was necessary for the complete removal of the stain of perjury thrown on their character, that there should be a trial. They said they had witnesses 'ready to give their testimony with such clear, ample, convincing circumstances, as would demand universal assent, and fully prove the innocence of the three defendants, and the falsity of Elizabeth Canning's story in every particular;' whereas, without a trial, all would be virtually lost to the accused, who, instead of obtaining a triumphant acquittal, might be suspected of having agreed to some dubious compromise.

Mrs Squires was at length convicted, and had judgment of death. But Sir Crisp Gascoyne, the lord mayor of London, who was nominally at the head of the commission for trying Squires, believed that she was the victim of falsehood and public prejudice. He resolved to subject the whole question to a searching investigation, and to obviate, if possible, the scandal to British institutions, of perpetrating a judicial murder, even though the victim should be among the most obscure of the inhabitants of the realm. In the first place, an inquiry was instituted by the law-officers of the crown, the result of which was, that the woman Squires received a royal pardon. The lord mayor, however, having satisfied himself that this poor woman had but narrowly escaped death from the perfidious falsehood of Elizabeth Canning, aided by an outbreak of popular zeal, was not content with the gipsy woman's escape, but thought that an example should be made of her persecutor. Accordingly, although he was met with much obloquy, both verbal and written—for controversial pamphlets were published against him as an enemy of Elizabeth Canning—he resolved to bring this popular idol to justice.

On the 29th of April 1754, she was brought to trial for wilful and corrupt perjury. Her trial lasted to the 13th of May. It is one of the longest in the collection called the *State Trials*, and is a more full and elaborate inquiry than the trial of Charles I. The case made out was complete and crushing, and the perfect clearness with which the whole truth connected with the movements from day to day, and from hour to hour, of people in the humblest rank was laid open, shews the great capabilities of our public jury-system for getting at the truth. One part of the case was, the absurdity of Elizabeth Canning's story, and its inconsistency, in minute particulars, with itself and with the concomitant facts. When her first description of the room, in which, she said, she was shut up, was compared with the full survey of it afterwards undertaken, important and fatal discrepancies were proved. She professed to have been unable to see anything going on in the house from her place of confinement, but in the room at Enfield Wash there was a large hole through the floor for a jack-rope, which gave a full view of the kitchen, where the inmates of the house chiefly resorted. She professed to describe every article in the room she was confined in, but she had said nothing of a very remarkable chest of drawers found in that which she identified as the same. That this piece of furniture had not been recently placed there was made evident, by the damp dust gluing it to

the wall, and the host of spiders which ran from their webs when it was removed. She had escaped by stepping on a penthouse, but there was none against the garret of Mrs Wells's house; the windows were high, and she could not have leaped to the ground without severe injury. She stated that no one had entered the room during the four weeks of her imprisonment, but it was shewn that, during the period, a lodger had held an animated conversation from one of the windows of the identical garret with somebody occupied in lopping wood outside. Nay, a person had seen a poor woman, with the odd name of Natis, in bed in that very room. His reason for entering it was a curious one, which has almost a historical bearing. He went to try the ironwork of a sign which had once hung in front of the house, and lay in the garret. The sign had been taken down when the Jacobite army penetrated into England in the Rebellion of 1745. Probably it had been of a character likely to be offensive to the Jacobites, and its removal is a little incident, shewing how greatly the country apprehended a revolution in favour of the Stuarts.

These discrepancies were, however, far from being the most remarkable part of the evidence. Not content with shewing that Elizabeth Canning had told falsehoods, the prosecutor set to the laborious task of proving where the gipsy woman had been, along with her son and daughter, charged as her accomplices, during the time embraced by the mere active part of Elizabeth's narrative. From the vagrant habits of the race, evidence to the most minute particulars had thus to be collected over a large range of country; and the precision with which the statements of a multitude of people—of different ranks and pursuits, and quite unknown to each other, as well as to the person they spoke of—are fitted to each other, is very striking and interesting. The most trifling and un consequential-looking facts tell with wonderful precision on the result. Thus a lodging-house keeper remembered the woman Squires being in her house on a certain day, and she made it sure by an entry in an account-book, as to which she remembered that she had consulted the almanac that she might put down the right day. The day of the woman's presence in another place was identical with the presence of an Excise surveyor, and the statements of the witnesses were tested by the Excise entry-books. The position of the wanderers was in another instance connected with the posting of a letter, and the post-office clerks bore testimony to the fact, that from the marks on the letter it must have been posted on that day. It was, as we have seen, on the 1st of January that Elizabeth Canning said she was seized. The journey of the gipsy family is traced from day to day through distant parts of England, from the preceding December down to the 24th of January, which was the day of their arrival at Enfield Wash. Thus fortified by counteracting facts of an unquestionable nature, the counsel for the prosecution felt himself in a position to turn the whole story into ridicule, and shew the innate absurdity of what all London had so resolutely believed.

He proceeded in this strain: 'Was it not strange that Canning should subsist so long on so small a quantity of bread and water—four weeks, wanting only a few hours? Strange that she should husband her store so well as to have some of her bread left, according to her first account, till the Wednesday; according to the last, till the Friday before she made her escape; and that she should save some of her miraculous pitcher till the last day? Was the twenty-fourth part of a sixpenny loaf a day sufficient to satisfy her hunger? If not, why should she defer the immediate gratification of her appetite in order to make provision for a precarious, uncertain futurity? Shall we suppose some revelation from above in favour of one of the faithful? Perhaps an angel from heaven appeared to this mirror of modern

virtue, and informed her, that if she eat more than one piece of bread a day, her small pittance would not last her till the time she was to make her escape. Her mother, we know, is a very enthusiastical woman—a consulter of conjurors, a dreamer of dreams; perhaps the daughter dreamed also what was to happen, and so, in obedience to her vision, would not eat when she was hungry, nor drink when she was thirsty. However that was, I would risk the event of the prosecution on this single circumstance, that, without the interposition of some preternatural cause, this conduct of the prisoner's must appear to exceed all bounds of human probability.'

Notwithstanding the conclusive exposure of her criminality, Elizabeth Canning was not entirely deserted by her partisans to the last. Two of the jury had difficulty in reconciling themselves to the verdict of guilty, suggesting that her story might be substantially correct, though undoubtedly she had made a mistake about the persons by whom she was injured. There was a technical imperfection in the verdict, and her friends strove to the utmost to take advantage of it. When it was overruled, and a verdict of guilty was recorded, she pleaded for mercy, saying that she was more unfortunate than wicked; that self-preservation had been her sole object; and that she did not wish to take the gipsy's life. The punishment to be inflicted on her was a matter of serious deliberation, as many of the common people were still so unconvinced of her wickedness, that an attempt to break the jail in which she was imprisoned might be feared, and as at that time the transportation system had not been established. It was not, however, unusual to send criminals, by their own consent, to the plantations, and the court gladly acceded to a desire by her relations, that she should be banished to New England.

THE ISLAND OF ISLAY.

There is, perhaps, no country in Europe which possesses so great a variety of territory and social condition as our own. Between the plains of Cambridgeshire and the wilds of Sutherland—between the toiling, densely-packed multitudes of Lancashire and the idle, scattered cotters of the Hebrides, how vast a difference! The *Land we Live in*, as Charles Knight has called it, in a very delightful descriptive book, is a much more interesting study to its own people than is generally supposed; and we somewhat wonder that comparatively so few of our tourists go in search of what is picturesque, romantic, and novel within our own seas. These ideas arise in our mind in perusing a few pages of the new edition of the *Guide to the Highlands and Islands of Scotland*,* by the Messrs Anderson of Inverness. In this book we have the benefit of remarkable fulness of knowledge on the part of the authors, and the accuracy of their statements is only rivalled by their judicious brevity. The account of some of the more out-of-the-way parts of the country brings before us not merely physical conditions highly peculiar, but, as it were, a totally peculiar set of historical associations. As an example, take a few swatches of the Island of Islay.

It is about thirty miles long by twenty-four in breadth, composed chiefly of elevated, but not Alpine ground, much of it moorish and bleak, but a great and constantly increasing space cultivated and sheltered. The finest island in the Hebrides, it belonged almost wholly to one proprietor, whose dignity of course was great. Within the last few years, he came to greet the Queen at Inverary, with a gallant following of men clothed in the Highland garb at his own expense. The island is now, however, in the hands of trustees, for the benefit of creditors, whose claims amount to upwards of £700,000. There are lead-mines on the island, not unwrought, but from which it is understood silver had

been derived, wherewith some of the family plate of the proprietor was formed. Whisky is distilled to such an amount, as to return £80,000 per annum of revenue to the government. The Gaelic-speaking people, the fine shooting-grounds, the romantic cliffs and caves, the lonely moors and lochs of this island, altogether give it a degree of romantic interest calculated strongly to attract the regard of the intelligent stranger.
